Airfoil noise radiated spectrum has two components: broadband noise and a set of pure tone peaks. A farfield array has enabled the authors to determine the pure tone source location. A nearfield array placed in the vicinity of the airfoil has given the directivity of both types of sources, even in the downstream direction, when the array is imbedded in the flow. (8 refs.)

61349 The tight-coupled monopole active attenuator in a duct. Kh.Eghtesadi (Dept. of Electrical Engng., Abadan Inst. of Technol., Abadan, Iran), W.K.W.Hong, H.G.Leventhal.

Noise Control Eng. J. (USA), vol.20, no.1, p.16-20 (Jan.-Feb. 1983).

Methods of active attenuation of noise, that is the cancelling of noise from a source by the addition of further noise, include both absorptive and non-absorptive systems. The paper reviews the theory of one-dimensional active attenuation for ductborne noise and follows with an overview of a monopole system used to realize attenuation. A number of configurations of active attenuators are possible. In these, one, two or three sources have been used to produce the secondary cancelling noise. The tight-coupled monopole attenuator uses a completely different approach to the question of acoustic feedback to other attenuation systems. Previous approaches have always been to isolate the attenuator microphone from acoustic feedback from the attenuator loudspeakers; most systems use an acoustic method of achieving this, while the chelsea monopole attenuator uses an electronic method. In the tight-coupled monopole attenuator the acoustic feedback can be used as an integral part of the system in order to provide automatic compensation. This leads to a simple attenuation system which can be constructed from standard equipment, without special electronic systems. The experimental results showed significant attenuation. (22 refs.)

61350 Barrier insertion loss versus Fresnel number and secondary parameters. Z.Hu, R.L.M.Wong (Inst. for Aerospace Studies, Univ. of Toronto, Downsview, Ontario, Canada).

Noise Control Eng. J. (USA), vol.20, no.1, p.31-6 (Jan.-Feb. 1983).

The authors provide a quick, but accurate, estimation of sound reduction by a semi-infinite barrier for a wide range of source/observer geometries. In addition to Fresnel number N (in a range down to 0.05), it brings out the influence of three secondary parameters; although often neglected, these can be significant. The insertion loss for a pure tone point source is computed via the exact solution given by both Carslaw (1899) and Macdonald (1915). The numerical results are approximated analytically by modifying the diffraction formulation of Keller (1962) and others. The approximate formulae are applied to several test cases and agree well with the exact theory and experimental measurements. (11 refs.)

61351 Errors induced by analog to digital conversion over a wide dynamic range. C.Azais, J.P.Guilhot (LAMI Univ. Paul Sabatier, Toulouse, France).

Rev. Acoust. (France), vol.15, no.63, p.216-20 (1982). In French.

Digital analysis of an acoustical signal is based on analog to digital conversion over a wide dynamic range. The authors made a comparison between several types of converters, taking as a criteria the relative error on the estimate root mean square value of a signal of known probability density function. They propose a device making a floating point conversion over a 95 dB wide dynamic range with an error less than ± 0.2 dB. (no refs.)

43.70 SPEECH COMMUNICATION

(inc. speech perception, speech intelligibility, and speech synthesis; see also 87.36 Speech)

61352 Selective linear prediction of speech using the generalized inverse of matrices. R.Mizoguchi, M.Yanagida, Y.Taniguchi, O.Kakusho (Inst. of Sci. & Industrial Res., Osaka Univ., Ibaraki, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Part A (Japan), vol.J66A, no.1, p.56-63 (Jan. 1983). In Japanese.

The authors present a new approach to LPC analysis based on selective use of speech data to reject the data disturbed by the excitation source. This is called the selective linear prediction method. First, the formulation of linear prediction is presented using the generalized inverse matrices. Then, a successive computation is described based on Givens' reduction. The selective computation, which plays an essential role in the method, owes its efficiency to Givens' reduction. Finally, the advantage of the proposed method is demonstrated by computer simulation using both synthetic and natural speech. (12 refs.)

61353 Isolated words recognition using DP-matching and Mahalanobis' distance. T.Takara, S.Imai (Res. Lab. of Precision Machinery & Electronics, Tokyo Inst. of Technol., Yokohama, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Part A (Japan), vol.J66A, no.1, p.64-70 (Jan. 1983). In Japanese.

The authors propose a new DP-matching method in which the covariance matrix for each frame absorbs the variation of phonemic characteristics among the speakers. The method maximizes a likelihood, and both the calculations and memory size necessary for the recognition can be kept as small as possible, since the conventional spectral representation is not needed for the feature parameter. Using the Fourier transform of Mel-Sone spectrum (3 dimensional vector) as the feature parameter, the ten Japanese digits spoken by 8 males were examined. The recognition scores of 95.4% and 98.8% were obtained in speaker and utterance open tests, respectively. (7 refs.)

43.75 MUSIC AND MUSICAL INSTRUMENTS

61354 Anomalies in the frequency-length functions in violin strings. N.C.Pickering (Norman Pickering Co., Southampton, NY, USA).

J. Audio Eng. Soc. (USA), vol.31, no.3, p.145-50 (March 1983).

A computer-controlled machine has been constructed which accurately stops the string of a violin at known positions. The string is excited electromagnetically at each position and the frequency measured. Correlation between body resonances and frequency perturbations is clearly demonstrated. Errors, often attributed to 'false' strings, are inherent, and of the order of 10-30 cents. Violins vary widely. (5 refs.)

61355 Hearing the shape of an annular drum. H.P.W.Gottlieb (School of Sci., Griffith Univ., Nathan, Queensland, Australia).

J. Aust. Math. Soc. Ser. B (Australia), vol.24, pt.4, p.435-8 (April 1983).

The asymptotic expansion for a spectral function of the Laplacian operator, involving geometrical properties of the domain, is demonstrated by direct calculation for a doubly-connected region in the form of a narrow annular membrane. From a known formula for the zeros of the eigenvalue equation containing Bessel functions the area total perimeter and connectivity are all extracted explicitly. (10 refs.)

43.85 ACOUSTICAL MEASUREMENTS AND INSTRUMENTATION

(for acoustic noise measurement, see also 43.50; for photoacoustic spectroscopy, see 07.65)

61356 The spark generator as an impulsive acoustic signal source. C.B.Chinoy (Univ. of Wales Inst. of Sci. & Technol., Cardiff, Wales).

Acoust. Lett. (GB), vol.6, no.4, p.44-51 (Oct. 1982). [received: March 1983]

The application of impulse analysis techniques to acoustical systems offers the acoustician both a powerful design and diagnostic method of investigating the characteristics of transmission channels. This paper considers one of the most suitable means of generating input signals for this application—the utilisation of a spark generator as an impulsive signal source. The main requirements of an impulsive signal to be used to investigate sound transmission characteristics through buildings are discussed and the theoretical background, design, construction and performance of a spark generator are described. (3 refs.)

61357 Errors combination in acoustical measurements. J.Guilhot, C.Legros, J.P.Flenner.

Rev. Acoust. (France), vol.15, no.63, p.221-3 (1982). In French.

The error on a measurement depends upon the precision of the device and the random properties of the phenomenon. In acoustical measurements, one knows the precision of the device only by partial tolerances. Furthermore, each physical phenomenon is a particular case. Collecting what is known in this domain, the authors tried to estimate the overall error on an acoustical measurement in some usual cases. (7 refs.)

61358 Study and synthesis of signal types with a view to the testing of L_{eq} meters. M.Labit, J.P.Grasmuck (LAMI, Univ. Paul Sabatier, Toulouse, France).

Rev. Acoust. (France), vol.15, no.63, p.224-9 (1982). In French.

Proposes a method for testing integrating sound level meters. After some generalizations about the errors due to the measurement, the authors discuss: (1) A method for typing different acoustic signals. Traffic noise has been especially studied. (2) A method of digital generation of random noise and the description of an automatic testing bench for integrating sound level meters. (9 refs.)

61359 Application of ultrasonic microscopy to the investigation of mechanical properties and defects in solids. J.Attal (CNRS, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).

Rev. Acoust. (France), vol.15, no.63, p.231-3 (1982). In French.

A mechanical scanned acoustic microscope is described operating in the 0.6-1.2 GHz range specially devoted to the interior resolution of $5 \mu\text{m}$ and a depth penetration of several hundreds of microns, such a technique appears useful in various nondestructive tests, metallography and biological tissues. (3 refs.)

61360 Improved technique for amplitude inversion of backscattering in the study of cavities and flat defects. F.Cohen-Tenoudji (Ecole Normale Supérieure, Univ. Paris VII, France), B.R.Tittmann, G.Quentin. *Rev. Acoust. (France)*, vol.15, no.63, p.239-41 (1982). In French. A technique is proposed for the inversion of elastic scattering data in order to extract the geometrical properties of a scatterer embedded in a solid. The technique is partly based on the Kirchhoff approximation but goes much further by taking into account waves travelling on the scatterer in the shadow region. Results are presented for 'exact' theoretical and experimental data. (7 refs.)

61361 Technique for measurement of ultrasonic velocity with sing-around system. V.S.Soitkar, K.P.Sunnapwar, G.N.Navaneeth (Dept. of Phys., Nagpur Univ., Nagpur, India). *CSIO Commun. (India)*, vol.9, no.1, p.30-9 (Jan.-March 1982). [received: March 1983]

A solid state sing-around system developed by the authors has been successfully used to determine ultrasonic velocity in aqueous solutions of sulphuric acid of very weak concentrations. The authors present details of two mechanical assemblies used and of the time decay averaging method employed to increase the time resolution and, hence, the accuracy of the method. The results are compared with the data in the literature. An accuracy of 1 part in 10^4 has been obtained for determination of ultrasonic velocity from changes in delays. The system can be suitably employed to measure ultrasonic velocity in other liquids. (20 refs.)

61362 A new measurement method for separating airborne and structure-borne aircraft interior noise. M.C.McGary, W.H.Mayes (Noise Effects Branch, NASA Langley Res. Center, Hampton, VA, USA). *Noise Control Eng. J. (USA)*, vol.20, no.1, p.21-30 (Jan.-Feb. 1983).

Presents a new measurement method for separating airborne and structure-borne noise in propeller driven aircraft. The theory of the measurement method and the results of two experiments designed to validate the theory are presented. The method is based on the two-microphone cross spectral acoustic intensity measurement method and the theory of sound radiation of plate and thin shell structures. The measurements were performed on a plexiglass sheet mounted in the NASA Langley Research Center Noise Transmission Loss Facility and on a Beechcraft Baron fuselage. (23 refs.)

61363 Sound power determination from surface intensity measurements on a vibrating cylinder. N.Kaemmer, M.J.Crocker (Ray W. Herrick Labs., School of Mech. Engrg., Purdue Univ., West Lafayette, IN, USA). *J. Acoust. Soc. Am. (USA)*, vol.73, no.3, p.856-66 (March 1983).

The feasibility of using surface intensity measurements for the determination of sound power as a tool for noise source identification was studied with an experiment on a circular cylinder. This cylinder was an idealized model of a muffler shell of a heavy diesel truck. Two experiments were performed with the cylinder excited by an electromagnetic shaker. In the first one, the shaker was driven with a one-third octave band of white noise centered at 6300 Hz and in the second experiment it was driven with broadband white noise between 1000 and 5000 Hz. The sound power measurements were made in a reverberant room and the reverberant room method was used to provide a comparison with the sound power levels obtained from the surface intensity measurement. The acoustic surface intensity was computed from the cross-spectral density between the acoustic pressure and the normal surface velocity of the cylinder. An equation was developed to allow for inclusion of a correction for phase shifts that were caused by the instrumentation and by the finite distance between the microphone and the vibrating surface. The phase shift resulting from this distance was found to have a dominant effect in the higher frequency range and it was important to make these phase-shift corrections in order to obtain accurate measurements of sound power. After including these phase-shift corrections, reasonably good agreement was achieved between the sound power levels obtained from the surface intensity measurements and those from the reverberant room method. (21 refs.)

61364 Continuous-wave acoustic velocimeter with feedback. S.R.Stefanov, Yu.P.Chistoserdov. *Meas. Tech. (USA)*, vol.25, no.8, p.716-18 (Aug. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.8, p.70-1 (Aug. 1982). [received: April 1983]

The authors have developed an acoustic velocimeter in which the phase method with a frequency output is implemented in a simple form by means of an arrangement for the radiation and reception of acoustic waves with positive feedback. This arrangement has the same advantages for field experiments as the sing-around technique, but can provide significantly higher sensitivities. Further improvement can be achieved by means of an arrangement with two closed loops (two receivers). Theoretical and experimental investigations have indicated that the two-receiver configuration has a number of advantages over other acoustic velocimeters and can be operated in various liquid and gases. (3 refs.)

61365 Automatic echo selection logic for ultrasonic attenuation measurement system. L.Pathak, N.Murali, S.U.Rani (Reactor Res. Centre, Kalpakam, India). *Rev. Sci. Instrum. (USA)*, vol.54, no.4, p.482-5 (April 1983).

A simple low-cost circuit for automatic selection of two successive echoes during measurement of ultrasonic attenuation is described. When ultrasonic attenuation is measured as a function of a varying parameter like temperature, the transit time through the sample also changes, resulting in the shift of echo positions. This calls for manual adjustment of sample pulses used for sample and hold circuits. The present logic eliminates the need for manual adjustment. Details of the logic circuitry along with salient features of peak detectors and sample-and-hold circuits used are described. The results of performance tests are presented. (5 refs.)

61366 Acoustic polarizer using an electrically controlled piezoelectric element. E.K.Grishchenko (N.N. Andreev Acoustics Inst., Acad. of Sci., Moscow, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.7, p.340-1 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.785-8 (July 1982). [received: April 1983]

Reports preliminary results of experiments on a controllable acoustic polarizer using an electrically controllable piezoelectric device. The rotation of the plane of polarization of the acoustic wave introduced by the electrically controllable piezoelectric device was measured on an apparatus designed for studying delay lines. (7 refs.)

61367 Surface-acoustic-wave diffraction grating from thin zinc oxide films. I.M.Grarkin, Yu.V.Nepochatkykh.

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.424-5 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.981-4 (Aug. 1982). [received: April 1983]

Reports a study of a diffraction grating made from islands of a three-layer metal-zinc-oxide-metal film system on a fused quartz substrate. The experiments show that the necessary 180° phase shift between the oscillations in the SAW beams propagating along the free surface and along the surface covered

by the multilayer system can be achieved over the calculated path length, but the region of the transition from one oscillation phase to the other as the probe beam moves along the SAW front is $\approx 5\lambda$, where λ is the SAW wavelength. The period of the phase grating thus cannot be smaller than 10λ . (3 refs.)

61368 An acoustical synthetic focus imaging with pseudo-random signal. K.Nagai, S.Sano (Inst. of Appl. Phys., Univ. of Tsukuba, Ibaraki, Japan). *Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan)*, vol.J66C, no.1, p.108-9 (Jan. 1983). In Japanese.

A new synthetic focus digital acoustic imaging technique is described. The technique uses correlation of m -sequence signals to get prolonged impulse responses, by which digital images of objects are reconstructed. The result of the basic experiment is also presented to demonstrate the discussion. (5 refs.)

61369 Methods and feasibilities for the determination of the power radiated by an acoustic source. I. Survey about the traditional methods for estimating the sound power. I.Veit (Fraunhofer Inst. für Bauphys., Stuttgart, Germany).

Tech. Mess. tm (Germany), vol.50, no.3, p.87-92 (March 1983). In German. The sound power radiated by an acoustic source cannot be measured directly. Practical test conditions which have to be taken into account in estimating the radiated power from measurements of the sound pressure are discussed. Some new techniques for estimating the radiated power are discussed following a review of more traditional methods. One new technique that is becoming increasingly important utilizes the sound intensity and is based on measurement of the cross-spectral density function $K_{12}(\omega)$. The principle that underlies this approach is discussed. A novel sound power estimation procedure, the so-called phase gradient method, is also described. (19 refs.)

61370 Principle of piezoelectric frequency-tunable transducer. Wang Chen-hao, Zhao Zhe-ying (Inst. of Acoustics, Acad. Sinica, Peking, China).

Acta Acust. (China), vol.7, no.6, p.364-71 (Nov. 1982). In Chinese. Recently, the effect of electric load on the characteristics of a piezoelectric vibration system has been obtained. The resonant frequency of such a system changes continually with the changing of the electric load. In accordance with this effect, the authors made piezoelectric frequency-tunable transducers. In this paper, the principle of this frequency-tunable piezoelectric transducer is described. The authors theoretically analyse the piezoelectric frequency-tuning of the sandwich transducers and experimentally investigate a sandwich transducer of length-vibration bar with field parallel to length. The theoretical and experimental results show that such frequency-tuning is available at one and half octaves. For piezoelectric frequency-tunable transducer, the frequency tuning is convenient, continual and instantaneous. (4 refs.)

61371 Wedged ultrasonic transducers having thickness extensional vibration. T.Kobayashi (Coll. of Engrg., Nihon Univ., Koriyama, Japan). *J. Acoust. Soc. Jpn. (Japan)*, vol.38, no.12, p.748-54 (Dec. 1982). In Japanese.

Usually, ultrasonic transducers can only radiate ultrasonic waves of a narrow bandwidth, but it is possible to make a broad bandwidth by making a wedged type. The wedged transducers are made of PZT having thickness extensional vibration. The fundamental characteristics of them are investigated, and applications using them are attempted. First, the frequency characteristics of the free impedance and of the phase of the wedged transducers are measured. Also, the radiation patterns are observed using the schlieren method. Next, for the applications using those transducers, two experiments are attempted. One is the ultrasonic radiation of a broad bandwidth toward one direction using the semicylindrical wedged transducer. The other is the ultrasonic thickness measurement with resonance technique using the plate wedged and semicylindrical wedged transducer. (12 refs.)

61372 The effect of Fe-Ni films on the insertion loss of SAW. H.Yoshida, K.J.Sun, J.Schmidt, M.Levy (Phys. Dept., Univ. of Wisconsin, Milwaukee, WI, USA).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.178-80 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The insertion loss of 618 MHz quartz SAW delay lines with nickel-rich Fe-Ni alloy films deposited between the interdigital electrodes exhibits as large a response to an applied magnetic field as that observed with pure nickel films. In addition, the alloys exhibit an enhanced domain wall motion effect. (5 refs.)

44.00 HEAT FLOW, THERMAL AND THERMODYNAMIC PROCESSES

44.10 HEAT CONDUCTION (MODELS, PHENOMENOLOGICAL DESCRIPTION)

61373 Insulating circular rugs. G.J.Weir (Appl. Math. Div., DSIR, Wellington, New Zealand).

J. Aust. Math. Soc. Ser. B (Australia), vol.24, pt.4, p.359-65 (April 1983). A thin, partially insulating circular rug is placed on a uniform half-space up through which a steady heat flow passes. The corresponding dual integral equations are solved using Tranter's method, finite Legendre transforms and Mellin-Barnes contour integrals. An untabulated Bessel (or Stieltjes) transform similar to the discontinuous Weber-Schafheitlin integral is evaluated, and a simple expression derived for the rug's surface temperature. (5 refs.)

61374 Investigation of transient temperature fields by electrical analogy. A. Faludi.

Meres & Autom. (Hungary), vol.31, no.2, p.68-71 (1983). In Hungarian. The author describes an electrical analog model constructed from active and passive electronic units which can be advantageously used for testing two-dimensional transient temperature fields. The electrical model consists of small uniform cubes with several kinds of functions. Thus, one can easily and quickly model cases of various geometry and different boundary conditions. Because of the rapid variational possibility and the stability of the solution the use of the electrical analogy can be put next to the numerical methods carried out by up-to-date computers. The practical application is briefly outlined through examples. (4 refs.)

44.25 CONVECTIVE AND CONSTRAINED HEAT TRANSFER

(see also 47.25Q Convection and heat transfer)

61375 Heat transfer in subcooled liquid cryogenics. Yu.A.Kirichenko, K.V.Rusanov, E.G.Tyurina (Phys.-Tech. Inst. of Low Temperature, Acad. of Sci., Kharkov, Ukrainian SSR).

Cryogenics (GB), vol.23, no.4, p.209-11 (April 1983). An experimental study of heat transfer in helium, hydrogen and nitrogen has been carried out over a wide range of pressures and subcooling. Empirical correlations are obtained to calculate heat transfer coefficients at nucleate boiling, film boiling and single-phase convection. Conditions are determined for transitions from one heat transfer mode to another. (6 refs.)

61376 A solution for dispersed flow heat transfer using equilibrium fluid conditions. G.L.Yoder, Jr., W.M.Rohsenow (MIT, Cambridge, MA, USA).

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.10-17 (Feb. 1983). A method for predicting steady state dispersed vertical upflow film boiling heat transfer under constant heat flux conditions is presented. Differential transport equations and accepted heat transfer correlations are used to form a solution dependent upon knowledge of conditions at the dryout point only. Thermal nonequilibrium is included in the analysis and the actual flow quality is determined from local equilibrium conditions. A nondimensional grouping is derived which indicates the extent of nonequilibrium present in the flow. Results of this analysis are compared to data of three fluids in tube geometry: Freon 12, nitrogen, and steam. Predictions compare favorably with data from all three fluids. (22 refs.)

61377 Approximate phase change solutions for insulated buried cylinders. V.J.Lunardini (US Army Cold Regions Res. & Engng. Lab., Hanover, NH, USA).

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.25-32 (Feb. 1983). The conduction problem for cylinders embedded in a medium with variable thermal properties cannot be solved exactly if phase change occurs. New approximate solutions have been found using the quasi-steady method. These solutions consider heat flow from the entire pipe surface, rather than from a single point, as has been assumed in the past. The temperature field, phase change location, and pipe surface heat transfer can be evaluated using graphs presented for parametric ranges of temperature, thermal properties, burial depth, and insulation thickness. The theoretical results show good agreement with complete numerical solutions. The accuracy of the method increases as the Stefan number decreases and the results are of particular value for insulated hot pipes or refrigerated gas lines. (14 refs.)

61378 Radiation-natural convection interactions in two-dimensional complex enclosures. L.C.Chang, K.T.Yang, J.R.Lloyd (Dept. of Aerospace, Univ. of Notre Dame, Notre Dame, IN, USA).

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.89-95 (Feb. 1983). A numerical finite-difference study has been carried out for the two-dimensional radiation-natural convection interaction phenomena in square enclosures with equal vertical finite-thickness partitions located at the centers of the ceiling and floor. Both participating gases (CO_2 and NH_3) and nonparticipating gas (air) are considered. In the radiation calculations, the nongray exponential wide-band models for CO_2 and NH_3 are used, together with a radial flux method utilizing a more realistic polar description for the radiation exchange in the enclosure. Results on the effects of both surface and gas radiation on the velocity and temperature fields and the overall heat transfer rates as functions of the partition heights at two levels of the Grashof number are presented and discussed in terms of the physical phenomena. (13 refs.)

61379 An experimental study of free convection heat transfer from a horizontal cylinder in a vertical array set in free space between parallel walls. I.Tokura, H.Saito, K.Kishinami, K.Muramoto (Dept. Industrial Mech. Engng., Muroran Inst. of Technol., Muroran, Japan).

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.102-7 (Feb. 1983). Empirical formulas are proposed from experiments on free convective heat transfer from a cylinder array arranged in a vertical line. Subsequently, experiments were carried out to examine the effect of two parallel plates enclosing the array as a heat transfer promoter. Finally, through a discussion of the heat transfer from the entire cylinder systems, both in open and in restricted spaces, a recommendation is made for designing a heat exchanger of a single-line type of cylinder bank. (8 refs.)

61380 Natural convection heat transfer between eccentric horizontal cylinders. J.Prusa (Dept. of Mech. & Industrial Engng., Univ. of Illinois, Urbana, IL, USA), L.S.Yao.

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.108-16 (Feb. 1983). Laminar natural convection flow between vertically eccentric horizontal cylinders is studied numerically. The inner and outer cylinders are heated and cooled, respectively, to maintain constant surface temperatures. A physical model is introduced which accounts for the effects of fluid buoyancy as well as the eccentricity of the outer cylinder. A radial transformation is used to map the eccentric outer boundary into a concentric circle. Both field of a fluid between horizontal cylinders. The effect of buoyancy, which enhances average heat transfer, increases with the Grashof number. Eccentricity influences the flow in two ways. First, by decreasing the distance between the two cylinders over part of their surfaces, it increases the local heat transfer due to conduction. Secondly the eccentricity influences the convective mode of heat transfer. Results show that moderate positive values of eccentricity, enhance convective heat transfer. Results for a range of Grashof number are given, for varying eccentricity, for a radius ratio of 2.6 and a Prandtl number of 0.706. (24 refs.)

61381 Natural convection at the interface between a vertical porous layer and an open space. A.Bejan, R.Anderson (Dept. of Mech. Engng., Univ. of Colorado, Boulder, CO, USA).

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.124-9 (Feb. 1983). This paper examines the interaction by natural convection between a fluid-saturated porous medium and a fluid reservoir separated by a vertical impermeable partition. The two fluid systems are maintained at different temperatures. The analysis is simplified by assuming $\text{Pr} \gg 1$ in the fluid reservoir. It is shown analytically that the flow and temperature fields in the boundary layer regime consist of two fluid layers in counterflow. The interface temperatures is shown to increase monotonically with altitude. The important dimensionless group which governs the fluid mechanics is $B = (kR_{AK})^{1/2} / (k'R_A)^{1/4}$, where k, k', R_{AK} and R_A are, respectively, the porous medium conductivity, reservoir fluid conductivity, Darcy-modified Rayleigh number based on partition height, and the reservoir Rayleigh number based on partition height. The effect of parameter, B , on the flow, temperature, and heat transfer is documented in the range $0 < B < \infty$. (14 refs.)

61382 A correlation theory for steady natural convective heat transport in horizontal annuli. R.D.Boyd (Sandia Nat. Labs., Albuquerque, NM, USA).

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.144-50 (Feb. 1983). A correlation theory for two-dimensional natural convective heat transport data for horizontal annuli of arbitrary cross section has been developed and applied to two configurations: (i) concentric circular cylinders and (ii) annular formed by an inner hexagonal cylinder and an outer circular cylinder. Also embodied in the theory is the capability to predict local as well as mean heat transfer. Thermal boundary conditions of the form T^*x^m can be accommodated. Data for the Rayleigh number (R_{AK}) varied from 10 to 10^7 , Prandtl number (Pr) varied from 0.7 to 3100, and the aspect ratio (Δ/r), maximum annulus gap/minimum radius of inner annulus varied from 0.5 to 2.0. Even with these large variations, the present correlation theory collapses all the experimental data for the annular geometries to a single line. The physical problem appears to be completely specified by a single equation when the following is known: thermal boundary condition (i.e., m), the fluid (i.e., Pr), the aspect ratio, the Rayleigh number, and the geometry. This work demonstrates that the present theory is applicable to annuli of arbitrary cross section, and therefore the theory will be extended to include curvature effects and axisymmetric geometry. 61383 Heat transfer from interrupted plates. R.L.Zelenka (Bur. of Reclamation, Denver, CO, USA), R.L.Loehrk.

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.172-7 (Feb. 1983). The forced convection heat transfer from two plates aligned with the flow direction in a wind tunnel was measured. The effects of leading edge bluntness, plate spacing distance, and Reynolds number on the leading and trailing plate average heat transfer rate were studied. The low Reynolds number steady laminar and transitional flow regimes investigated are typical for compact heat exchangers. The measured heat transfer rate from the leading plate agrees well with laminar theory for thin plates when the leading edge is rounded. The heat transfer rate from the leading plate with a blunt nose ranges from slightly below theoretical at a Reynolds number which gives a long, steady separation bubble to well above theoretical under conditions of laminar separation and turbulent reattachment. The heat transfer rate from the second plate is influenced by the leading edge configuration of the first plate only at small plate spacing distances and high Reynolds number. At large spacings the mixing provided by the unsteady wake of the first plate dominates that due to the turbulence formed by leading edge separation on the first plate. The leading edge configuration of the second plate is important only at large values of plate spacing. The heat transfer rate from the second plate is generally higher than that predicted by theory for laminar, steady flow over thin plates and may be higher than that on the leading plate. (18 refs.)

61384 Effective thermal conductivity of metal hydride beds. S.Suda, Y.Komazaki, N.Kobayashi (Dept. of Chem. Engng., Kogakuin Univ., Tokyo, Japan).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.317-24 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Tobu, Japan, 30 May-4 June 1982).

An experimental investigation aimed at improving the effective thermal conductivity of activated metal hydride is reported. Of the many material configurations which have been used to enhance heat transmission through metal hydride beds, a three-dimensional structure of a porous aluminium composite has shown the best results giving transmissions a factor of 9 or 10 greater than those of the unmodified hydride bed. The experimental results were used to derive equations for estimating the effective thermal conductivity as a function of the system pressure, the temperature, the hydride composition and the void fraction of the materials used. (3 refs.)

61385 Heat transmission analysis of metal hydride beds. S.Suda, N.Kobayashi, E.Morishita, N.Takemoto (Dept. of Chem. Engng., Kogakuin Univ., Tokyo, Japan).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.325-32 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Tobu, Japan, 30 May-4 June 1982).

Heat transmission studies were performed using a test unit designed to evaluate temperature profiles generated during hydriding and dehydriding reactions in a single metal hydride bed. By solving differential heat balance equations it is possible to predict temperature profiles, hydrogen gas transfer and temperature changes in heat transfer fluids. The computed results are in good agreement with the experimental data. The maximum error in the computed bed temperature was 4°C and the hydrogen flow rates were estimated with a maximum error of 15%. (3 refs.)

61386 An examination into the validity of various prediction methods for void fraction in boiling flow. S. Esaki, K. Sekoguchi, O. Tanaka. *Technol. Rep. Kyushu Univ. (Japan)*, vol.55, no.4, p.357-64 (Aug. 1982). In Japanese. [received: Feb. 1983]

A number of methods have been proposed for predicting the void fraction of boiling flow in the subcooled and saturated regions. The present study examines the validity of these methods by comparing the predicted void fractions with the experimental data available in the literature, including the authors' data. The data points used amount 1685 obtained from 162 test runs covering the experimental ranges: pressure of 1.0–140.6 atm, heat flux of $(1.6\text{--}326)\times 10^4$ kcal/m²h, and mass velocity of 310–5097 kg/m²s. Critical reviews are made as to the suitability and accuracy of individual methods. (21 refs.)

61387 Interaction of the nucleation phenomena at adjacent sites in nucleate boiling. M. Sultan (Westinghouse Canada Ltd., Hamilton, Ontario, Canada), R. L. Judd.

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.3-9 (Feb. 1983). The present investigation is an original study in nucleate pool boiling heat transfer combining theory and experiment in which water boiling at atmospheric pressure on a single copper surface at two different levels of heat and different levels of subcooling was studied. Cross spectral analysis of the signals generated by the emission of bubbles at adjacent nucleation sites was used to determine the relationship of the time elapsed between the start of bubble growth at the two neighbouring active sites with the distance separating them. The experimental results obtained indicated that for the lower level of heat flux at three different levels of subcooling, the elapsed time and distance were directly related. Theoretical predictions of a temperature disturbance propagating through the heating surface in the radial direction gave good agreement with the experimental findings, suggesting that this is the mechanism responsible for the activation of the surrounding nucleation sites. 44.40 RADIATIVE HEAT TRANSFER

61388 Asymptotic analysis of radiative transfer problems. E. W. Larsen (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA), G. C. Pomraning, V. C. Badham.

J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.4, p.285-310 (April 1983).

The equations of radiative transfer are systematically analyzed by asymptotic methods. To lowest order, the classical equilibrium diffusion approximation is recovered. The next order analysis leads to the equilibrium diffusion differential equations and initial condition, but with a boundary condition containing a linear extrapolation distance α . This quantity is related to the solution of a canonical halfspace problem and is computed by deriving an appropriate variational principle. For the case of no scattering, an exact Wiener-Hopf solution is available. The F_N solution technique is also applied to the problem of obtaining α with good results. Higher order asymptotic radiative transfer descriptions are discussed and, while not immediately constituting practical calculational techniques, do have implications for computing the parameters in the multiband treatment of the frequency variable. (35 refs.)

61389 The nonequilibrium Marshak wave problem: a transport theory solution. B. D. Ganapol (Dept. of Nuclear & Energy Engng., Univ. of Arizona, Tucson, AZ, USA), G. C. Pomraning.

J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.4, p.311-20 (April 1983).

An analytic solution to a particular Marshak problem is given. The radiative transfer model used is the one-group grey transport description coupled with the material energy balance. This solution provides a benchmark for validating time-dependent radiative transfer algorithms and constitutes a transport solution to the same problem previously solved using diffusion and low-order P_N approximations. Typical numerical results are given for surface and integral quantities and comparisons are made with the previously reported diffusion solution, as well as with a Monte Carlo result. (10 refs.)

61390 A multidimensional differential approximation for absorbing/emitting and anisotropically scattering media with collimated irradiation. M. F. Modest, S. Tabanfar (Dept. of Mech. Engng., Univ. of Southern California, Los Angeles, CA, USA).

J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.4, p.339-51 (April 1983).

By considering the intensity within a medium to consist of a collimated and a fairly diffuse part, the overall problem of radiative transfer is reduced to two simpler ones: first the collimated intensity is obtained (equivalent in complexity to a nonscattering medium); for the evaluation of the diffuse part of the radiation (due to emission and scattering), a new differential approximation has been developed. To demonstrate the accuracy and simplicity of the present method, two sample cases are presented for which some exact solutions can be found in the literature: results are presented (i) for cosine-varying irradiation incident upon a two-dimensional, isotropically scattering slab and (ii) for irradiation with a Gaussian intensity distribution of a two-dimensional, anisotropically scattering semiinfinite cylindrical medium. (17 refs.)

61391 Radiative heat transfer in fibrous insulations. I. Analytical study. T. W. Tong (Dept. of Mech. Engng., Univ. of Kentucky, Lexington, KY, USA), C. L. Tien.

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.70-5 (Feb. 1983).

The purpose of this work is to develop models for predicting the radiant heat flux in lightweight fibrous insulations (LWFI). The radiative transport process is modeled by the two-flux solution and the linear anisotropic scattering solution of the equation of transfer. The radiative properties of LWFI consistent with these solutions have been determined based on extinction of electromagnetic radiation by the fibres. Their dependence on the physical characteristics of fibrous insulations has been investigated. It has been found that the radiant heat flux can be minimized by making the mean radius of the fibers close to that which yields the maximum extinction coefficient. The results obtained are useful to those concerned with the design and application of LWFI. (14 refs.)

61392 Radiative heat transfer in fibrous insulations. II. Experimental study. T. W. Tong (Dept. of Mech. Engng., Univ. of Kentucky, Lexington, KY, USA), Q. S. Yang, C. L. Tien.

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.76-81 (Feb. 1983).

For pt. I see *ibid.*, vol.105, p.76 (1983). Two experiments have been conducted to study radiative heat transfer in light-weight fibrous insulations (LWFI).

The spectral extinction coefficients for a commercial LWFI have been measured via transmission measurements, and a guarded hot plate apparatus has been used to measure the radiant heat flux as well as the total heat flux in the insulation. The experimental results are compared with the theoretical values calculated according to the analytical models presented in pt. I of this paper. The comparisons reveal that the analytical models are useful in giving representative values for the radiative properties of typical LWFI. However, only qualitative agreements have been obtained for the heat transfer results. (10 refs.)

61393 Radiation and smoke from the gas turbine combustor using heavy fuels. Y. S. H. Najjar (Mech. Engng. Dept., Yarmouk Univ., Irbid, Jordan), E. M. Goodger.

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.82-8 (Feb. 1983). Broadening of aviation fuel specifications has been simulated using blends of gas oil and residual fuel oil. Radiation, smoke, and temperature measurements in an experimental combustor at various air pressure, inlet temperature, and air/fuel ratios showed a diminishing rate of increase of radiation with soot concentration and reduced sensitivity of smoke to fuel hydrogen content at higher combustor pressures. (6 refs.)

61394 The insulation effectiveness of a porous material as measured by the screening technique. C. R. Maiti (Cryogenic Engng. Centre, Indian Inst. of Technol., Kharagpur, India).

Cryogenics (GB), vol.23, no.4, p.207-8 (April 1983). The percentage transmittance of infrared radiant energy through porous material at room temperature has been reported. It can be utilised to compare the insulation effectiveness under high vacuum. (2 refs.)

61395 Thermal radiation effects in thermal conductivity measurements: analysis and remedies. M. Locatelli, J. Lopez, M. Nunez-Regueiro (Lab. de Cryophys., CENG, Grenoble, France).

J. Phys. D (GB), vol.16, no.4, p.479-87 (14 April 1983).

The authors have studied the effect of thermal radiation on measurements of the thermal conductivity of small samples below room temperature. By using the different thermal conductivity technique they were able to measure the importance of these effects for temperatures greater than about 100K and to determine the principal source of error of the double flux correction, i.e. the different heater temperature with each different heat flux. They thus propose a better configuration for performing such measurements. (2 refs.)

(see also 05.70 Thermodynamics, 07.20 Thermal instruments and techniques)

61396 On the problem of evolution criterion for thermodynamical waves. D. K. Bhattacharya (Tech. Univ. of Budapest, Budapest, Hungary).

Acta Mech. (Austria), vol.47, no.1-2, p.87-94 (1983).

Irreversible systems in which both dissipative and relaxation phenomena are taking place can be appropriately described by the wave approach of Onsagerian thermodynamics proposed by Gyarmati. An important consequence of this theory is that it leads to hyperbolic transfer equations and these are referred to as thermodynamical waves. The author examines the possibility of existence of an evolution criterion for such thermodynamical waves. A monotonic transition of the thermodynamical waves from non-equilibrium states to stationary states is insured only when dissipative processes are dominant over relaxation phenomena. (22 refs.)

61397 A hybrid computer algorithm for temperature distribution analysis of irregular two dimensional shapes. P. Valisalo (Dept. of Industrial & Systems Engng., Univ. of Florida, Gainesville, FL, USA), D. Bergquist, V. McGrew.

10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.17-19 vol.2

The principle of random walk was used to determine the temperature at a given point on a two dimensional plate, using a Monte Carlo method for solving linear partial differential equation. To determine the number of walks required the relationship between the grid size (i.e. the distance from one point to the next one) and the standard deviation of the random noise driving the x- and y-axis on an x-y plotter, a simple square plate was used. Three of the sides were subjected to a certain temperature on the contour line, C, and one to a different temperature. Because an analytical solution for this problem is readily available, this test was used for comparison purposes. A methodology was developed whereby a two dimensional plate of any shape subjected to a number of different temperatures along a contour line could be analysed. The methodology is described. A recommendation is made on how to expand this to three dimensions and how to improve it if more sophisticated equipment is available. (3 refs.)

61401 Numerical solution of two-dimensional static boundary problems for flexible conical shells. Ya.M.Grigorenko (Acad. of Sci., Ukrainian SSR), N.N.Kryukov, Kh.Saparov.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.2, p.28-31 (1983). In Ukrainian.

Presents an approach to a numerical solution of a two-dimensional nonlinear boundary problem concerning the geometrically nonlinear deformation of conical shells of variable thickness. The two-dimensional boundary problem is reduced to a one dimensional problem by means of a difference approximation along a circular coordinate. This latter problem is solved by the method of linearization. The calculation results illustrate the process of convergence. (9 refs.)

61402 Analysis of shells with Monge's middle surfaces by a semianalytical finite element method. Ya.G.Savula.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.2, p.37-40 (1983). In Ukrainian.

Presents an analysis of shells with Monge's middle surfaces. The analysis is carried out using a semianalytical finite element method. Numerical results are obtained for two classes of shells: curved tubes and zero Gauss curvature shells. The error bound for the semianalytical method is established. (8 refs.)

61403 On the Lagrangian formulation of continuum mechanics. A.Golebiewska-Herrmann (Div. of Appl. Mech., Stanford Univ., Stanford, CA, USA).

Physica A (Netherlands), vol.118A, no.1-3, p.300-14 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

The aim of the paper is to show that a Lagrangian formulation of continuum mechanics (in the spirit of field theory) can deliver not only equations of motion but the conservation laws related to the material symmetries in the perfect continuum. Those conservation laws in the presence of defects lead to the path-independent integrals broadly used in fracture mechanics. They are basically related to the (material) forces on a defect in a continuum and can be interpreted as the equations of motion for a defect with respect to the material. The quantity playing the role of the stress tensor in this formulation is the material momentum tensor. A simple example of a material force in the form of a path-independent integral in the fluid is considered. (13 refs.)

61404 A St. Venant principle for nonlinear elasticity. R.J.Knops (Heriot-Watt Univ., Edinburgh, Scotland), L.E.Payne.

Arch. Ration. Mech. & Anal. (Germany), vol.81, no.1, p.1-12 (1983).

The authors consider a semi-infinite cylinder made from homogeneous nonlinear elastic material and loaded on its base by a self-equilibrated distribution of forces. The lateral sides are stress-free, but it is not assumed a priori that the stresses and displacement vanish at infinity. They prescribe that their absolute values do not grow faster than a given exponential. Under certain constitutive hypotheses, it is then possible to prove that the L_2 -integral of the displacement taken over a cross-section of the cylinder either grows faster than some exponential or decays at least exponentially with distance from the base of the cylinder. A similar result is proved when the displacement is held fixed on the lateral sides, but then it is found that the force distribution over the base need not necessarily be self-equilibrated. (24 refs.)

61405 St. Venant formulae for generalized St. Venant problems. P.Podio-Guidugli (Univ. de Pisa, Pisa, Italy).

Arch. Ration. Mech. & Anal. (Germany), vol.81, no.1, p.13-20 (1983).

For an isotropic, linearly elastic cylinder subject to end tractions equipollent to a torque M , the 'twist' τ is defined in such a way that $M = (\mu R)\tau$, where

μR , the torsional rigidity of the cylinder, is resolved into the factors μ , the shear modulus, and R , a geometric quantity depending only on the cross-section. As remarked by Truesdell (*Appl. Mech. Reviews* vol.12, p.75 (1959)) and recalled by Day (*ibid.*, vol.76, p.283 (1981)), such a twist would generalize St. Venant's motion of twist so as to apply also to solutions of the torsion problem corresponding to distributions of end tractions different from one assumed by St. Venant. The author investigates whether, were Truesdell's problem rephrased in the obvious manner, Day's procedure would apply to further generalized St. Venant problems. (7 refs.)

61406 A coupled thermoelastic problem of an infinitely extended thin plate containing a circular hole with thermal relaxation. N.Bhatta, S.K.Roy Choudhuri (Dept. of Maths., Burdwan Univ., Burdwan, India).

Indian J. Pure & Appl. Math., vol.14, no.1, p.85-95 (Jan. 1983).

Generalised dynamical theories of thermoelasticity are employed to study a two dimensional thermoelastic problem of an infinitely extended thin plate containing a circular hole whose free inner boundary is subjected to a step rise in temperature. Short time-approximation for stresses are derived using the Laplace transform technique. (6 refs.)

61407 Influence of the coupling effect on a transient thermoelastic problem in a solid sphere. Y.Takeuti, Y.Tanigawa (Dept. of Mech. Engng., Univ. of Osaka Prefecture, Sakai, Japan).

J. Tech. Phys. (Poland), vol.22, no.4, p.463-75 (1981).

The authors consider the coupled problems of a spherical region. Using a new technique, they succeed in separating the analysis of the temperature field and the associated stress fields. For the illustrative purposes they have obtained the coupled solution for a solid sphere, due to axisymmetrical local heating, without any approximations, which is effective enough for the whole time range. They have also carried out numerical calculations using the most realistic value of the coupling parameter. From the numerical results it can be seen that the effect of the thermoelastic coupling term shows a clear lag in the temperature and the stress distributions in comparison with the uncoupled results. (1 ref.)

61408 Non-linear optimization of the material constants in Ogden's stress-deformation function for incompressible isotropic elastic materials. E.H.Twizell, R.W.Ogden (Dept. of Math., Brunel Univ., Uxbridge, England).

J. Aust. Math. Soc. Ser. B (Australia), vol.24, pt.4, p.424-34 (April 1983).

The present paper improves upon established correlation between theory and experiment by a systematic optimization procedure for calculating material constants. For purposes of illustration the Levenberg-Marquardt non-linear least squares optimization algorithm is adapted to determine the material constants in Ogden's three-term stress-deformation function. Calculations are carried out also in respect of a four-term stress-deformation function and further improvement in the fit is achieved over a large range of deformation. (10 refs.)

61409 Bending of a plate with a periodic system of cuts. V.A.Merkulov. *Mech. Solids (USA)*, vol.17, no.4, p.171-6 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.4, p.187-92 (1982).

On the basis of the method previously proposed for the two-dimensional problems, the author obtains the integral equations of the problem of elasticity for bending of a thin plate with a periodic system of through curvilinear cuts loaded by systems of forces and moments that are self-equilibrated on each cut. It is established that the equation is solvable, and that a solution of the initial boundary-value problem exists and is unique. The problem is solved in quadratures for cuts along one straight line. When only the principal vector is equal to zero on each cut, for cuts along one line, the problem can also be solved in quadrature by the method of linear conjunction of the boundary values. For the case of one cut in a period, the stress intensity coefficients are obtained upon bending of the plate by moments applied both to the edges of the cut and at infinity. (7 refs.)

61410 Finite anti-plane shear of a semi-infinite strip subject to a self-equilibrated end traction. C.O.Horgan, R.Abeyaratne (Michigan State Univ., East Lansing, MI, USA).

Q. Appl. Math. (USA), vol.40, no.4, p.407-17 (Jan. 1983).

In a recent paper (see C.O. Horgan, H.K. Knowles, *J. Elasticity*, vol.11, p.271-91, 1981), a version of Saint-Venant's principle was formulated and established for finite elastostatics. The present authors refer to the previous work and the references cited therein for a discussion of the issues underlying Saint-Venant's principle both for linear and nonlinear elasticity. The semi-infinite strip problem is considered for the special case of self-equilibrated applied end traction ($\tau=0$). An exponential decay inequality for the nonvanishing component of shear stress on the long sides of the strip is established. This result is qualitatively similar to that previously obtained but provides a sharper estimate. (7 refs.)

61411 Thermal stresses in anisotropic noncylindrical beams. S.Chirita (Univ. of Iasi, Iasi, Rumania).

Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.1, p.63-74 (Jan.-Feb. 1983).

The deformation of some noncylindrical beams under the action of a temperature variation, of polynomial form in the axial coordinate, is studied. The case of the almost cylindrical beams, the naturally twisted beams and the naturally slightly curved beams made of an anisotropic and inhomogeneous elastic material are considered. The thermoelastic coefficients are independent of the axial coordinate. (12 refs.)

61412 Large deflection finite element analysis of elastic beams under a follower force. N.Uda, K.Kunoo, H.Ohira.

Technol. Rep. Kyushu Univ. (Japan), vol.55, no.4, p.365-70 (Aug. 1982). In Japanese. [received: Feb. 1983]

Presents a nonlinear analysis of elastic beams subjected to a follower force by a finite element method. The special effect of follower forces which are dependent on displacement is formulated as a load stiffness matrix. The large deflection behavior of elastic systems under a follower force is analysed statically by the finite element method using the incremental technique. The critical load for divergence or flutter is obtained by applying the dynamic criterion at each step of the load increment. The use of the present method is demonstrated on several assemblies of the beam element. (9 refs.)

61413 A theory of viscoelastic composites modeled as interpenetrating solid continua with memory. M.F.McCarthy (Nat. Univ. of Ireland, Galway, Ireland), H.F.Tiersten.

Arch. Ration. Mech. & Anal. (Germany), vol.81, no.1, p.21-51 (1983).
 An existing description of composite materials modeled as interpenetrating solid continua is extended to include constitutive response functionals over the histories of the constitutive variables of the n -consistent composite. As in the earlier work, the relative displacement of the individual constituents is required to be infinitesimal in order that the composite does not rupture even though the motion of the combined composite is finite. Conditions on the response functionals under the assumption of fading memory are obtained from the Clausius-Duhem inequality for the combined composite. Relaxation and cyclical processes are discussed and it is shown that the equilibrium response of the composite considered is the same as that of the elastic composites treated in the earlier work. Some detailed results are obtained for the case of two-constituents under the additional assumption of finite linear viscoelastic response. (36 refs.)

61414 Viscoplastic localization in simple shear: exact results in nonlinear theory. A.Molinari (Univ. de Metz, Metz, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.1, p.1-4 (10 Jan. 1983). In French.

Examines the onset and evolution of shear bands occurring in a simple shear deformation initially quasi-homogeneous. The material is viscoplastic and thermomechanical coupling is accounted for. The problem is assumed quasi-static and adiabatic. The localization process is described for temperature and deformation with respect to different constitutive laws, specially for strain hardening materials and Arrhenius laws. (5 refs.)

61415 A generalization of plastic zone representations under antiplane strain of ideally elastic plastic solids with a pointed stress concentrator. V.A.Kriven'.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.2, p.31-4 (1983). In Ukrainian.

Deals with the solution of elasto-plastic problems of a longitudinal shear of nonhardenable solids with a wedge-like notch, using the supposition that the plastic zone is formed by a bunch of plastic stripes coming out from the corner point of the notch. It is shown that discontinuous solutions describing such plasticity zones under conditions of an infinite increase in stripe number turn into continuous solutions describing plastic strains distributed in a certain three-dimensional region. (6 refs.)

61416 Elasto-plastic analysis of anisotropic plates and shells by the semi-loof element. D.R.J.Owen (Dept. of Civil Engng., Univ. of Wales, Swansea, Wales), J.A.Figueiras.

Int. J. Numer. Methods Eng. (GB), vol.19, no.4, p.521-39 (April 1983).
 An elasto-plastic analysis of thin plates and shells by means of the finite element displacement method is considered for anisotropic materials, using the Semi-loof curved shell element. The elasto-plastic analysis is based on the Huber-Mises yield criterion extended by Hill for anisotropic materials. The yield function is generalized by introducing anisotropic parameters of plasticity which are updated during the material strain hardening history. Numerical examples are presented and compared with available solutions. The effects of anisotropy on these solutions are also discussed. The practical problem of an aerofoil blade is also considered and some results presented. (20 refs.)

61417 Anisotropic elasto-plastic finite element analysis of thick and thin plates and shells. D.R.J.Owen (Dept. of Civil Engng., Univ. of Wales, Swansea, Wales), J.A.Figueiras.

Int. J. Numer. Methods Eng. (GB), vol.19, no.4, p.541-66 (April 1983).
 An elasto-plastic analysis of anisotropic plates and shells is undertaken by means of the finite element displacement method. A thick shell formulation accounting for shear deformation is considered, which is based on a degenerate three-dimensional continuum element. The accommodation of variable material properties, not only along the surface of the structure but also through the thickness, is made possible by a discrete layered approach. Although isoparametric elements of the Serendipity family give satisfactory solutions for thick and moderately thin shells the results exhibit 'locking' for an increasing ratio of span to thickness. To develop a numerical model which is applicable to thick or thin plates and shells, the nine-node Lagrangian element and the Heterosis element are also introduced into the present model. Plastic yielding is based on the Huber-Mises yield surface extended by Hill for anisotropic materials. The yield function is generalized by introducing anisotropic parameters of plasticity which are updated during the material strain hardening history. (35 refs.)

61418 The elasto-plastic problem of a thin rotating disc with variable thickness. J.G.Chakravorty, P.K.Choudhuri (Dept. of Appl. Maths., Univ. Coll. of Sci. & Technol., Calcutta, India).

Indian J. Pure & Appl. Math., vol.14, no.1, p.70-8 (Jan. 1983).
 Investigates the problem of a thin rotating disc with a central circular hole and thickness varying with the radial distance. The problem has been solved in the elasto-plastic range assuming two arbitrary functions for the thickness of the disc. The angular velocity for which the disc becomes completely plastic has been computed numerically for both cases and has been compared with its value when the disc is uniform in thickness. (9 refs.)

61419 Creep of structural elements with random parameters. V.N.Ilin, V.V.Kashelkin, S.A.Shestarikov.

Mech. Solids (USA), vol.17, no.4, p.145-51 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.4, p.159-67 (1982).
 A probabilistic and statistical approach is proposed to creep calculations for mechanical elements of structures such as rods, plates, and shells. It is assumed that the mathematical model of deformation of the elements in question has been reduced to a Cauchy problem for ordinary differential equations containing a finite number of random parameters $a_j (j=1, \dots, k)$ with known joint probability distribution density $p_k(a_1, \dots, a_k)$. Under the assumption that the scatter $a_j (j=1, \dots, k)$ is statistically small, a solution of the fundamental problem of statistical structural dynamics is offered in relation to creep of these elements. The small-parameter method and approximate canonical expansions of the unknown random functions are employed.

61420 Bending of a plate containing coated pores. A.I.Plotnikov, Yu.A.Fedorov, A.M.Chernikov.

Mech. Solids (USA), vol.17, no.4, p.177-82 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.4, p.193-9 (1982).
 Porous materials exist in which a layer of material different from the matrix forms on the pore surface. This layer can create internal stresses, thus exerting considerable influence on the physical and mechanical properties of the material. If the coated pores are in a fairly thin plate, then the internal stresses may be the cause of bending of the plate. The authors calculate the bending of a circular plate resulting from stresses of this type. (5 refs.)

61421 When is a nonlinear viscoelastic material hyperelastic. D.W.Reynolds (Univ. Coll. Dublin, Dublin, Ireland).

Q. Appl. Math. (USA), vol.40, no.4, p.492-6 (Jan. 1983).
 Presents two different characterizations, in terms of work, of hyperelastic materials within the wider class of nonlinear viscoelastic ones. A viscoelastic material is regarded as one in which the stress depends continuously on strain history and has a mild form of fading memory. If the stress equals the gradient of potential evaluated at the present strain, the material is hyperelastic. In such a material, the stress depends on the strain history only through its present value. (8 refs.)

61422 A matrix method for the study of the stress and deformation of continuous beams, statically non-determined, subjected to bending. D.Voiculescu, D.Mateescu (Inst. Polytech., Bucharest, Rumania).

Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.27, no.5, p.629-50 (Sept.-Oct. 1982). In French. [received: March 1983]

Presents a study of continuous beams, statically non-determined, subjected to continuous or distributed loads and shows discontinuities in the shape or the displacement. A matrix method is described in order to determine the deformation-stress vector on a portion of the beam situated between two consecutive supports. The application of this method to a continuous beam on several supports leads to a system of equations on a Jacobi type of matrix, which is resolved by the decomposition of each matrix into a product of biological matrices. This method may be applied whatever the conditions at the extremities of the continuous beam. (6 refs.) H.C.B.

61423 Antiplane deformation of a body with a curved elastic sharp-ended inclusion. L.T.Berezhnitskii, P.S.Kachur, L.P.Mazurak, Ya.I.Khodan' (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.3, p.245-50 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.63-9 (May-June 1982). [received: Feb. 1983]

An algorithm is proposed for calculating the stress intensity factors close to the tip (the cusp on the contour) of a foreign inclusion in an isotropic body in antiplane deformation. On the basis of the method of 'disturbance of the form of the boundary' recurrent equations were obtained for the coefficients of expansion of the complex functions of stresses. A determination is given of the convergence of the stress intensity factors, and the relationship of these values to the configuration of the inclusion and to the difference between the elastic characteristics of the materials of the composite is investigated. (5 refs.)

61424 Numerical solutions for analyzing the nonaxisymmetric 2-dimensional deformation processes. S.Nishimura (Dept. of Precision Engng., Tohoku Univ., Sendai, Japan).

Technol. Rep. Tohoku Univ. (Japan), vol.47, no.2, p.189-201 (1982). In English.

A method for analyzing non-axisymmetric 2-dimensional deformation processes is presented. In the state of non-axisymmetric plane stress, incremental strains are not integrable with respect to time, since the principal axes of the incremental strains are rotated with respect to the material element. The fundamental equations are more complicated than those in the axisymmetric case because two position variables are necessary and one-to-one correspondence between differential representations of the displacements and strains is not satisfied due to shearing strains. In the present method, avoiding these difficulties, only stresses and displacements are used as dependent variables, so that the compatibility equations do not come into the analysis explicitly. The difference method may be, then, easily adopted for the numerical solutions. The present method is considered to be useful in the problems which are investigated by means of the flow theory for work-hardening materials. (6 refs.)

61425 Optimal laminated composite shells for buckling and vibration. Y.S.Nshanian (Ministry of Agriculture, Yerevan, USSR), M.Pappas.

AIAA J. (USA), vol.21, no.3, p.430-7 (March 1983).
 Methods are proposed for the determination of the optimal ply angle variation through the thickness of symmetric angle-ply shells of uniform thickness. These methods use continuous piecewise-linear segment approximations or discontinuous piecewise-constant segment approximations to the ply angle function. A mathematical programming (MP) problem is formulated using segment ply angles and thicknesses as design variables. A special MP algorithm, capable of treating multiple objective functions, combined with a critical mode search is used to solve this problem. The procedure is applied to the maximization of the minimum natural frequency or buckling load of a thin, simply supported, circular, cylindrical, angle-ply shell. Results show large performance gains result from the use of optimal variable ply angle configurations, compared to an optimal constant ply angle. The continuously variable ply angle approximation is particularly effective. (15 refs.)

61426 Dynamic stability boundaries for a sinusoidal shallow arch under pulse loads. M.T.Donaldson, R.H.Plaut (Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).

AIAA J. (USA), vol.21, no.3, p.469-71 (March 1983).

The dynamic snap-through of shallow elastic arch subjected to triangular pulse loads is investigated. Concentrated loads with independent magnitudes are applied at the quarter points of the arch as a means of assessing the effects of load asymmetry. Critical load combinations are determined and the effects of the pulse duration and external damping on the interaction curves are examined. The behaviour is similar to that of some shallow shells under blast loads and demonstrates that asymmetric loading may have much lower critical values than symmetric loading. (10 refs.)

61427 Use of the Southwell method to predict buckling strengths of stringer stiffened cylindrical shells. C.G.Foster (Dept. of Civil & Mech. Engng., Univ. of Tasmania, Hobart, Tasmania, Australia), R.C.Tennyson. *Strain (GB)*, vol.19, no.2, p.63-7 (May 1983).

Presents the results of some tests that were conducted on stringer stiffened epoxy cylindrical shells. The object of the investigation was to determine if the Southwell technique for estimating buckling loads could reasonably be used for the nonlinear collapse of cylindrical shells. The results showed that the technique provides a useful estimate of the buckling load provided care is taken in interpreting the results. In some instances the estimate is likely to be greater than the actual load. Where two buckling modes are encountered at the same time the Southwell technique appears to predict the critical load associated with either mode depending on the deflection parameter being measured as well as on the interpretation of the results. (3 refs.)

61428 On lateral buckling—fracture stability of thin-sheet structural components with deep cracks. H.-P.Rossmann (Inst. für Mech., Tech. Univ. Wien, Wien, Austria).

Z. Flugwiss. & Weltraumforsch. (Germany), vol.7, no.1, p.29-33 (Jan.-Feb. 1983). In German.

Fracture mechanics and stability aspects of combined cracking, lateral buckling and small scale yielding phenomena are investigated for particular thin-walled structural components fabricated of brittle or semi-ductile materials. (8 refs.)

61429 On the Liapounov-Movchan stability of equilibrium of elastic orthotropic plates. J.L.Nowinski (Univ. of Delaware, Newark, DE, USA).

Acta Mech. (Austria), vol.47, no.1-2, p.27-38 (1983).

On the basis of the Liapounov definition of stability and the necessary and sufficient Liapounov-Movchan conditions for a continuous body to remain stable, an elastic orthotropic rectangular plate subject to a uniformly distributed inplane compression, is analyzed. Two types of loading are considered: a conservative dead load and a nonconservative follower load. Two metrics discussed involve the maximum and the mean-square values of the deflection. The secondary critical load is found to depend heavily on the kind of anisotropy. (18 refs.)

61430 Dynamic loading of nonlinearly flowing cylindrical and spherical shells. S.B.Maksimov, V.A.Lupin, L.V.Maksiova.

Combust. Explos. & Shock Waves (USA), vol.18, no.4, p.495-8 (July-Aug. 1982). Translation of: *Fiz. Goreniya & Vzryva (USSR)*, vol.18, no.4, p.120-3 (July-Aug. 1982). [received: March 1983]

The utilization of highly intensive dynamic loads in modern engineering, in the explosion of high explosives (HE), say, requires a study of dynamics of behavior of structures and the solution of strength problems. The substantial strain rates originating here often result in the appearance of nonlinearly flowing properties of materials. The inertial expansion of cylindrical and spherical shells in a resisting medium is examined. (10 refs.)

61431 A shell-type structure under the effect of an impulsive load. P.S.Lugovii, V.N.Chaban.

Dopov. Akad. Nauk UKRSR. Ser. A (USSR), no.2, p.34-7 (1983). In Ukrainian.

Studies the dynamics of an axisymmetrical composite shell under the effect of a radial uniformly distributed pulse. (2 refs.)

61432 Coupled vibrations of beams—an exact dynamic element stiffness matrix. P.O.Friberg (Div. of Solid Mech., Chalmers Univ. of Technol., Gothenburg, Sweden).

Int. J. Numer. Methods Eng. (GB), vol.19, no.4, p.479-93 (April 1983).

A uniform linearly elastic beam element with non-coinciding centres of geometry, shear and mass is studied under stationary harmonic end excitation. The Euler-Bernoulli-Saint Venant theory is applied. Thus the effect of warping is not taken into account. The frequency-dependent 12×12 element stiffness matrix is established by use of an exact method. The translational and rotational displacement functions are represented as sums (real) of complex exponential terms where the complex exponents are numerically found. Built-up structures containing beam elements of the described type can be analysed with ease and certainty using existing library subroutines. (39 refs.)

61433 Vibration of a plate of arbitrary shape with free and simply supported mixed edges. K.Nagaya (Dept. of Mech. Engng., Faculty of Engng., Gunma Univ., Gunma, Japan).

J. Acoust. Soc. Am. (USA), vol.73, no.3, p.844-50 (March 1983).

This paper is concerned with a method for solving vibration problems of a plate of arbitrary shape with free and simply supported mixed edges. In the analysis the exact solution of the equation of motion which includes terms representing the reaction forces of the simply supported edges is applied. The boundary conditions along the edges of arbitrary shape have been satisfied directly by making use of the Fourier expansion collocation method which has been developed by the author on vibration, dynamic response, and wave propagation problems of membranes, plates, and rods with arbitrarily shaped boundaries. The equation for finding the eigenfrequencies of plates of arbitrary shape with free and simply supported mixed edges has been obtained. As applications of the present result, numerical calculations have been carried out for polygonal plates, trapezoidal plates, truncated elliptical plates, and parabolic plates with the mixed edges. (15 refs.)

61434 Free vibration of cantilever quadrilateral plates. R.S.Srinivasan, B.J.Babu (Indian Inst. of Technol., Madras, India).

J. Acoust. Soc. Am. (USA), vol.73, no.3, p.851-5 (March 1983).

In this paper, a numerical method for the free vibration analysis of cantilever quadrilateral plates of general shape is presented. Using quadrilateral coordinates and integral equation of beams, the expressions for the strain energy and kinetic energy have been developed. The formulation and derivation of

equations are in the matrix form 'ab initio'. Then the eigenvalue problem is solved for frequencies and mode shapes. Numerical work has been done for particular cases and the results compared with those of other investigators. The effect of sweep back angle has also been studied. (15 refs.)

61435 Horizontally polarized waves in composites and bonds. A.H.Nayfeh (Coll. of Engng., Yarmouk Univ., Irbid, Jordan), E.Abel-Ati, M.Nassar.

J. Sound & Vib. (GB), vol.87, no.3, p.439-47 (8 April 1983).

A simple continuum model is developed in order to investigate the propagation of horizontally polarized waves in laminated composites with bonds. The geometric arrangement of the composite with the bond is treated as a special type of a trilaminated composite in which each of its major constituents is sandwiched between two bonding layers. In this model the details of the propagation process in the bonding material are ignored, but its effects manifest themselves as modifiers to the interface conditions. The exact dispersion relation for the bilaminated composite subjected to the modified interface conditions is also derived. Results of both models are compared with each other and also with the exact dispersion relation obtained for the trilaminated composite. (3 refs.)

61436 Fast convergence modal analysis for continuous systems. A.Y.T.Leung (Dept. of Civil Engng., Univ. of Hong Kong, Hong Kong).

J. Sound & Vib. (GB), vol.87, no.3, p.449-67 (8 April 1983).

A continuous system has an infinite number of degrees of freedom (n.d.o.f.) in a dynamic analysis. The dynamic stiffness method is able to produce an infinite number of natural modes with use of only a finite number of co-ordinates. The associated modal analysis is the only widely applicable approximate method for computing the response without discretizing the continuous system by methods such as the finite element method, in which the infinite n.d.o.f. is not retained. However, this modal analysis converges very slowly as the number of modes is increased if the loading distribution does not follow the patterns of the first few modes. A method is suggested in the paper to accelerate the convergence. A mixed mass matrix is introduced according to the reciprocal theorem to evaluate the initial transient while retaining the infinite n.d.o.f. with a finite number of co-ordinates. Explicit formulae are given for space frames. (6 refs.)

61437 A parametrically driven harmonic analysis of a non-linear stretched string with time-varying length. G.Tagata (Nippon Gakki Co. Ltd., Hamamatsu, Japan).

J. Sound & Vib. (GB), vol.87, no.3, p.493-511 (8 April 1983).

The paper is concerned with the first, second and third harmonic lateral vibrations of a string having a forced, periodic, small length variation. Account is taken of the non-linear term arising from the correction to the tension of the string due to local elongation. It is found that increasing the amplitude of the length variation of the string results in a narrowing of the frequency response range of each of the harmonic oscillation components. Both numerical and analytical calculations of the harmonic frequency responses have been carried out. The relationships for initial values between the original differential equation and the approximate differential equations for the harmonic responses are discussed in detail. (13 refs.)

61438 Comments on 'On the axial vibration of rotating bars'. D.H.Hodges (US Army Res. & Technol. Labs., Ames Res. Center, Moffett Field, CA, USA), C.Vankatesan, V.T.Nagaraj.

J. Sound & Vib. (GB), vol.87, no.3, p.513-18 (8 April 1983).

For original paper see C. Venkatesan and V.T. Nagaraj, *ibid.*, vol.74, p.143-7 (1981). Venkatesan and Nagaraj derived a non-linear equation that governs the axial vibration of a bar normal to and rotating about an inertially-fixed axis. A linearized perturbation solution for the fundamental frequency was obtained that is similar to the result of D.H. Hodges (1977). The authors consider three conclusions of Venkatesan and Nagaraj's paper: (1) that the analysis by Hodges contains an error; (2) that the fundamental frequency of vibration increases as rotor angular speed increases; and (3) that this change in frequency is negligible for typical helicopter blades. A reply by Venkatesan and Nagaraj is also included. (15 refs.)

61439 Natural frequencies of epicycloidal plates. T.Irie, G.Yamada, M.Sonoda (Dept. of Mech. Engng., Hokkaido Univ., Sapporo, Japan).

J. Sound & Vib. (GB), vol.87, no.3, p.519-23 (8 April 1983).

The natural frequencies (the eigenvalues of vibration) are presented for epicycloidal plates. The epicycloidal plates are transformed into circular regions of unit radius by a conformal mapping. Both clamped and simply supported plates are considered. (7 refs.)

61440 Propagation of plastic waves in a bar of material exhibiting strain-rate effect (on the existence of strain plateau). M.Naitoh, M.Daimaru (Muroran Inst. of Technol., Muroran, Japan), W.Kishimoto.

J. Soc. Mater. Sci. Jpn. (Japan), vol.31, no.350, p.1068-72 (Nov. 1982). In Japanese. [received: April 1983]

Deals with a problem of propagation of longitudinal plastic waves in a semi-infinite bar subjected to a constant impact velocity, according to Malvern's strain-rate dependent theory. The authors discuss whether or not Malvern's theory (1951) can account for the plateau of uniform plastic strain adjacent to the impact end of the bar, which is predicted by Karman's theory neglecting a strain-rate effect and is observed experimentally. Malvern could not explain the strain plateau in his own calculations. This is considered so far to be only a weak point in the strain-rate dependent theory, though it can account for the extensive phenomena of high-rate deformation and plastic wave propagation in a bar. The existence of the strain plateau can also be predicted by Malvern's theory. Its appearance requires a relaxation time which is governed by the strain-rate dependence of material and the impact velocity at the end of a bar. As the strain-rate dependence of material and the impact velocity increase, the relaxation time needed for the appearance of the strain plateau increases. (8 refs.)

61441 Elasto-plastic wave propagation in a finite bar with consideration of temperature rise caused by plastic work. H.Date (Faculty of Engng., Tohoku Gakuin Univ., Tagajo, Japan).

J. Soc. Mater. Sci. Jpn. (Japan), vol.31, no.350, p.1073-9 (Nov. 1982). In Japanese. [received: April 1983]

The simulation of an elasto-plastic wave propagation in a finite bar, which impinged on a flat rigid anvil, has been made with a computer by taking the temperature rise into account. A constitutive equation used in the analysis is rate-dependent. The temperature rise has an influence upon the static stress-strain relation without a delay time. The static stress is a linear function of absolute temperature. The problem was formulated and solved numerically by the method of characteristics with a supplemental rectangular net. The numerical results show that temperature rise has the influence upon the deformation resistance of the specimen and unloading wave from free end. Consequently, the specimen length, impact stress, material constant K defined plastic strain rate and initial temperature have considerable influence upon stress, strain and time of contact. (20 refs.)

61442 Exact solution to the formation and propagation problem of a non-stationary shock wave in bilinear media. E.Włodarczyk.
J. Tech. Phys. (Poland), vol.22, no.4, p.391-406 (1981).

An exact solution is presented to the formation and propagation problem of a nonstationary plane shock wave in the medium with a concave (rigid) characteristic $\sigma - \epsilon[\sigma](\epsilon) < 0$, approximated by the bilinear model. The form is explicitly defined of a shock wave in the loading and unloading zone. Exact formulae are derived for the parameters of state and motion of the medium behind the wave front. (24 refs.)

61443 Three-dimensional problem of diffraction of plane elastic waves by a wedge. S.Kh.Sharipova.
Mech. Solids (USA), vol.17, no.4, p.115-22 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.4, p.127-35 (1982).

Using the regular method that was previously developed for dynamic problems of elasticity theory, exact analytic solutions are obtained of three-dimensional nonstationary problems of diffraction of plane longitudinal and transverse waves by a smooth wedge. The author allows for the fact that the desired three-dimensional solutions of problems of plane wave diffraction are obtained from the solutions of the corresponding spherical-wave diffraction problems as the sources become infinitely distant. (13 refs.)

61444 Excitation of waves by a vibrating elastic cylinder in a layer. S.P.Pel'ts, V.L.Tsvetyanski.
Mech. Solids (USA), vol.17, no.4, p.128-32 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.4, p.141-5 (1982).

The axisymmetric problem of forced nonresonant harmonic oscillations of an elastic cylinder on an elastic layer is considered. A solution is constructed for the problem on the basis of the generalized orthogonality relations for the system of dynamic homogeneous solutions of the cylinder. The statement of the problem presupposes that there is a static load that presses the cylinder to the layer and inhibits the formation of separation zones. A solution of the dynamic component of the problem is offered. (11 refs.)

61445 Lamb waves in a prestressed plate of isotropic nonlinear-elastic incompressible material. M.G.Yakovenko.
Mech. Solids (USA), vol.17, no.4, p.133-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.4, p.146-50 (1982).

Investigates the effect of prestresses and of finite deformations on the phase velocity of Lamb wave propagation in a plate (layer) of arbitrary isotropic Cauchy-nonlinear-elastic incompressible material. The basic equations of a previous paper are employed, which dealt with the analogous problem for Rayleigh surface waves. Dispersion equations for antisymmetrical and symmetrical forms are obtained. These equations can be represented as explicit dependences of the initial stresses on the elongations, phase velocity, and wavelength, something that is extremely convenient for investigating the effect of the parameters of the initial stress-strain state on the phase velocity. The relationship to the solution of the problem of instability of such a plate is demonstrated. The author considers the case in which the principal stresses are equal; asymptotic formulas for very long waves are derived; and some numerical results are presented. (4 refs.)

61446 Effect of static stressed state on free vibrations of a shell. N.N.Rogacheva.
Mech. Solids (USA), vol.17, no.4, p.183-8 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.4, p.200-6 (1982).

The asymptotic method previously proposed is employed to qualitatively investigate the effect of a preliminary static stressed state on free vibrations of shells. The results make it possible, without solving the problem, to estimate the effect of a static load on free vibrations of an arbitrary shell. (6 refs.)

61447 An algorithm for kinetoelastodynamic analysis of rectilinear element plane mechanisms. M.Buculei, D.Marghitu (Univ. of Craiova, Craiova, Rumania).

Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.27, no.5, p.597-604 (Sept.-Oct. 1982). In French. [received: March 1983]

The algorithm of kinetoelastodynamic analysis is based on the method of successive approximations, having as a starting point the determination of limiting conditions attached to each of the kinematic elements. The integral transformations yield solutions of linear-elastic displacements for vibrations of the kinematic elements of the straight line type. (12 refs.) H.C.B.

61448 On the determination of the frequencies of the lateral vibration of a disc with concentrated masses. I. S.Nishimura (Dept. of Precision Engng., Tohoku Univ., Sendai, Japan).

Technol. Rep. Tohoku Univ. (Japan), vol.47, no.2, p.175-87 (1982). In English.

A method for obtaining the frequencies of lateral vibration of a disc is presented. The disc is of axisymmetrically variable thickness, has concentrated masses attached at arbitrary places and is clamped at the inner edge and free at the outer edge. It is quite troublesome to find frequencies of the vibration because the fundamental differential equation of vibration has singularities due to the concentrated masses. In this paper, an integral equation is derived by applying Green's formula to the fundamental equation for the Green function to avoid this difficulty. This method allows a larger part of the determination of the frequencies of the vibrations to be made through analytical treatments and thus is considered to be very useful in this kind of problem. (5 refs.)

61449 Numerical ways of solving the problems of vibrations of thin plates subjected to impact loads. Zh.N.Dmitrieva, E.V.Nikiforova, V.L.Fomin.
Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR), no.1, p.111-14 (Jan. 1983). In Russian.

Non-linear vibrations of a thin circular plate under the action of impact normal loads are studied. Vibrations for large deflections of elastic plates and the bending vibrations of elastic-plastic plates are investigated. A numerical technique on the basis of the finite difference method is developed. (2 refs.)

61450 Appearance aspects of isochromatic mode-I crack tip fringe loops. H.-P.Rossmann (Tech. Univ. Wien, Wien, Austria).

Acta Mech. (Austria), vol.47, no.1-2, p.53-64 (1983). A special perturbation method is employed to demonstrate how the non-singular stress fields associated with the Taylor-series expansions of a pair of Westergaard type stress functions $Z(z)$ and $Y(z)$ will influence the configuration of the isochromatic fringe loops in the vicinity of static crack tips. (9 refs.)

61451 Some remarks on elastic fracture mechanics. P.Destuynder (Dept. Mecanique et Modeles Numeriques, Electricite de France, Paris, France), M.Djaoua, S.Lescure.

Bull. Dir. Etud. & Rech. Ser. C (France), no.2, p.5-26 (1982). In French. A thermodynamical approach of propagation laws in elastic media is given. From a particular choice of an energy dissipation potential, the authors deduce some propagation laws corresponding to particular loading cases. Finally a new computational method of the energy release rate is suggested and discussed. (25 refs.)

61452 Work of spalling fracture. G.I.Kanel'.
Combust. Explos. & Shock Waves (USA), vol.18, no.4, p.461-4 (July-Aug. 1982). Translation of: *Fiz. Goreniya & Vzryva (USSR)*, vol.18, no.4, p.84-8 (July-Aug. 1982). [received: March 1983]

Methods of estimating the work of fracture by means of the results of two kinds of experiments are discussed. The authors consider the energy balance in a plate of thickness L after the insertion of one-dimensional compression wave in which the total energy increment per unit area is E_0 , while the momentum is P_0 . Because of multiple passages through the plate, the compression wave damps out therein, and its energy goes partially over into kinetic energy of the plate as a whole and partially is expended in dissipative processes, including fracture. (11 refs.)

61453 Interaction between the edges of a crack in a complexly loaded state. Yu.V.Zhitnikov, B.M.Tulinov.

Mech. Solids (USA), vol.17, no.4, p.152-6 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.4, p.168-72 (1982).

As a rule, in analyzing crack equilibrium, shear motion of the edges relative to one another over the entire length of the crack has been allowed. This assumption makes it possible to consider only a limited class of problems in which the loading process cannot simultaneously involve regions of relative movement of the edges and regions in which there is no such movement. The authors propose a way of distinguishing such regions in calculating limiting equilibrium of a rigid body with a crack, and also establish how the final stressed state depends on the loading trajectory. (7 refs.)

61454 Formation of fracture structures of weakly interacting cracks. R.V.Gol'dshteyn, A.V.Kapstov.

Mech. Solids (USA), vol.17, no.4, p.157-66 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.4, p.173-82 (1982).

Considers features of the formation of three-dimensional fracture structures, whose elements are plane cracks (separation or shear cracks) that arise at considerable distances from one another, so that their interaction may be regarded as weak and can be taken into account by summing the perturbations of the elastic field caused by individual cracks. The situation, frequently encountered in practice, in which the material, by virtue of its structure, texture, and so forth, possesses a certain geometry of weakened places is analysed. The authors distinguish the following forms of weakened zones: a system of parallel planes and parallel straight lines; crossed straight lines; and single straight line, which are characteristic of many natural and artificial materials. As an example, one can cite low- and medium-strength construction seals with pronounced 'striation' and some forms of laminar or fiber composite materials. Anisotropy of strength properties caused by structural features of the material frequently manifests itself more strongly than anisotropy of the deformation properties; this occurs, e.g., in striated steels. (16 refs.)

61455 Combined models of fracture and their use in predicting service life. V.V.Bolotin (A.A. Blagonravov Inst. of Mech. Engng., Acad. of Sci., Moscow, USSR).

Sov. Mater. Sci. (USA), vol.18, no.3, p.195-201 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.3-12 (May-June 1982). [received: Feb. 1983]

Combined phenomenological and structural models of fracture are investigated in relation to the prediction of service life. The general approaches presented are applied to materials of different structures, and in particular to fibre reinforced composites. (15 refs.)

61456 Equivalence of the energy and force approaches in the theory of cracks in the general case of two-dimensional loading. N.B.Romal's (Lenin Komsomol Voronezh State Univ., USSR).

Sov. Mater. Sci. (USA), vol.18, no.3, p.202-4 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.12-15 (May-June 1982). [received: Feb. 1983]

An analog of the Griffith-Irwin criterion of fracture is constructed for a crack of arbitrary form in the general case of a two-dimensional load. (8 refs.)

61457 Stressed state of a square sample for crack resistance tests of sheet materials. M.P.Savruk, S.Ya.Yarema, P.N.Osiv (G.V. Karpenko Physico-mech. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.3, p.240-4 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.57-63 (May-June 1982). [received: Feb. 1983]

Investigation of the stressed state at the tip of a crack in design elements is the original stage in predicting their effectiveness and life. The accomplishment of such an investigation is eased to a significant degree as a result of development of the method of singular integral equations for the solution of plane problems of the theory of elasticity for multiply connected areas weakened by holes and cracks. This method was used for determining the stress intensity factors in a square plate in tension, which is proposed as an alternative to a disk sample for crack resistance testing of sheet materials. The sample was loaded the same way as a disk sample and was similarly by two forces applied to circular rigid inclusions. (7 refs.)

46.30P Friction, wear, adherence, hardness, mechanical contacts

- 61458** Nonsteady interaction between a die and an elastic medium. V.A. Babeshko, Zh.F. Zinchenko, A.V. Smirnova. *Mech. Solids (USA)*, vol.17, no.4, p.123-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.4, p.136-40 (1982).
 Considers problems of interaction between an elastic laminar medium and a rigid die that occupies region Ω that is arbitrary in plan, under the assumption that the contact is frictionless and the die either moves in accordance with a specified law over time or has a nonsteady wave incident on it. The boundary-value problem is reduced to an integral equation of the first kind that depends on the parameter of the Laplace transformation, for which the authors establish uniqueness and solvability theorems and investigate the properties of the solution. To construct the solution, after analyzing the available approaches to numerical inversion of the Laplace transformation, the method of Tikhonov (1963) is employed, this method being the most efficient and convenient for the given class of problems. (9 refs.)
- 61459** Analysis of a free boundary problem in partial lubrication. G. Bayada (Inst. National. des Sci., Appliquées de Lyon, Villeurbanne, France), M. Chambaut. *Q. Appl. Math. (USA)*, vol.40, no.4, p.369-75 (Jan. 1983).
 Hydrodynamic lubrication is concerned with a particular form of creeping flow between surfaces in relative motion where cavitation takes place. The determination of the free boundary of the cavitation area is then of fundamental importance for the computation of the characteristics of the mechanisms. Different conditions at the free boundary have been introduced. The authors study two of them and compare corresponding solutions with respect to film extent and pressure repartition. (11 refs.)

46.30R Measurement methods and techniques

(see also 07.10 Mechanical instruments and techniques, 81.70 Materials testing)

- 61460** Detection of deformations obtained by a moiré pattern corresponding to a specific grid. H. Annoni (Ecole Nat. Supérieure des Arts et Industries, Strasbourg, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.1, p.39-41 (10 Jan. 1983). In French.
 A method is presented for testing the conformity of an object with a model by means of a projection of a grid (specially calculated from the shape of the model) on the object and observing a moiré pattern: the fringes are straight lines if the object has the right shape. (3 refs.)
- 61461** On the measurement of visco-elastic properties of matters by the Mossbauer effect. F.E. Fujita (Dept. of Material Phys., Osaka Univ., Toyonaka, Japan). *Jpn. J. Appl. Phys. Part I (Japan)*, vol.22, no.3, p.475-9 (March 1983).
 A technique to measure the visco-elastic properties of materials by using the Mossbauer effect is proposed. Assuming that a spring coil specimen is attached to the transducer of Mossbauer spectrometer, which gives a sinusoidal Doppler motion between the gamma ray source and the absorber, the visco-elastic vibration of the specimen is calculated and the mechanical resonance conditions are found. When the gamma ray source and absorber are connected to the visco-elastic system, the Mossbauer pattern will be subjected to a modulation, from which the elastic constant and the viscosity of the specimen can be measured, especially from the mechanical resonance condition. A variety of ways of connection between the mechanical and Mossbauer system are considered and applications of the technique are discussed. (15 refs.)
- 61462** Laser speckle technique in displacement measurement near a crack tip. Z.Q. Tan, K.C. Wu, C.H. Cheng, S.S. Chern, C.C. Hsiao (Dept. of Aerospace Engng. & Mech., Univ. of Minnesota, Minneapolis, MN, USA). *J. Appl. Phys. (USA)*, vol.54, no.4, p.1651-5 (April 1983).
 The laser speckle method has been found quite useful in obtaining in-plane displacement measurements. It is especially useful if the displacement field in a small region can be effectively determined. By obtaining directly the speckle patterns at higher magnifications, a better distinction of the displacements in the vicinity of a crack tip is possible. In this short report some results are obtained and compared with those calculated from linear fracture mechanics and the finite element method for an aluminum crack. (5 refs.)
- 61463** Viscoelastic thermal stress analysis. G.W. Scherer (Corning Glass Works, Corning, NY, USA). *J. Non-Cryst. Solids (Netherlands)*, vol.54, no.3, p.223-40 (March 1983).
 The viscoelastic/elastic analogy leads directly to the viscoelastic solution for thermal stresses in a variety of glass-to-metal seals. This paper examines the conditions which must be met for that approach to be applicable, and shows that it cannot be used in most bodies with spatially varying temperature or composition. A method is presented which leads easily to solutions for the stresses in tempered or ion-exchanged plates and in glass-to-glass sandwich seals. In the latter case, calculated stresses agree well with measured stresses reported in the literature. (18 refs.)
- 61464** Speckle-interferometry, a simple method for deformation analysis. H. Schwieger, R. Streubel. *Mater. Test. (Germany)*, vol.25, no.4, p.105-12 (April 1983). In German.
 Speckle-interferometry is a simple method for deformation-analysis of mechanically loaded structures or their models. This method can be applied to both static and dynamic deformation. This method is mainly suitable for the determination of components of the displacement-vector at the surface of a structure and of deflection-gradients of a bend plate. The theoretical fundamentals are presented and the applicability of this method is illustrated with simple test-examples. (40 refs.)
- 61465** Use of nonlinear viscoelastic materials in the polarization-optical method. G.Z. Sharafutdinov. *Mech. Solids (USA)*, vol.17, no.4, p.138-44 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.4, p.151-8 (1982).
 The basis for the application of the polarization-optical method to problems of nonlinear viscoelasticity, or of the method of nonlinear photoviscoelasticity,

is provided by fairly well-developed experimental techniques, the possibility of choosing modes of deformation or loading such that an optically sensitive material possesses nonlinear viscoelastic properties, and also the availability of physically nonlinear theories of viscoelasticity. The author investigates the optomechanical characteristics of optically sensitive materials, and determines their material functions, on the basis of the principal quasi-linear and principal cubic theories. One of the most important aspects of the method, namely modelling of deformation processes in the nonlinear region is also considered. Experiments were conducted using specimens of a material based on ED-6MA epoxy resin with the addition of 25% polyester, as well as polycarbonate specimens. These materials possess the set of properties required for use in photoviscoelasticity. (8 refs.)

- 61466** Passage of light through a general three dimensional model—equations linking characteristic parameters with system parameters. S.Y. Keshavan (Dept. of Mech. Engng., Univ. of the West Indies, St. Augustine, Trinidad). *Strain (GB)*, vol.19, no.2, p.59-62 (May 1983).
 The determination of the secondary principal stress difference and their orientations for a discrete slice of thickness dz along a particular light path in a three dimensional photoelastic model is discussed. These quantities are determined in terms of the characteristic parameters and their variations at discrete points distance x and z - rdz along the light path. The variations of the characteristic parameters are obtained by deriving the equations linking the characteristic parameters for the light path and the system parameters of the discrete element. The validity of the equations so derived has also been checked by applying these equations to the solution of the problem of a uniformly twisted prismatic bar. (4 refs.)
- 61467** Strain field analysis with the X-ray integration method. A. Peiter, W. Lode (Materialprüfamt des Saarlandes, Saarbrücken, Germany). *Strain (GB)*, vol.19, no.2, p.69-75 (May 1983).
 The so-called X-ray $\sin\psi$ method for measuring internal stresses is not always acceptable, because it postulates a constant orthogonal stress distribution in the layer passed by the beam. It is demonstrated that the often measured non-linear distribution of deformations is numerically connected with stress distributions, which are variable and inclined against the surface. The calculation of the internal stresses and their parameters is based on the solution of trigonometric polynomials of the variable ψ with integrals. The penetration depth of the X-ray beam must be known. For general numeric solutions a computer program can be given. Solutions step by step can be carried out with a programmable pocket calculator. The ' $\sin\psi$ method' is a special case of the integration method, which is still developing. (4 refs.)
- 61468** A simple technique for installing strain gauges on cylindrical surfaces. Sadhu Singh (Coll. of Technol., G.B. Pant Univ. of Agriculture & Technol., Pantnagar, India). *Strain (GB)*, vol.19, no.2, p.77-8 (May 1983).
 A simple technique for the installation of strain gauges on circular and conical cylindrical surfaces is described. The technique may be adopted in an experimental stress analysis laboratory where sophisticated equipment is not available. (3 refs.)
- 61469** Study of deformed samples using an interferometer attached to the sample. V.A. Zhilkin, S.I. Gerasimov (Inst. of Railroad Engrs., Novosibirsk, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1276-9 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2079-85 (Oct. 1982). [received: April 1983]
 It is suggested that holographic interference patterns recorded in oppositely directed beams as proposed by Yu.N. Denisyuk be used to study static problems in the mechanics of deformed samples. The photographic plates are attached to the surface of the sample on top of an intermediate optically transparent material. The effects of the rigidity of the photographic plate and optically transparent material on the measured deformations and the vibrational noise reaching the photographic plate are estimated. Equations are derived which relate the displacements of points on the deformed sample surface to the difference in path lengths of the interfering waves. The method is illustrated by considering the deformed state of a spherically stressed sample using a slit condenser. (11 refs.)

47.00 FLUID DYNAMICS

(for fluid dynamics of quantum fluids, see 67.; for geophysical fluid dynamics, see 92.10; for astrophysical gas dynamics, see 95.30; for biological fluid dynamics, see 87.45)

47.10 GENERAL THEORY

(see also 03.40G Mathematical aspects)

61472 Steady state thermodynamics and spatial correlations. J. Keizer (Chem. Dept., Univ. of California, Davis, CA, USA). *Physica A (Netherlands)*, vol.118A, no.1-3, p.350-9 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

The formulation of thermodynamic functions based on the statistical distribution of extensive variables at nonequilibrium steady states is reviewed. The case of Couette flow is considered, and the necessity of introducing functionally dependent state functions is discussed. Using these techniques the author gives a consistent derivation of the equations used by Hanley and Evans (1982) to analyze their computer dynamics calculations of homogeneous shear flow. Finally, the connection between thermodynamic state functions and spatial correlations is illustrated for a solution phase chemical reaction scheme. (18 refs.)

61473 Number of modes governing two-dimensional viscous, incompressible flows. C. Foias (Indiana Univ., Bloomington, IN, USA), O.P. Manley, R. Temam, Y.M. Treve. *Phys. Rev. Lett. (USA)*, vol.50, no.14, p.1031-4 (4 April 1983). Recent efforts to estimate the number of modes sufficient for the approximate solutions of Navier-Stokes equations in two dimensions are summarized. Several such estimates have been obtained, and their relations to one another are discussed. The physical significance of the results is noted and used to infer the possible nature of similar estimates in three dimensions. (13 refs.)

47.15 LAMINAR FLOWS

61474 RTD for diffusion-free laminar flow of non-Newtonian fluids through coiled tubes. A.K. Saxena, K.M. Nigam, K.D.P. Nigam (Dept. of Chem. Engng., Indian Inst. of Technol., New Delhi, India). *Can. J. Chem. Eng. (Canada)*, vol.61, no.1, p.50-2 (Feb. 1983). The residence time distribution (RTD) for diffusion-free laminar helical flow of non-Newtonian fluids has been numerically computed for values of the power-law index from 0.2 to 2.0. Experimental verification is also provided. Excellent agreement is also shown with independently calculated RTDs appearing in the literature. (13 refs.)

61475 Laminar dispersion in helically coiled tubes of square cross-section. A.K. Saxena, K.D.P. Nigam (Dept. of Chem. Engng., Indian Inst. of Technol., New Delhi, India). *Can. J. Chem. Eng. (Canada)*, vol.61, no.1, p.53-7 (Feb. 1983). In coiled tubes of non-circular cross-section the orientation of the cross-sectional plane with respect to the direction of the centrifugal force has a significant effect on residence time distribution (RTD) which has been recognized for the first time. This aspect has been experimentally investigated in helically coiled tubes of square cross-section, under the conditions of negligible and significant molecular diffusion. (28 refs.)

61476 Computer 'experiment' for nonlinear thermodynamics of Couette flow. D.J. Evans (Res. School of Chem., Australian Nat. Univ., Canberra, Australia). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.1, p.3297-302 (15 March 1983). Nonequilibrium computer simulations reveal that the equation of state of fluids undergoing shear flow varies with strain rate. This observation prompted the development of a nonlinear generalization of irreversible thermodynamics to describe steady planar Couette flow, very far from equilibrium. In this paper the author uses computer simulation to perform a quantitative test of a prediction of this thermodynamics. The prediction tested is: fluids which exhibit positive shear dilatancy for isothermal shear flow should also cool as the strain rate is increased while keeping the internal energy constant. To perform calculations of this effect a new nonequilibrium molecular dynamics algorithm was developed to simulate Couette flow at constant internal energy. (19 refs.)

47.15C Laminar boundary layers

61477 Plastic boundary layers induced by variable wall friction. D. Durban, M.R. Sitzer (Technion-Israel Inst. of Technol., Haifa, Israel). *Acta Mech. (Austria)*, vol.47, no.1-2, p.161-5 (1983). An introductory exposition of plastic boundary layers has been presented by the authors previously (see *ibid.*, vol.45, p.73-89, 1982), within the context of steady rectilinear flow, of rigid/linear-hardening solids. The main findings were that (a) sufficiently high wall friction induces a plastic boundary layer into the flowing material, and that (b) the extent of that layer increases in the direction of flow. In the present study the authors amplify these results via a more detailed analysis of plastic boundary layers induced by non-uniform wall friction. They focus attention on steady rectilinear flow through circular pipes and employ a suitable Fourier expansion of the resisting shear stress along the wall. A few representative examples are discussed and the corresponding growth of the plastic boundary layers is displayed in accompanying figures. (1 ref.)

61478 A method for an accurate determination of the wall pressure in fluid flows. C. Ducruet (IMFL, Lille, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.5, p.309-12 (7 Feb. 1983). In French. The principle of the method of correction has been presented in a previous article. The formula of correction is completed in incompressible fluid by considering the influence of wall curvature. Then, its validity is checked in flows around a cylinder and an airfoil. (2 refs.)

61479 Boundary layers of a nematic liquid crystal in fine capillaries. A.N. Somov, N.V. Churaev (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR). *Colloid J. USSR (USA)*, vol.44, no.3, p.556-7 (May-June 1982). Translation of: *Kolloid. Zh. (USSR)*, vol.44, no.3, p.614-15 (May-June 1982). [received: Feb. 1983]

It has been observed that in capillaries with a radius $R \leq 7.4 \mu\text{m}$ molecules of a nematic liquid crystal, N-(p-methoxybenzylidene)-p-butylaniline (MBBA), have a planar orientation which becomes homeotropic in capillaries with a large radius. Flowing destroys the homeotropic orientation the more noticeably, the higher the flow velocity v and the larger the radius of the capillary. The thickness of the boundary layers in homeotropic orientation reaches several micrometers when $v = 10^{-2} \text{ cm/sec}$. (5 refs.)

61480 On the slipping boundary condition for low density gas flow. R. Peralta-Fabi (Dept. de Fisica, Univ. Autonoma Metropolitana, Mexico City, Mexico), R. Zwanig. *J. Chem. Phys. (USA)*, vol.78, no.5, p.2525-9 (1 March 1983).

The authors discuss the slipping boundary condition in fluid dynamics. They argue that when the boundary is a well defined and smooth surface, the slipping boundary condition is the correct choice. The Grad 13-moment equations are used to describe the hydrodynamic fields for the slow stationary flow of a viscous compressible and low density fluid. The authors study a planar Couette flow and flow around an arbitrary obstacle. The equations are solved for the flow past a sphere. The drag on the sphere is calculated to second order in the mean free path. (6 refs.)

61481 Anomalies of the laminar flow of a smectic A around a cylindrical obstacle. P. Oswald (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).

J. Phys. Lett. (France), vol.44, no.8, p.L303-9 (15 April 1983). In French. When shearing a homeotropic sample of smectic A, a strong rigidification of the central part of the flow has been observed. This effect has probably to do with the presence of defects that are not visible under the microscope. It subsists when a cylindrical thread is glued on one side of the sample. Two static regions then spread out on both sides of this obstacle. They are connected to the central part of the flow through a thin layer of permeation. An estimate of the dissipation gives the author a rough value of the permeation length, first introduced by de Gennes: $\chi^{-1} = \sqrt{\eta\lambda}$. Lastly the author shows that a dilation under shear leads to a lattice of focal parabola, which is asymmetrical with respect to the obstacle. (9 refs.)

47.15F Stability of laminar flows

61482 Low Reynolds number flow between interrupted flat plates. R.E. Roadman (Fabricating Technol. Div., Alcoa Labs., Alcoa Center, PA, USA), R.I. Lochrke.

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.166-71 (Feb. 1983). The flow between pairs of flat plates was studied experimentally to gain insight into the operation of compact heat exchangers with interrupted surfaces. The plates were tested at low Reynolds number in both water and air streams. The investigation focused on the region of transition from steady to unsteady laminar flow between plates. A critical velocity depends strongly on the thickness of the plates, t , plate length, L , and plate separation distance, $4 \leq L/t \leq 159$, are correlated using plate wake width as a single plate length scale. The downstream, plate was found to have a pronounced upstream influence may be lower than that required to produce detectable oscillations at the same point in the upstream plate wake in absence of the second plate. This feedback effect may be responsible for the relative insensitivity of the results to the turbulence level in the free stream. (14 refs.)

47.20 HYDRODYNAMIC STABILITY

61483 Hydroelastic effects of separated flow. L.E. Ericsson (Lockheed Missiles & Space Co. Inc., Sunnyvale, CA, USA).

AIAA J. (USA), vol.21, no.3, p.452-8 (March 1983). In a previous publication it was shown that separated flow can cause catastrophic divergent oscillations of an underwater structure that has a low drag cross-sectional profile. In the present paper the analysis is extended to rectangular prismatic sections, and to consider both bending and torsional oscillations. It is shown that the adverse hydroelastic effects of separated flow can be very large, requiring that a fix of some kind is used. Various means by which the hydroelastic instability can be avoided are described. (17 refs.)

61484 Subharmonic oscillations of a mixing layer-wedge system associated with free surface effects. S. Ziada (Labs. for Vibrations & Acoustics, Sulzer Bros., Winterthur, Switzerland), D. Rockwell.

J. Sound & Vib. (GB), vol.87, no.3, p.483-91 (8 April 1983). An unstable mixing layer, in conjunction with free surface wave effects, can give rise to well-defined subharmonic oscillations of the vortex shedding frequency provided certain streamwise phase conditions are satisfied. Visualization of these oscillations, forces acting on the impingement edge, and streamwise evolution of velocity spectra are addressed. (5 refs.)

61485 Kinetics of fluctuations for systems undergoing phase transition—interfacial approach. K. Kawasaki, T. Ohta (Dept. of Phys., Kyushu Univ., Fukuoka, Japan). *Physica A (Netherlands)*, vol.118A, no.1-3, p.175-90 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

Studies on kinetics of fluctuations in quenched fluid systems are reviewed on the basis of a new dynamical interfacial model. All the processes known to take place in critical fluid mixtures are identified for this model. The authors briefly discuss the Ostwald ripening and the interface stability with this model. An analogy with fully developed turbulence is noted and a possibility of intermittent states is indicated. (33 refs.)

61486 What causes noise in a convecting fluid? J.P.Gollub (Phys. Dept., Haverford Coll., Haverford, PA, USA). *Physica A (Netherlands)*, vol.118A, no.1-3, p.329-34 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

Several different sources of hydrodynamic noise have been found in recent experiments on convecting fluids, including long-lived complicated transients associated with pattern evolution and noise due to secondary instabilities. In other circumstances strange attractors or stochastic models are required to explain the data. (12 refs.)

61487 Stratification instability of switching front in an active trigger diffusive medium. Yu.I.Balkarei, A.A.Zakharova (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1148-50 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1871-3 (Sept. 1982). [received: April 1983]

Considers a simple model of a diffusion active trigger medium, a model in which an exact expression can be obtained for the shape of a stationary switching front (domain wall) and a detailed study can be made of the spectrum and shape of linear fluctuations, leading to periodic stratification of the front. The mathematical model of an autowave medium, that is used, consists of the well known system of Fitz-Hugh-Nagumo equations, generalized by the introduction of anisotropic diffusion coefficients. 47.25 TURBULENT FLOWS, CONVECTION, AND HEAT TRANSFER

61488 Measurements of the coherence of the fluctuating pressure field on a square prism placed in a turbulent flow. J.-P.Huot, H.Arbej, C.Rey (Lab. de Mecanique des Fluides, Ecole Centrale de Lyon, Ecully, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.5, p.305-8 (7 Feb. 1983). In French.

A study of the fluctuating pressure field on a square prism placed in a turbulent stream was undertaken. An experimental investigation including the measurements of the characteristics of the incident turbulent flow as well as those of the induced pressure field was realized. The various mechanisms which contribute to the generation of the unsteady pressure field are analysed. (4 refs.)

47.25C Isotropic turbulence

61489 Thresholds for the onset of fluid and magnetofluid turbulence. D.Montgomery (Phys. Dept., Coll. of William & Mary, Williamsburg, VA, USA).

Phys. Scr. (Sweden), vol.T2, no.2, p.506-10 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Hydrodynamic stability theory has focused on a few simple test cases to obtain the sharpest possible confrontations between theory and experiment. Six of these are briefly reviewed: plane Poiseuille and Couette flow, pipe flow, rotating Couette flow, thermally-driven Bénard convection, and the Blasius laminar boundary layer. Linear perturbation theory seems inadequate in the first three cases, and satisfactory in the last three. Insufficient information, experimental or theoretical, exists in magnetohydrodynamics to make any comparably decisive tests. (33 refs.)

61490 Turbulence measurements in wall jets along strongly concave surfaces. R.Kobayashi, N.Fujisawa (Tohoku Univ., Sendai, Japan). *Acta Mech. (Austria)*, vol.47, no.1-2, p.39-52 (1983).

The present experiment found that turbulence intensities in turbulent wall jets along a concave surface increase remarkably, when the radius of curvature becomes smaller beyond a certain condition. The critical condition is discussed in comparison with the Taylor-Görtler instability for turbulent wall jets. The measurements are also made for the mean velocity field, the Reynolds stress, the turbulence energy balance and the velocity correlations. (8 refs.)

61491 An unsteady interactive separation process. L.L.van Dommelen, S.F.Shen (Cornell Univ., Ithaca, NY, USA). *AIAA J. (USA)*, vol.21, no.3, p.358-62 (March 1983).

Recently, Sychev addressed the question of unsteady separation moving upstream along the wall. Here, by a least-square procedure, an interaction solution is shown to exist in which the boundary-layer approximation remains uniformly valid. No additional vortex layers are introduced in the interaction region, thus avoiding the difficulties inherent in Sychev's proposal. Remarkably, according to the solution, the principal mechanics of separation is a bifurcation-free divergence of streamlines. (13 refs.)

61492 Comment on 'Improved method for the measurement of turbulence quantities'. M.K.Swaminathan, G.W.Rankin, K.Sridhar (Univ. of Windsor, Windsor, Canada), S.Sampath, V.Ganesan, B.H.L.Gowda. *AIAA J. (USA)*, vol.21, no.3, p.476-7 (March 1983).

Swaminathan et al. comment on the work of Sampath et al., discussing a number of points which are likely to prove vital in improving the results of the present method and in ensuring that proper comparisons are made with results of others. Sampath et al. reply back to these comments highlighting the flaws present. (6 refs.)

61493 Spatial periodicity of the mean static pressure gradient in turbulent pulsating flow. S.Burnel, J.-M.Thomas (Univ. d'Orleans, Orleans, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.3, p.165-8 (24 Jan. 1983). In French.

For an unsteady fully developed flow, the study of the mean values shows that the velocity profiles are independent of the pulsations; on the other hand, the amplitude of the static pressure gradient variations can reach $\pm 70\%$ of the steady pressure gradient value. The results indicate that the mean value of the friction factor is equal to that of the associated steady flow if the correlation which exists between the longitudinal gradient of the velocity modulation and that of the mean static pressure is taken into account. (3 refs.)

61494 The distortion of turbulence by a flat plate and its relevance to the pressure fluctuation on the obstacle. J.-P.Huot, H.Arbej, C.Rey (Ecole Centrale de Lyon, Ecully, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.4, p.213-16 (31 Jan. 1983). In French.

A study of the distortion of turbulence upstream of a flat plate placed normal to the mean flow is undertaken in the case when the integral scale of turbulence is small with respect of the width of the obstacle. An experimental investigation is performed, including measurements of the evolution of turbulence intensities and longitudinal spectra for different locations along the stagnation streamline. A comparison between the experimental results and those inferred from theory is given. (8 refs.)

61495 Influence of free-stream turbulence on turbulent boundary layer heat transfer and mean profile development. I. Experimental data. M.F.Blair (Trans. ASME, J. Heat Transfer (USA), vol.105, no.1, p.33-40 (Feb. 1983).

An experimental research program was conducted to determine the influence of free-stream turbulence on zero pressure gradient, fully turbulent boundary layer flow. Convective heat transfer coefficients and boundary layer mean velocity and temperature profile data were obtained for a constant free-stream velocity of 30 m/s and free-stream turbulence intensities ranging from approximately 1/4 to 7 percent. Free-stream multicomponent turbulence intensity, longitudinal integral scale, and spectral distributions were obtained for the full range of turbulence levels. The test results with 1/4 percent free-stream turbulence indicate that these data were in excellent agreement with classic two-dimensional, low free-stream turbulence, turbulent boundary layer correlations. For fully turbulent boundary layer flow, both the skin friction and heat transfer were found to be substantially increased (up to ~ 20 percent) for the higher levels of free-stream turbulence. (35 refs.)

61496 Influence of free-stream turbulence on turbulent boundary layer heat transfer and mean profile development. II. Analysis of results. M.F.Blair (United Technol. Res. Center, East Hartford, CT, USA).

Trans. ASME, J. Heat Transfer (USA), vol.105, no.1, p.41-7 (Feb. 1983). For pt.I see *ibid.*, vol.105, p.33 (1983). An experimental research program was conducted to determine the influence of free-stream turbulence on zero pressure gradient fully turbulent boundary layer flow. In pt. I of this paper, convective heat transfer coefficients, boundary layer mean velocity and temperature profile data, as well as wall skin friction coefficient distribution data were presented for five flow conditions of constant free-stream velocity (30 m/s) and free-stream turbulence intensities ranging from approximately 1/4 to 7 percent. These data indicated that the turbulence and significant effects on both the turbulent boundary layer skin friction and heat transfer. In the current paper, these new data are compared to various independent experimental data and analytical correlations of free-stream turbulence effects. This analysis has shown that the effects documented in pt. I were a function of the free-stream turbulence intensity, the turbulence length scale, and the boundary layer momentum thickness Reynolds number. In addition, the Reynolds analogy factor ($2St/c_p$) was shown to increase by just over 1 percent for each 1 percent increase in free-stream turbulence level. New correlations for the influence of free-stream turbulence on skin friction, heat transfer, and the Reynolds analogy factor are presented. (20 refs.)

61497 An investigation into noise radiation from flow control valves with particular reference to flow rate measurement. K.A.El-Shorbagy (Faculty of Engng., Alexandria Univ., Alexandria, Egypt). *Appl. Acoust. (GB)*, vol.16, no.3, p.169-81 (1983).

Flow control valve noise has been investigated, both analytically and experimentally, for two cases of variable orifice area and variable mass flow rate. The analysis is based on Lighthill's (1952, 1954) acoustic analogy, together with Curle's (1955) theory for noise generation from fluid-solid boundary interactions. Results indicate that monitoring sound levels of valve noise could be useful as a feasible means for flow rate measurements and online automatic flow control in pipes. (19 refs.)

61500 A semi-circle theorem in thermohaline convection with rotation and magnetic field. J.R.Gupta, S.K.Sood, R.G.Shandil (Dept. of Maths., Himachal Pradesh Univ., Summer Hill, Simla, India). *Indian J. Pure & Appl. Math.*, vol.14, no.1, p.115-28 (Jan. 1983).

A mathematical analysis of the governing equations of thermohaline convection [Veronis' (1965) configuration] with a uniform vertical rotation and magnetic field for the case of rigid conducting boundaries shows that the complex growth rate p of an oscillatory perturbation, neutral or unstable with wave number $a^2 \geq 0/2\sigma$, must lie inside a semi-circle in the right half of the complex p -plane. A similar result holds good for Stern's (1960) configuration with a uniform vertical rotation and magnetic field. (5 refs.)

61501 Onset of turbulent convection in large cells. E.Siggia (Dept. of Phys., Cornell Univ., Ithaca, NY, USA). *Physica A (Netherlands)*, vol.118A, no.1-3, p.335 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

Summary form only given, as follows. Convection experiments in small aspect ratio (=lateral size/depth) cells have shown many of the sharp changes in temporal properties that are characteristic of low order dissipative dynamical systems. In large cells there are generally no sharp transitions between regimes with different temporal signatures and broad band noise develops relatively smoothly from frequencies. One infers that the multiplicity of spatial patterns allowed in the larger cell is responsible for this difference. Because of the complexity of doing realistic calculations with the Boussinesq equations a number of effects which act together in a real experiment have been isolated for theoretical study. In a third class of problems one seeks to determine the effective long wavelength dynamics of a locally ordered convection pattern following much the same reasoning that takes one from microscopic physics to hydrodynamics. The first equations of this kind that get beyond the Ginzburg-Landau from (which obviously cannot describe persistent time dependent flow) were described by Siggia and Zippelius (1981). (5 refs.)

61502 Time dependence in Rayleigh-Benard convection with a variable cylindrical geometry. R.P.Behringer, H.Gao (Dept. of Phys., Duke Univ., Durham, NC, USA), J.N.Shaumeyer. *Phys. Rev. Lett. (USA)*, vol.50, no.16, p.1199-202 (18 April 1983).

Studies of the first time dependence in Rayleigh-Benard convection in ^4He are reported. The aspect ratio Γ could be varied continuously. Data at 31 Γ values with $4 < \Gamma < 13$ show that near onset the first time dependence is always periodic and associated with changes in the heat transport. The dominant periodicity has a nonzero amplitude, A , and vanishing frequency at onset. Changes in A with Γ show wave-number effects. Except for the time dependence, the transition is consistent with predictions for the skew-varicose instability. (12 refs.)

61503 Heat transfer in hydromagnetic flow near an oscillating porous flat plate. S.Narasimha Murthy, H.M.Thimmarayappa (Coll. of Basic Sci. & Humanities, Univ. of Agricultural Sci., Bangalore, India). *Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania)*, vol.28, no.1, p.33-7 (Jan.-Feb. 1983).

The temperature distribution for the problem of the motion of a viscous incompressible and electrically conducting fluid near an infinite porous flat plate in the presence of a transverse magnetic field fixed relative to the fluid is studied, taking the viscous dissipation into account. It is seen that, in a particular case, the heat flows from the liquid to the plate irrespective of the fact that the plate is maintained at a higher temperature than the ambient liquid. Further, it is observed that suction alone does not affect the conditions of heat transfer. Also, the two different physical mechanisms such as suction and magnetic field have the same effect in regard to the heat transfer. (3 refs.)

61504 Heat transfer coefficients and patterns of fluid flow for contacting spheres at various angles of attack. E.M.Sparrow, R.F.Prieto (Dept. of Mech. Engng., Univ. of Minnesota, Minneapolis, MN, USA). *Trans. ASME. J. Heat Transfer (USA)*, vol.105, no.1, p.48-55 (Feb. 1983).

Wind tunnel experiments were performed to determine heat transfer coefficients and fluid flow patterns for two contacting spheres. The experiments were carried out at three different angles of attack and for Reynolds numbers in the range from 4000 to 26000. Three heat transfer conditions were considered: (a) both spheres thermally active, (b) forwardmost sphere thermally active and rearmost sphere adiabatic, and (c) forwardmost sphere adiabatic and rearmost sphere thermally active. Complementary experiments for a single sphere, encompassing the same parameter ranges, yielded baseline information for comparison with the two-sphere results. It was found that the largest effects of the sphere-to-sphere interaction on the heat transfer occurred when the two spheres were in line. At this orientation and for higher Reynolds numbers in the investigated range, there was substantial enhancement of the heat transfer with respect to that for the single sphere. At the other angles of attack, there was lesser enhancement. The visualization studies revealed such key fluid flow features as the reattachment of the separated flow from the first sphere on the second, the presence of strong recirculations, and the delay of separation due to pressure-driven transverse flows. (8 refs.)

61505 Heat transfer from the heated convex wall of a return bend with rectangular cross section. N.Seki, S.Fukusako, M.Yoneta (Dept. of Mech. Engng., Hokkaido Univ., Sapporo, Japan). *Trans. ASME. J. Heat Transfer (USA)*, vol.105, no.1, p.64-9 (Feb. 1983).

An experimental investigation has been performed to clarify the turbulent heat transfer characteristics along the heated convex wall of a return bend which has a rectangular cross section with large aspect ratio for various heights of the duct. The experiments are carried out under the condition that the convex wall is heated at constant heat flux while the concave wall is insulated. Water is used as the working fluid with duct heights of 15, 40, 60 and 80 mm, Reynolds numbers of 8×10^3 to 8×10^4 , and Prandtl numbers ranging from 6.5 to 8.5. The mean and the local heat transfer coefficients are always smaller than those for the straight parallel plates and straight ducts. Both the local and the mean heat transfer coefficients decrease as the duct height increases. Near the outlet region of the return bend the local heat transfer coefficient increases in the flow direction as the height decreases. Behavior is just the opposite at the inlet. Correlation equations for the mean and the local Nusselt numbers are determined in the range of parameters covered. (11 refs.)

61506 Buoyancy effects on a boundary layer along an infinite cylinder with a step change of surface temperature. L.S.Yao (Dept. of Mech. & Aerospace Engng., Arizona State Univ., Tempe, AZ, USA). *Trans. ASME. J. Heat Transfer (USA)*, vol.105, no.1, p.96-101 (Feb. 1983).

The laminar boundary layer induced by a horizontal forced flow along an infinite vertical cylinder with a step change of surface temperature is studied by a finite-difference method. Close to the thermal leading edge, the buoyancy force induces a strong free-convection boundary layer. Slightly above the thermal leading edge, the boundary layer starts to separate at the rear stagnation line ($\phi = 180$ deg). The region of separated flow grows toward the forward stagnation line and becomes stationary at ≈ 104 deg as one moves upward. In other words, free convection dominates the heat transfer along the thermal leading edge. The importance of forced convection increases as one moves vertically from the thermal leading edge and eventually becomes the dominant mode. The numerical results show that the free-convection boundary layer is suppressed at the forward stagnation line and is carried toward the rear stagnation line by the forced convection. The phenomenon shares many similarities with a thermal plume affected by forced convection. (13 refs.)

61507 Natural convection heat transfer of water within a horizontal cylindrical annulus with density inversion effects. P.Vasseur, L.Robillard, B.Chandra Shekar (Dept. of Civil Engng. Ecole Polytech., Univ. de Montreal, Montreal, Quebec, Canada). *Trans. ASME. J. Heat Transfer (USA)*, vol.105, no.1, p.117-23 (Feb. 1983).

The effect of density inversion on steady natural convection heat transfer of cold water, between two horizontal concentric cylinders of gap width, L , is studied numerically. Water near its freezing point is characterized by a density maximum at 4°C . Numerical solutions are obtained for cylinders with nonlinear Rayleigh numbers RA ranging from 2×10^3 to 7.6×10^4 , a radius ratio $1.75 \leq r_a \leq 2.6$ and an inversion parameter γ , relating the temperature for maximum density with the cavity wall temperatures, between -2 and 2 . The results obtained are presented graphically in the form of streamline and isotherm contour plots. The heat transfer characteristics, velocity profiles, and local and overall Nusselt numbers are studied. The results of the present study were found qualitatively valid when compared with an experimental investigation carried out in the past. (28 refs.)

61508 Self-excited wave oscillations in a water table. W.Calarese, W.L.Hankey (Air Force Wright Aeronautical Labs., Wright-Patterson AFB, OH, USA). *AIAA J. (USA)*, vol.21, no.3, p.372-8 (March 1983).

An experimental investigation has been performed on self-excited wave oscillations on cavity, spike-tipped, and inlet models in a water table. Buzzing was generated by positioning the models at a small angle of attack with respect to the freestream flow. The hydraulic analogy was used to compare the results obtained in water to results obtained in gas. High-speed and real-time photography were used in the experiment. The frequencies of oscillations in water and air were consistent with the hydraulic analogy. Numerical solutions of the phenomenon were also obtained. (10 refs.)

61509 Comment on 'Inviscid solution for the secondary flow in curved ducts'. N.H.Kemp (Phys. Sci. Inc., Andover, MA, USA). *AIAA J. (USA)*, vol.21, no.3, p.477-8 (March 1983).

The author comments on the equations solved by Abdallah and Hamed for inviscid, incompressible steady flow in curved ducts. It is pointed out that these equations are in fact the continuity equation and two components of the vector vorticity equation (the steady Helmholtz equations). The nature of these equations is briefly studied and the point is made that nothing new is presented. (3 refs.)

61510 On the use of the rotating disc electrode. J.-L.Bousgarbier, J.Pechoux (Lab. d'Etudes Aérodynamiques et Thermiques, Poitiers, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.3, p.161-3 (24 Jan. 1983). In French.

61511 Stabilisation of the solution for a system of rotating compressible fluid. P.K.Pal (Dept. of Differential Equations & Functional Analysis, Patrice Lumumba Univ., Moscow, USSR). *Indian J. Pure & Appl. Math.*, vol.14, no.1, p.108-14 (Jan. 1983).

The system of partial differential equations of motion of a rotating compressible ideal fluid is considered. Using the explicit form of the solution the behaviour as $t \rightarrow \infty$ of the solution is investigated. Stabilisation of the solution in the case of an external force, independent of time is established. (6 refs.)

61512 Experiments on the stable biased flow through a flat-plate row. M.Hayashi, A.Sakurai, Y.Ohya. *Technol. Rep. Kyushu Univ. (Japan)*, vol.55, no.4, p.399-406 (Aug. 1982). In Japanese. [received: Feb. 1983]

When a row of multiple flat plates is arranged side by side to the approaching flow, the flows passing through the slits (gap flows) are biased either upward or downward in a stable manner if the slit ratio (ratio of the slit width to the plate width) is small. What causes the biasing and how stable it are are investigated experimentally at both low and high Reynolds numbers ($Re=30-120$ and 10^4). When the slit ratio is very small, the gap flow acts like a simple bleed, and it seems to be biased owing to the Coanda effect between the gap flow and the outer shear layer. When the slit ratio is increased, the individual plate on the biased side makes distinct vortex shedding. In this case, the biased gap flow is strongly related to the vortex shedding of each plate and the stability of the biasing is due to the dominant vortex formation and shedding from the plate on the biased side. These vortices formed behind the biased side engulf the gap flow ceaselessly and prevent the plate on the unbiased side from making its own vortex formation. (8 refs.)

Combust. & Flame (USA), vol.50, no.2, p.207-18 (March 1983). Describes the results of the reparameterization studies on the Becker-Kistiakowsky-Wilson (BKW) equation of state (EQS) for water-gel explosives. The original set of BKW parameters ($\alpha=0.5$, $\beta=0.1$, $\kappa=11.85$, and $\theta=400$) predicts a higher detonation velocity and detonation pressure and a lower detonation temperature compared with the experimental values for these explosives. Among the several combinations of parameters examined, the following set— $\alpha=0.5$, $\beta=0.1$, $\kappa=8.85$, and $\theta=1850$ —is found to give realistic values for the various detonation properties. Moreover, the predicted and the experimental detonation velocities are seen to be in fair agreement. A comparison of the computed and the experimental (obtained from Crawshaw-Jones measurements) fume characteristics shows that (1) inclusion of the wrapper material in the explosive composition increases the concentration of fumes and gives correspondence between the two for products such as CO , H_2 , NH_3 , and CH_4 , (2) the measured NO_x concentration is difficult to get in these computations, and (3) calculations of the product compositions for the isentropic expansion of detonation products along the Chapman-Jouguet (C-J)

isentropic give freeze-out temperatures in the range of 1000-1800K. These computations were also performed for two ammonium nitrate-fuel oil mixtures and are found to be in good agreement with the experimental data. (27 refs.)

61516 Experimental study on cylindrical and spherical implosions. K.Terao (Dept. of Mech. Engng., Yokohama Nat. Univ., Yokohama, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.3, p.446-53 (March 1983).

Cylindrically and spherically imploding detonation waves in a stoichiometric propane-oxygen mixture, produced in vessels of about 40 cm internal diameter having different convergent spaces, were experimentally investigated by applying a radially divergent detonation. The experimental results have shown that the ratio of the pressure P behind the imploding detonation waves to the initial mixture pressure P_0 is related to the radial distance r from the implosion center to the detonation front. The pressure increases with the propagation of the imploding detonation in every case higher than the theoretical one. (14 refs.)

61517 Acoustic wave radiated by head-on collision of two vortex rings. T.Kambe, T.Minota (Dept. of Appl. Sci., Kyushu Univ., Fukuoka, Japan). *Proc. R. Soc. London Ser. A (GB)*, vol.386, no.1791, p.277-308 (8 April 1983).

An attempt has been made to detect the acoustic wave radiated by the collision of two vortex rings and to compare it with predictions made by the theory of aerodynamic sound with and without fluid viscosity. It has been found that the detected acoustic pressure p obeys the scaling law $p \propto (\rho_0/c^2)U^4R/r$ predicted by the theory. Analysis of the observed signals shows that the acoustic pressure is composed of quadrupole and monopole radiation. Although the inviscid theory can account for the initial part of the detected signal quantitatively, it fails to predict the appearance of the monopole, and it is also not possible to give even a qualitative description of the quadrupole in the later stages. A viscous theory is presented to obtain an improved fit to the observed profile; the monopole radiation is related to the viscous decay of total kinetic energy, and the main quadrupole is affected by the decay of the vortex strength as a result of pair annihilation under the action of viscosity. Hence the initial inviscid phase is followed by phases dominated by the action of viscosity. (31 refs.)

61518 The rotary movements of compressible fluids. II. C.Jacob (Univ. de Bucharest, Bucharest, Rumania).

Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.27, no.4, p.437-52 (July-Aug. 1982). In French. [received: March 1983]

For pt.1 see *ibid.*, vol.26, no.3, p.357-69 (1981). Derives the basic equation of steady-state motion with variables referred to a moving coordinates system with a particular application to the plane-parallel case. This provides a definition of two families of curves forming the Mach lines which are real for speeds away from the critical level. The simplified assumptions allow the basic equation for velocities potential to be linearised and used for the theory of thin wings. (2 refs.) I.G.

61519 Navier-Stokes solution on the CYBER-203 by a pseudospectral technique. J.J.Lambiotte (Analysis & Computation Div., NASA Langley Res. Center, Hampton, VA, USA), M.Y.Hussaini, S.Bakhar, S.A.Orszag. 10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.305-7 vol.1

Describes a three-level, time-split, mixed spectral/finite difference method for the numerical solution of the three-dimensional, compressible Navier-Stokes equations developed for and implemented on the Control Data Corporation CYBER-203. This method uses a spectral representation for the flow variables in the streamwise and spanwise coordinates, and central differences in the normal direction. The five dependent variables are interleaved one horizontal plane at a time and the array of their values at the grid points of each horizontal plane is a typical vector in our computation. The code is organized so as to require, per time step, a single forward-backward pass through the entire database. The one- and two-dimensional fast Fourier transforms are performed using software especially developed for the CYBER-203. (5 refs.)

47.40H Transonic flows

61520 Numerical solution of transonic stream function equation. M.Hafez, D.Lovell (George Washington Univ., NASA Langley Res. Centre, Hampton, VA, USA).

AIAA J. (USA), vol.21, no.3, p.327-35 (March 1983). The stream function equation, in conservation form, looks similar to the full potential equation and existing methods (e.g. artificial compressibility) can be readily applied. Rotational flows can be calculated once the vorticity (due to shocks or nonuniformity) is evaluated. There are, however, two main difficulties. The first is that the density is not uniquely determined in terms of the flux (there are two solutions: the subsonic and the supersonic branch with a square root singularity at the sonic point). Methods to overcome this difficulty are studied and results are presented with some remarks on inviscid separation and closed streamlines. The second difficulty, the need of two stream functions for three-dimensional calculations is briefly discussed. (26 refs.)

61521 A finite element formulation for steady transonic Euler equations. A.Eeer, H.U.Akay (Purdue Univ., Indianapolis, IN, USA).

AIAA J. (USA), vol.21, no.3, p.343-50 (March 1983). Solution of two-dimensional, steady, transonic Euler equations is considered. Based on a variational principle, the problem is formulated in terms of three new Clebsch-type variables (ϕ , α , β). After a finite element formulation, a set of nonlinear equations is obtained in terms of these variables. This new formulation allows the Euler equations to be expressed in a second-order form, eliminating the difficulties encountered in the solution of first-order equations. It also provides a unified procedure for isentropic (potential) and nonisentropic (Euler) equations. A relaxation technique is employed to obtain steady-state solutions. Numerical results for flows through a channel are presented to demonstrate the effectiveness and accuracy of the numerical scheme. (14 refs.)

61522 Unsteady transonic flow over wings including inviscid/viscous interaction. D.P.Rizzetta, C.J.Borland (Boeing Military Airplane Co., Seattle, WA, USA).

AIAA J. (USA), vol.21, no.3, p.363-71 (March 1983). A numerical procedure is presented for computing the unsteady transonic flowfield about swept wings undergoing time-dependent motions. The outer

inviscid portion of the flow is assumed to be governed by the modified unsteady transonic small disturbance potential equation which is integrated in the time domain by means of an alternating direction implicit algorithm. Dominant effects of the shock/boundary-layer interaction are accounted for by a simple empirically defined model. Viscous flow regions adjacent to the wing surface and in the trailing wake are described by a set of integral equations appropriate for compressible turbulent shear layers. The two-dimensional boundary-layer equations are applied quasistatically stripwise across the span. Coupling with the outer inviscid flow is implemented through use of the displacement thickness concept. Validity of the assumptions underlying the method is established by comparison with experimental data for the flow about a high aspect ratio transport wing having an advanced airfoil section. (30 refs.)

61523 Correlation of Preston tube data with laminar skin friction. T.D.Reed, A.Abu-Mostafa (Oklahoma State Univ., Stillwater, OK, USA), F.S.Steinle, Jr.

AIAA J. (USA), vol.21, no.3, p.379-80 (March 1983).

The work reported herein constitutes one step in the search for an improved procedure for calibrating the effects of noise on model tests in transonic wind tunnels. Earlier work by Treon et al. (1971) suggested that a sharp-nose 10-deg. cone could be useful in explaining differences between three transonic wind tunnel tests of the same C-5A aircraft model. Subsequently, a comprehensive series of tests were undertaken to measure free transition on a single cone in 23 wind tunnels and in flight. This cone was designated the AEDC Transition Cone and is a sharp-nose 10-deg. cone with a highly polished surface and a traversing mechanism to move a miniature (0.025 cm high) Pitot probe along the surface. The basic purpose of the traversing probe is to detect the location of boundary-layer transition. (9 refs.)

61524 Freestream turbulence and transonic flow over a 'bump' model. S.Raghunathan, R.J.W.McAdam (Queen's Univ. of Belfast, Belfast, N Ireland).

AIAA J. (USA), vol.21, no.3, p.467-9 (March 1983).

In transonic flow, predictions of free-flight conditions from wind tunnel tests need a close simulation of Reynolds number. However, Reynolds number simulation is not adequate, since results from wind tunnel tests are influenced by effects of tunnel environment, such as noise and turbulence levels. A recent paper by the authors (1982), showed a strong influence of turbulence on attached turbulent boundary layers at zero pressure gradient in the Mach number range of 0.8 and boundary-layer momentum thickness Reynolds number range of 3000-10⁴. This note presents the general characteristics of transonic flow over a 'bump' model at various freestream turbulence levels. (5 refs.)

47.40K Supersonic and hypersonic flows

61525 Hypersonic slender-wedge analysis with gradual change in angle of attack. R.N.Gupta (Nasa-Langley Res. Center, Hampton, VA, USA), S.P.Joshi, C.M.Rodkiewicz.

Acta Mech. (Austria), vol.47, no.1-2, p.107-15 (1983).

A slender two-dimensional wedge-wing moving at a high Mach number is subjected to an angle of attack changing exponentially with time. The obtained results give the time history of wall shear, heat transfer, displacement thickness, and viscous induced pressure. The unsteady character of the flow appears to be confined to the initial stages of the change in the angle of attack. (7 refs.)

61526 Flow visualisation methods for separated three-dimensional shock wave/turbulent boundary-layer interactions. G.S.Settles, Hsueh-Ying Teng (Princeton Univ., Princeton, NJ, USA).

AIAA J. (USA), vol.21, no.3, p.390-7 (March 1983).

A collection of techniques is presented for the visualisation of separated turbulent flows at high speeds. Some of these techniques—including a method of generating a localised vapour visualisation—have not been available previously. Others, such as the conical shadowgraph and stereoscopic schlieren methods, have been used before in other contexts. The authors apply all the available techniques to the study of three-dimensional supersonic flows generated by swept compression corners. The paper discusses the techniques and some of the fluid mechanical insights revealed by the visualisations, including the structure of the observed three-dimensional flow separations and associated shock wave systems. (34 refs.)

61527 Body resistance in a detonating gas flow. M.M.Gilinskii, T.S.Novikova.

Combust. Explos. & Shock Waves (USA), vol.18, no.4, p.489-92 (July-Aug. 1982). Translation of: *Fiz. Goreniya & Vzryva (USSR)*, vol.18, no.4, p.114-17 (July-Aug. 1982). [received: March 1983].

Analyses the effect of heat liberation on the value of braking pressure behind a detonation discontinuity. Using the Rankin-Hugoniot relationship on the detonation polarity and the formulas for isentropic compression behind the wave, the authors obtain the ratio of the braking pressure behind the detonation wave p_{01} to the conventional shock wave pressure p_0 . (8 refs.)

61528 An experimental investigation of heat transfer near the leading edge of an inclined flat plate in hypersonic flow. M.Iwasaki, M.Hashiguchi, T.Ueno, O.Kondo.

Technol. Rep. Kyushu Univ. (Japan), vol.55, no.4, p.371-7 (Aug. 1982). In Japanese. [received: Feb. 1983].

The heat transfer near the leading edge of a flat plate at various angles of attack immersed in hypersonic flow is experimentally investigated in a hypersonic shock tunnel with a conical nozzle. Steady heat transfer rates are measured by means of thin film heat transfer gauges at argon test flow Mach numbers around 12, free stream Reynolds numbers of about 0.7×10^6 and 1.5×10^6 per cm, and stagnation temperatures of about 2000°C and 10000°C where the test flow is weakly ionized. A modified Stollery's strong interaction theory which is made by including the source flow effects due to conical nozzle is proposed by applying Hall's small perturbation method. The results of the present approach and Stollery's theory are compared with those of the experiment. It is found that the present method provides the theoretical Stanton number in qualitatively good agreement with the experimental one for the un-ionized gas flow. (12 refs.)

61529 Asymptotic solution near the shock-layer separation point for a hypersonic flow past pointed bodies. V.G.Ignatenko.

Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR), no.1, p.64-9 (Jan. 1983). In Russian.

A perfect gas hypersonic flow for small $\epsilon = (x-1)/(x+1)$ is considered near the shock-layer separation point. An explicit asymptotic solution is found for a large class of pointed bodies with a continuous curvature. (6 refs.)

61530 Strong shock implosion approximate solution. Y.Fujimoto, E.A.Mishkin, C.Alejandro (Polytech. Inst. of New York, New York, NY, USA).

Physica B & C (Netherlands), vol.115 B+C, no.2, p.271-83 (Jan. 1983).

The self-similar, center-bound motion of a strong spherical, or cylindrical, shock wave moving through an ideal gas with a constant $\gamma = c_p/c_v$, is considered and a linearized, approximate solution is derived. An X, Y phase plane of the self-similar solution is defined and the representative curve of the system behind the shock front is replaced by a straight line connecting the mappings of the shock front with that of its tail. The reduced pressure $P(\xi)$, density $R(\xi)$ and velocity $U(\xi)$ are found in closed, quite accurate, form. Comparison with numerically obtained results, for $\gamma = 5/3$ and $\gamma = 7/5$, is shown. (21 refs.)

47.50 NON-NEWTONIAN DYNAMICS

61531 A solvable weak-potential model of a nonNewtonian fluid.

J.C.Rainwater (Nat. Engng. Lab., NBS, Boulder, CO, USA), S.Hess.

Physica A (Netherlands), vol.118A, no.1-3, p.371-82 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

A theoretical model is developed for a nonNewtonian fluid of spherical molecules interacting with a weak potential. The Kirkwood-Smoluchowski equation for planar Couette flow reduces in leading order in potential strength to a shear-diffusion equation with an inhomogeneous source term. The pressure tensor elements are calculated and, for a Gaussian potential, reduce to one-dimensional integrals which are evaluated numerically. The model reproduces several qualitative features of nonNewtonian liquids and the computer simulations of Evans and Hanley (1980). These features include shear thinning, shear dilatancy, normal pressure differences and dependence on shear rate to a half-integer power. (20 refs.)

47.55 NONHOMOGENEOUS FLOWS

47.55B Cavitation

61532 Recombination mechanism for emission accompanying collapse of a cavitation bubble induced by a high-voltage electrical discharge. P.I.Golubnichii, V.M.Gromenko, A.D.Filonenko (Voroshilovgrad State Univ., Voroshilovgrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1208-11 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1966-71 (Oct. 1982). [received: April 1983].

A recombination mechanism for emission associated with collapse of a cavitation bubble induced by a high-voltage electrical discharge in liquid is found experimentally and confirmed by numerical estimates. The recombination mechanism is found to be predominant when bubbles are formed by relatively long (~ 0.1 of the collapse period) discharges in chlorine-containing liquids (carbon tetrachloride, chloroform). These liquids have a high saturated vapor pressure, so that the ratio of the maximum to the minimum bubble diameters is small. Elementary estimates of the duration of the light pulse and an examination of the form of the light pulse associated with plasma 'chilling' give results in good agreement with experiment. (9 refs.)

Analysis of a free boundary problem in partial lubrication See Entry 61459

47.55C Jets

61533 Investigation of water jet pulses generated by an impact piston device. G.Rehbinder (Swedish Rock Mech., Res. Foundation, Stockholm, Sweden).

Appl. Sci. Res. (Netherlands), vol.40, no.1, p.7-37 (1983).

High speed water pulses for destruction of rock, concrete etc. have been studied for more than a decade. The high speed pulses can be created in different ways and some investigations have been published about supersonic pulse generators. In this paper a device called impact pipe is studied theoretically as well as experimentally. In an impact pipe the impact velocity of a piston is transferred to pressure in a pressure chamber provided with a small nozzle through which a jet comes out. It is shown that theoretically the maximum pressure of 400 MPa is achieved if the length of the impacting piston is sufficiently long. Pressure measurements and high speed photography show that the water pulse coming out through the nozzle has violent radial bursts due to the pressure waves in the pressure chamber. (26 refs.)

61534 Conventional profile coaxial jet noise prediction. J.R.Stone, D.E.Groesbeck, C.L.Zola (NASA Lewis Res. Centre, Cleveland, OH, USA).

AIAA J. (USA), vol.21, no.3, p.336-42 (March 1983).

A semiempirical model for predicting the noise generated by conventional velocity-profile jets exhausting from coaxial nozzles is presented and compared with small-scale static data. The present method is an updated version

of that part of the original NASA Aircraft Noise Prediction Program (1974) relating to coaxial jet noise. The new procedure is more theoretically based and has also been improved by some empirical adjustments. (13 refs.)

61535 Inviscid axisymmetric jet impingement with recirculating stagnation regions. A.Rubel (Grumman Aerospace Corp., Bethpage, NY, USA). *AIAA J. (USA)*, vol.21, no.3, p.351-7 (March 1983).

Numerical solutions for the normal impingement of inviscid axisymmetric jets with energy deficient cores reveal three distinct classes of behaviour: (1) a small defect regime where the flow structure is unchanged from the zero defect case; (2) a moderate defect regime where stagnation bubbles first appear and grow with increased defect; and (3) a strong defect regime, where no solutions have been found. The recirculation zone model presumes that vorticity over radius is constant and continuous across the dividing stream surface. A local analytic solution to the governing partial differential equation for the stagnation bubble is consistent with the computational results. (14 refs.)

61536 Axially symmetric jet flows. H.W.Alt (Univ. of Heidelberg, Heidelberg, Germany), L.A.Caffarelli, A.Friedman. *Arch. Ration. Mech. & Anal. (Germany)*, vol.81, no.2, p.97-149 (1983).

The authors establish a general existence and uniqueness theorem for three dimensional axially symmetric jet flow. The results also apply (with trivial changes) to symmetric two dimensional jet flows and provide far reaching generalisations of the known existence theorems. (19 refs.)

61537 Joint probability density distribution in a radial axisymmetric plane wall jet. D.Codazzi, C.Kopp, R.Teitgen, H.Burnage (Univ. Louis-Pasteur de Strasbourg, Strasbourg, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.1, p.15-17 (10 Jan. 1983). In French.

Joint probability density distributions computed in the outer self-preserved region of a turbulent plane radial axisymmetric wall jet are presented. This method shows that the fluctuating velocity vector has a preferred direction which appears to be different from its mean orientation. Hence, the most probable value (MPV) of the fluctuating velocity vector is not zero. The pattern of the MPV velocity vectors is given. Conditional sampling techniques lead to the following result: the MPV vector pattern which can be considered as MPV streamlines appears to be statistically stable. (5 refs.)

61538 A study of the fluctuation concentration field in a turbulent jet. On the measurement of the concentration fluctuation intensity and the self-preservation. I.Nakamura, Y.Sakai (Dept. of Mech. Engng., Nagoya Univ., Nagoya, Japan), M.Miyata.

Mem. Fac. Eng. Nagoya Univ. (Japan), vol.34, no.1, p.113-24 (May 1982). In English. [received: March 1983]

Experimental results on the diffusion process, in a circular jet of a dye solution issuing into a quiescent water are presented. Also a semi-empirical theory for the radial profile of the concentration field for a dye solution were performed by a light absorption method because of the simplicity of its measuring principle and movability of the probe. Experimental results showed that the radial profiles of the mean axial velocity and mean concentration respectively had well-known Gaussian distributions. A self-preserving form for the profiles of the concentration fluctuation intensity was observed in the downstream region, $x/d_0 \geq 100$. Using these experimental results and assumptions on the gradient type diffusion process, an analysis and calculations are presented on the self-preserving profile of the concentration fluctuation intensity. (14 refs.)

61539 The pressure distribution on an arbitrary oriented plane impinged by a strongly underexpanded jet of rarefied gas. B.F.Panov. *Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR)*, no.1, p.74-80 (Jan. 1983). In Russian.

The results of experimental research into the pressure distribution of an arbitrary plane exposed to rarefied air jet from a sonic nozzle are presented. A method of calculating the pressure on a surface is proposed and empirical formulae are suggested. (12 refs.)

Turbulence measurements in wall jets along strongly concave surfaces See Entry 61490

47.55E Nozzles

61540 Theoretical and experimental studies on the formation of an air core in a swirl spray pressure nozzle using a power law non-Newtonian liquid. S.K.Som (Dept. of Mech. Engng., Indian Inst. of Technol., Kharagpur, India). *Appl. Sci. Res. (Netherlands)*, vol.40, no.1, p.71-91 (1983).

An extension of the recent work (see Som and Mukherjee, 1980) has been made to evaluate the air core diameter both theoretically and experimentally in the case of a swirl nozzle using a time independent pure viscous power law non-Newtonian fluid. The theoretical predictions have been made through an approximated analytical solution of the hydrodynamics of flow inside the nozzle. A series of experiments has been carried out with solutions of CMC (carboxymethyl cellulose sodium salt) powder in water with different concentrations as the working fluids. The rheological properties of the working fluids were measured by a capillary tube viscometer. Finally it has been recognised from both the theory and experiment that, regarding the injection condition and the fluid properties, the generalised Reynolds number $Re_{G(0)}$ at the inlet to the nozzle and the flow behaviour index n of the fluid become the pertinent independent input parameters in non-dimensional forms. The air core diameter increased with $Re_{G(0)}$ and decreases with n . The effect of nozzle geometry on the air core diameter is similar to that in the case of Newtonian fluids. (19 refs.)

Conventional profile coaxial jet noise prediction See Entry 61534

The pressure distribution on an arbitrary oriented plane impinged by a strongly underexpanded jet of rarefied gas See Entry 61539

47.55H Stratified flows

61541 The effect of nonlinear density stratification on the stability of a vertical water layer in the conduction regime. A.H.Shaaban, M.N.Ozizik (Dept. of Mech. & Aerospace Engng., North Carolina state Univ., Raleigh, NC, USA).

Trans. ASME, J. Heat Transfer (USA), vol.105, no.1, p.130-7 (Feb. 1983). The thermal stability of a layer of water between two vertical parallel plates maintained at different temperatures, T_1 and T_2 , is investigated for the conduction regime. Three cases are considered include where: (a) the maximum density layer is within the water region; (b) is at the boundary; and (c) is outside the water region. Cubic polynomials are used to represent the density-temperature relation in the temperature range 0-55°C. The numerical results show that the critical states of stability do not depend on Prandtl

number but instead depends on the combinations of T_1 and T_2 . Of the three cases considered, the first case is the most unstable. In all three cases, the instabilities set in as a traveling wave, moving against gravity, for most T_1 and T_2 combinations. Stationary waves were also found for case (c). (19 refs.)

Stratification instability of switching front in an active trigger diffusive medium See Entry 61487

47.55K Multiphase flows

61542 Experimental determination of velocity statistical distributions in suspension flows. B.Oesterle (Univ. de Nancy-I, Nancy, Vandoeuvre, France).

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.1, p.9-14 (10 Jan. 1983). In French.

An experimental method for statistical study of particle velocities in a suspension flow is described. Velocities are measured by laser anemometry, a plot of velocity histogram being obtained by a microprocessor circuit. Care must be taken in the exploitation of these histograms, to derive the corresponding probability densities curves. Examples of results are given in the case of a gas-solid horizontal pipe flow. (8 refs.)

61543 Compression of a spherical gas bubble in ideal liquid by the finite pressure-pulse. W.Trzcinski, E.Wlodarczyk. *J. Tech. Phys. (Poland)*, vol.22, no.4, p.429-42 (1981).

A rigorous solution is given to the problem of compression of a gas bubble immersed in an incompressible ideal liquid subjected to external pressure varying in time. In particular, the case is analysed where the short-lived pressure-pulse in the liquid at infinity has the form of a rectangle. (9 refs.)

61544 Sheared colloidal suspensions. B.J.Ackerson (Dept. of Phys., Oklahoma State Univ., Stillwater, OK, USA), N.A.Clark. *Physica A (Netherlands)*, vol.118A, no.1-3, p.221-49 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

The structure of aqueous suspensions of electrostatically interacting submicron polymer spheres is studied as a function of shear. These model colloidal suspensions exhibit a variety of equilibrium and nonequilibrium structures and phase transitions. Both shear induced melting of solid-like structures and shear induced distortion of liquid-like structures are observed. Several models are presented to explain the observed effects. The analogy between these colloidal suspensions and pure fluid systems is discussed. (70 refs.)

61545 Axisymmetric flow of a dusty gas between two contracting or distending discs. E.Chandrasekharan, G.Ramanaiah (Faculty of Sci., Madras Inst. of Technol., Madras, India).

Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.1, p.21-32 (Jan.-Feb. 1983).

The axisymmetric flow of an incompressible viscous dusty fluid between two parallel contracting/distending discs is investigated, when the dust particles are assumed to move with a small velocity as compared with that of the fluid. Using a similarity solution technique numerical solutions are obtained for the instantaneous velocities of the fluid and dust particles. Also the streamlines for the fluid and dust particles, the pressure distribution between the discs and the stress on the discs are determined and in each case the results are compared with those of the clean fluid. Further, it is found that along the axial direction the dust particles have a tendency to move towards the mid-region between the two discs. (10 refs.)

47.55M Flow through porous media

61546 Vapor flow through a porous membrane—a throttling process with condensation and evaporation. W.Schneider (Tech. Univ. Wien, Wien, Austria).

Acta Mech. (Austria), vol.47, no.1-2, p.15-25 (1983).

The one-dimensional flow of a vapor through a porous membrane is considered. Upstream the membrane the vapor is assumed to be in a state of saturation, downstream the membrane there may be superheated vapor, saturated vapor or a two-phase mixture. It is shown that heat conduction in flow direction is important if the Joule-Kelvin coefficient of the vapor is positive and the permeability of the membrane is sufficiently small. This results in condensation at the front surface of the membrane, liquid flow in the membrane or part of it, and re-evaporation at the rear surface or in an evaporation front in the interior of the membrane. If the permeability of the membrane is below a critical value that depends on thermodynamic quantities only, the energy balance requires the formation of a condensate film in front of the membrane. Four possible types of throttling processes are analyzed for small pressure variations and an equation for the mass flow rate in terms of the pressure difference across the membrane is given. The predicted mass flow rate of isobutane through a microporous polypropylene membrane compares favourably with measurements. (13 refs.)

61547 Oxygen mass transfer in three-phase fluidized beds working at large flow rates. M.Alvarez-Cuenca, C.G.J.Baker, M.A.Bergougnou, M.A.Nerenberg (Faculty of Engng. Sci., Univ. of Western Ontario, London, Ontario, Canada).

Can. J. Chem. Eng. (Canada), vol.61, no.1, p.58-63 (Feb. 1983). The published literature on gas mass transfer in three-phase fluidized beds indicates that most of the research done in the last two decades has been carried out at low superficial velocities and/or volumetric flow rates. These experimental limitations are reflected in the current understanding of these systems. In this investigation, performed at large gas and liquid velocities and flow rates, the behaviour of three-phase fluidized beds of 0.1, 0.3 and 0.5 cm diameter glass beads has been studied. Computer-made contour diagrams, obtained from the mapping of the oxygen concentration in the column have proven to be an effective probing technique. These diagrams permit the description of flow patterns and bed hydrodynamic properties otherwise not

observable with tracers. The use of concentration and pressure profiles complements the observations made with the contour diagrams. At low gas and liquid velocities the concentration profiles are S-shaped. As V_0 and V_1 increase the three absorption zones, observed in those S-shaped profiles, become two zone similar to those observed in bubble columns. The interface between the dense bed and dilute phase is characterized by an unusually high mass transfer activity. (18 refs.)

61548 Fluidized bed expansion as a result of biomass growth. S.-C.Wang, C.Tien (Dept. of Chem. Engng. & Materials Sci., Syracuse Univ., Syracuse, NY, USA).

Can. J. Chem. Eng. (Canada), vol.61, no.1, p.64-7 (Feb. 1983).

A relationship which is capable of predicting the height of a fluidized bed with the extent of the biomass growth at the surface of the fluidized particles is proposed. The application of this relationship for the determination of one of the biological parameters of waste water treatment is demonstrated. (8 refs.)

61549 Monte Carlo simulation of diffusion of gases in a porous solid: calculations for a new class of solids. Y.Nakano, J.W.Evans (Dept. of Materials Sci. & Mineral Engng., Univ. of California, Berkeley, CA, USA).

J. Chem. Phys. (USA), vol.78, no.5, p.2568-72 (1 March 1983).

In a previous paper, a Monte Carlo simulation of the Knudsen diffusion of a gas in a porous solid was carried out. The simulated porous solid had pore walls that were convex. In the present paper, the simulation is repeated using simulated solids whose pore walls are concave. It was found that the results of both studies could be correlated by a single equation. This equation enables the prediction of the Knudsen diffusivity from the porosity and mean pore size without resort to a tortuosity factor. (5 refs.)

61550 General problems of motion in a homogeneous porous medium exhibiting cavities. S.Gogonea.

Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Romania), vol.27, no.4, p.467-86 (July-Aug. 1982). In French. [received: March 1983]

Mathematical analysis is applied to a porous environment with an arbitrary number of cavities and impermeable inclusions while the fluid is considered to be incompressible and ideal. The derived equations provide a unique solution and an example of the filtration process is provided. (5 refs.) I.G.

47.60 FLOWS IN DUCTS, CHANNELS, AND CONDUITS

(for biological fluid dynamics, see 87.45)

61551 On the propagation of non-linear pressure waves in pipes with turbulent non-zero mean flow. A.Kluwick, N.Stross (Tech. Univ. Wien, Wien, Austria).

Acta Mech. (Austria), vol.47, no.1-2, p.73-86 (1983).

Deals with the propagation of small-amplitude finite-rate waves in gas filled pipes with non zero mean flow. Adopting the assumption of quasi-one-dimensional flow it is shown that the wave motion can be studied analytically provided the characteristic wave length is sufficiently small. The combined effects of stratification non-linearity and frictional attenuation are discussed in detail for left-running and right-running waves. (7 refs.)

61552 Approach flow direction effects on the cross-flow induced vibrations of a square array of tubes. D.S.Weaver (Dept. of Mech. Engng., McMaster Univ., Hamilton, Ontario, Canada), H.C.Yeung.

J. Sound & Vib. (GB), vol.87, no.3, p.469-82 (8 April 1983).

Water tunnel experiments were conducted on a square array of tubes with a pitch ratio of 1.5. The array could be rotated about an axis perpendicular to the direction of flow so that the effects of incident flow direction on cross-flow tube response could be studied. Constant Strouhal number vorticity response was observed over a range of orientations with some Strouhal number dependence on orientation angle. While incident flow direction was found to have some effect on the fluid-elastic stability threshold, no dramatic changes, such as occurred for triangular arrays, were found. Experiments were also conducted to determine the stability behaviour of a single flexible tube in otherwise rigid arrays. (24 refs.)

61553 Some elementary exact channel flows. N.De Mestre, T.Parkes (Dept. of Math., Royal Military Coll., Duntroon, Australia).

J. Aust. Math. Soc. Ser. B (Australia), vol.24, pt.4, p.484-91 (April 1983).

New polynomial solutions of the Navier-Stokes equations for steady unidirectional flow of a viscous incompressible fluid with a free surface, down inclined channels of specialized cross-section are considered. An inverse method is used to obtain the geometrical shape of the channel by equating the polynomial solution to zero (i.e. the no-slip condition) and thence determining the boundary shape. (2 refs.)

61554 Heat transfer and fluid flow experiments with a tube fed by a plenum having nonaligned inlet and exit. E.M.Sparrow, L.D.Bosmans (Dept. of Mech. Engng., Univ. of Minnesota, Minneapolis, MN, USA).

Trans. ASME, J. Heat Transfer (USA), vol.105, no.1, p.56-63 (Feb. 1983).

Local turbulent heat transfer coefficients for airflow were measured in a tube situated downstream of a cylindrical plenum chamber in which the inflow was radial and the outflow was axial. Pressure drop measurements and flow visualization were performed to supplement the heat transfer experiments. The plenum length and diameter were varied systematically during the experiments, and the Reynolds number ranged from 10000 to 60000. Substantially higher Nusselt numbers in the tube were encountered for the present nonaligned plenum inlet/exit configuration than for a plenum with axially aligned inlet and exit or for an upstream hydrodynamic development section. For a given Reynolds number, the Nusselt numbers corresponding to the present plenum configuration were quite insensitive to the investigated geometrical parameters. The thermal development length was found to be substantially elongated due to swirl carried into the tube from the plenum; the presence of the swirl was confirmed by flow visualization. The net pressure loss due to the presence of the plenum was about 1.75 velocity heads and was quite insensitive to the geometrical parameters and to the Reynolds number. (4 refs.)

47.65 MAGNETOHYDRODYNAMICS AND ELECTROHYDRODYNAMICS

(for MHD in plasma, see 52.30)

61555 Effects of the Hall current on the stationary hydromagnetic motions of a compressible, barotropic and viscous fluid. V.Salone (Univ. di Catania, Catania, Italy).

Atti Semin. Mat. & Fis. Univ. Modena (Italy), vol.30, no.2, p.213-38 (1981). In Italian.

The conditions which stationary hydromagnetic motions, in the presence of the Hall effect, must satisfy are determined on the hypothesis that the components of the magnetic and kinetic field depend on all three space coordinates, all the other elements depending on two co-ordinate planes. The hydromagnetic motions fall into three classes according to whether their existence is limited to the MHD with or without the Hall effect, or exist in any case. The conditions which stationary, Hall-free hydromagnetic motions must satisfy are derived. (23 refs.) J.S.

61556 Deformation of bubbles in an electric field. A.Beroual (Ecole Nat. Polytech., Algiers, Algeria).

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.3, p.169-72 (24 Jan. 1983). In French.

The shape of a bubble—gas or liquid—in suspension within liquid medium and subjected to an electric field between parallel plate electrodes is discussed. It is shown that the deformation of a bubble charged or situated near the electrode is not symmetric. This dissymmetry has been verified experimentally using a fast photo camera. (4 refs.)

61557 Electrohydrodynamic stability of an insulating liquid lying between two concentric spheres and subjected to a weak unipolar injection. S.Oliveri, P.Atten (Lab. d'Electrostatique, CNRS, Grenoble, France).

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.5, p.313-16 (7 Feb. 1983). In French.

An insulating incompressible liquid lying between two concentric conducting spheres is subjected to a unipolar injection by one or the other of the two spheres. In both cases, the critical conditions for hydrodynamic stability (linear theory) is determined for the asymptotic limit of very weak injections. (7 refs.)

61558 Unsteady hydromagnetic flow of fluid with microstructure between parallel plates. N.Venkata Narayana (Dept. of Appl. Maths., Andhra Univ., Waltair, India).

Indian J. Pure & Appl. Math., vol.14, no.1, p.129-45 (Jan. 1983).

Two types of unsteady hydromagnetic flow of the fluid have been considered. (i) Initially the fluid is at rest and the motion is caused by a sudden change of pressure gradient from zero to a constant value, (ii) One plate is fixed while the other is accelerated with a velocity $v = Ut^n$ (U and n being positive constants). The flow pattern is discussed in both cases in detail. (1 ref.)

61559 The numerical and exact solutions of MHD flow through a pipe whose section is a sector. Bani Singh (Dept. of Maths., Univ. of Roorkee, Roorkee, India), Jia Lal.

Indian J. Pure & Appl. Math., vol.14, no.1, p.146-58 (Jan. 1983).

The exact and numerical solutions have been found and the results compared. Since the exact solution is not suitable for computational purposes, a fast direct method based on Hockney's technique (1965) has been used to obtain the numerical results. For this, the section is first transformed into a rectangle for which a high accuracy nine-point formula is used. The results show very good agreement with those obtained from the exact solution. Tables, graphs and reliefs are given to show the variation of velocity, induced magnetic field and flux for various Hartmann numbers. (14 refs.)

61560 Effect of Hall current on unsteady hydromagnetic boundary layers in rotating dust fluid. R.Tiwari, Kamal Singh (Dept. of Maths., Banaras Hindu Univ., Varanasi, India).

Indian J. Pure & Appl. Math., vol.14, no.1, p.159-65 (Jan. 1983).

An asymptotic analysis of the unsteady hydromagnetic boundary layer flow generated impulsively in an incompressible viscous conducting fluid with uniform distribution of dust particles bounded by a semi-infinite plate is given. It

is shown that the initial motion for small times describes the general feature of the unsteady hydromagnetic boundary layer flow and consists of two distinct boundary layers which are unaffected by dusty parameters as well as rotation and magnetic terms. In subsequent large times, the effect of dusty parameter, magnetic parameter, Ekman parameter and Hall current parameter are reflected on the solution and associated boundary layer thickness increases with increase in dusty and Hall current parameter. While at large times the steady state is reached in the limit $t \rightarrow \infty$ with $\Omega \neq 0$, $\omega = 0$. (8 refs.)

61561 The generation of electric currents by the turbulent flow of dielectric liquids. II. Pipes of finite length. H.L.Walmsley (Shell Res. Ltd., Thornton Res. Centre, Chester, England).

J. Phys. D (GB), vol.16, no.4, p.553-72 (14 April 1983).

For pt.1 see *ibid.*, vol.15, p.1907-34 (1982). A recent theory for the generation of electric currents by hydrocarbon fuels in infinitely long pipes has been modified to describe the finite pipe lengths obtained in practice. The boundary conditions used in the original model only permitted ions to be adsorbed at the wall; the authors have now extended them to allow the desorption (injection) of ions as well. The extended model has been applied to both the generation and the relaxation of charge in pipes of finite length. (9 refs.)

61562 Smooth global solutions for the one-dimensional equations magnetohydrodynamics. S.Kawashima (Dept. of Math., Nara Women's Univ., Nara, Japan), M.Okada.

Proc. Jpn. Acad. Ser. A (Japan), vol.58, no.9, p.384-7 (Nov. 1982). [received: April 1983]

The authors seek smooth solutions to Lagrangian representation equations for the motion of electrically conducting fluids on one space coordinate. (5 refs.)

61563 Hydromagnetic flow and heat transfer between two horizontal plates, the lower plate being a stretching sheet. A.K.Borkakoti, A.Bharali (Dibrugarh Univ., Dibrugarh, India).

Q. Appl. Math. (USA), vol.40, no.4, p.461-7 (Jan. 1983).

Hydromagnetic flow and heat transfer between two horizontal parallel plates, where the lower one is a stretching sheet and the upper one is a porous solid plate are studied in the presence of a transverse magnetic field. Fluid velocities and temperature distributions are obtained and plotted graphically. (5 refs.)

47.70 REACTIVE, RADIATIVE, OR NONEQUILIBRIUM FLOWS

61564 Spectral behaviour of a concentration field in turbulence environment with rapid chemical reaction. A.Bennani, J.-N.Gence, J.Mathieu (Lab. de Mecanique des Fluides, Ecole Centrale de Lyon, Ecully, France).

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.1, p.5-8 (10 Jan. 1983). In French.

A second order reaction is used in order to identify the spectral behaviour of a concentration field in turbulence environment. The role played by the Damkohler number is emphasized but the spectral shape of concentration of one of the two species A has to be examined as a function of the downstream position with respect to the injection grid generating turbulence. (5 refs.)

61565 Premixed combustion in a turbulent boundary layer with injection. S.Meunier, M.Champion, J.C.Bellet (Lab. d'Energetique et de Detonique, ENSMA, Poitiers, France).

Combust. & Flame (USA), vol.50, no.2, p.231-8 (March 1983).

The reactive flow obtained by injecting a fresh mixture of propane and air into a stream of hot gas through a porous plate is studied both theoretically and experimentally. Using mass weighted Favre averages, the authors close the system of partial differential equations through a $k-\epsilon$ model of turbulence and a probability density function of the product mass fraction. The closed set of seven mean transport equations is solved for an injection rate varying between 0 and 2%. The numerical results are compared with measurements of mean velocity, streamwise rms velocity, and mean temperature, and good agreement is shown for injection rate values up to 1%. For larger rates of injection, factors such as the transverse pressure gradient and dissipation of the turbulent kinetic energy due to heat release, not taken into account by the $k-\epsilon$ model, become important and the extent of agreement is reduced. (4 refs.)

61566 Stability of a laminar flame front propagating within a tube. G.D.Salamandra, N.I.Maiorov.

Combust. Explos. & Shock Waves (USA), vol.18, no.4, p.439-42 (July-Aug. 1982). Translation of: *Fiz. Goreniya & Vzryva (USSR)*, vol.18, no.4, p.61-4 (July-Aug. 1982). [received: March 1983]

If a perturbation is created by some noncontact method on a small portion of the flame front, cine photography can be used to trace the change on flame front form under the action of the perturbation. The difficulties connected with the limited time available for development of these perturbations are not as great as would appear at first glance. The present study will examine the deformation of a flame propagating in a semi-closed horizontal tube under the action of perturbations artificially created on the flame surface by brief action of a transverse electrical field on the combustion zone. (9 refs.)

61567 Hydrogen separation from gas mixtures using LaNi₃ pellets. P.S.Rudman, G.D.Sandrock, P.D.Goodell (Inco Res. & Dev. Center Inc., Suffern, NY, USA).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.437-46 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

Porous pellets containing the hydride-former LaNi₃ for use in an absorption bed for extracting hydrogen from gas mixtures were prepared and tested. The unique aspect of these pellets is their incorporation of thermal ballast. By this means, the thermal effects of hydriding and dehydriding are reduced to controlled temperature swings, and adiabatic operation is possible. Pellet bonding has been accomplished by: (1) sintering of a nickel powder thermal ballast; (2) the addition of silicone rubber binder; and (3) the addition of a Teflon-polyethylene binder. A flow-through reactor was designed and employed to evaluate pellet behavior in nondilute gas mixtures. A model for hydrogen

absorption from gas mixtures was developed to resolve the absorption kinetics data into the following rate-limiting factors: (1) intrinsic rate; (2) intrinsic rate retardation; (3) microflow and (intrapellet gas transport); (4) macroflow (interpellet gas transport). Flow-through absorption kinetics data are presented for the pellets in H₂-NH₃ gas mixtures. (11 refs.)

61568 Hydrogen separation from mixed gas streams using reversible metal hydrides. J.J.Sheridan, III, F.G.Eisenberg, E.J.Greskovich (Air Products & Chem. Inc., Allentown, PA, USA), G.D.Sandrock, E.L.Huston.

J. Less-Common Met. (Switzerland), vol.89, no.2, p.447-55 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

A novel hydrogen separation process utilizing the selective absorption properties of metal hydrides was developed. Performance and operational data generated during a 9 month pilot plant demonstration of the process are used to describe the important technical features of the process. When applied to the separation of the hydrogen from the argon vent stream of an ammonia synthesis loop, the process is capable of producing a final hydrogen product of minimum purity 99% at an overall recovery of 90%-93%. Unique features of the hydrogen absorbent and absorber performance are discussed. (5 refs.)

61569 Fluctuations anisotropy arising from velocity or temperature gradients. D.Beyens (Div. de la Phys., CEA, CENS, Gif-sur-Yvette, France).

Physica A (Netherlands), vol.118A, no.1-3, p.250-67 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

Fluids out of equilibrium may exhibit unusual behaviour. Thus a thermal gradient can induce long-range correlations in the sound modes, whereas a shear flow is able to suppress the large correlations occurring near a critical point. Light scattering techniques allow these different behaviors to be detected. In the first case, an asymmetry in the Brillouin lines becomes visible; in the second case a strong anisotropy in the order parameter fluctuations appears, so that mean-field theory applies. This theory should be valid at equilibrium only in a space of dimensionality higher than 4. (24 refs.)

47.75 RELATIVISTIC FLUID DYNAMICS

61570 Speed of propagation of infinitesimal disturbances in a relativistic gas. C.Cercignani (Dipartimento di Matematica, Politecnico di Milano, Milano, Italy).

Phys. Rev. Lett. (USA), vol.50, no.15, p.1122-4 (11 April 1983).

The phase speed of infinitesimal disturbances in a relativistic gas is shown to be less than the speed of light. The result is obtained by means of the kinetic theory of gases and is valid for any collision operator. The treatment applies, in particular, to the speeds of propagation of sound, shear, and heat waves. These waves are further shown to be damped. (31 refs.)

47.80 INSTRUMENTATION FOR FLUID DYNAMICS

61571 Uncertainty in flow measurements using the bell prover of the Institute of Mechanics, Cagliari. R.Vallascas.

Autom. & Strum. (Italy), vol.31, no.2, p.112-15 (Feb. 1983). In Italian.

The procedures adopted to determine the degree of uncertainty associated with the calibration curves of flowmeters calibrated by means of the bell prover of the Institute of Mechanics, Cagliari are reported upon. The effect which certain parameters, which include the sensibility threshold on starting up, have on the quantitative and qualitative characterisation of the apparatus is also underlined. (7 refs.)

61572 A microprocessor-based pulse-height analyzer. R.Hariharan, V.D.Kulkarni (Indian Inst. of Sci., Bangalore, India).

IEEE Micro (USA), vol.2, no.3, p.86-91 (Aug. 1982). [received: March 1983]

Particle size is measured by an acoustic or optical technique; an acoustic wave or a beam of light is passed through a region and is reflected from the particles in that region. This reflected energy is converted into electrical pulses by appropriate instrumentation. The amplitude of the pulses are proportional to the sizes of the particles. In order to determine the distribution of particle sizes in flow over a period of time, the pulses must be grouped into various bands according to their amplitudes. This can be accomplished by means of a microprocessor-based pulse-height analyzer developed by the authors. This system is meant for cavitation applications in hydraulic systems, where pulse amplitudes in the range of 10 mV to 1.3 V (representing particle sizes in the range of 5 to 20 micrometers) are encountered. In such applications, the pulse width is on the order of 1 to 2 μ s and the pulse repetition frequency is about 20 KHz. The system divides the 10-mV to 1.3-V range into 12 bands, with the individual band levels fixed so as not to miss any pulse of interest. It is based on Intel's 8085 A-2 central processing unit. (2 refs.)

61573 Behavior of a perturbed rarefaction wave. B.A.Klopov, E.E.Meshkov.

Combust. Explos. & Shock Waves (USA), vol.18, no.4, p.472-5 (July-Aug. 1982). Translation of: *Fiz. Goreniya & Vzryva (USSR)*, vol.18, no.4, p.96-100 (July-Aug. 1982). [received: March 1983]

Results of an experimental investigation of the behavior of a plane centered rarefaction wave which has a perturbation of the front shape at the time of origination, are described. The experiments were conducted in a shock tube of rectangular 120x40 mm section. The measuring section of the shock tube from organic glass ST-1, consisted of separate weldable blocks 1-2 assembled in a common frame. Collected, the blocks formed a channel that was a continuation of the shock tube channel. (3 refs.)

61574 Measurement of instantaneous flow rate through estimation of velocity profiles. M.Uchiyama, K.Hakomori.

IEEE Trans. Autom. Control (USA), vol.AC-28, no.3, p.380-8 (March 1983).

It is very important, but difficult to measure instantaneous flow rate in the unsteady flow regime, since the variation of velocity profile limits the dynamic accuracy of flowmeters. Consideration of the velocity profile variation is crucial to improving their dynamic performance. The paper presents a new method of measuring the instantaneous flow rate of unsteady flow in a circular pipe by estimating the velocity profile of the flow. The estimation is formulated as a discrete Kalman filter problem where the dynamics of the

velocity profile, which is governed by a linear partial differential equation, is approximated using a finite-dimensional model. An instantaneous flowmeter consisting of a laser Doppler velocimeter (LDV) and an 8-bit microcomputer which implements the solution of the filter problem has been developed. Successful measurements of a pulsating flow and a stepwise changing flow by this flowmeter are presented. (8 refs.)

61575 Computation of electromagnetic flowmeter characteristics from magnetic field data. II. Errors. D.G.Wyatt (Nuffield Inst. for Medical Res., Univ. of Oxford, Oxford, England).

J. Phys. D (GB), vol.16, no.4, p.465-78 (14 April 1983).

For pt.I see M.K. Bevir et al., *ibid.*, vol.14, p.373-88 (1981). Examines the errors involved in evaluating the functions $\sum_{m=1,3,5}^{\infty} A(m,p) \int_0^{2\pi} B_m(\theta_0) \cos m\theta_0 d\theta_0$ and $\int_0^{\infty} T(\gamma,m,p) \int_0^{\infty} B_m(l) \cos \gamma l d\gamma$. $A(m,p)$ and $T(\gamma,m,p)$ tend to zero as m and γ respectively tend to ∞ . B_m is available only at specified sampling intervals in θ_0 and l . The summation in m and the integration with respect to γ are done before the integrations with respect to θ_0 and l . The functions are special examples, which are suitable for error analysis, of the expression for the axisymmetric weight function of an electromagnetic flowmeter when derived from magnetic field data (see pt.I). It is shown that the errors are generally smaller when the trapezoidal rule, rather than Simpson's rule, is used to perform the integrations with respect to θ_0 and l . It is also shown that m, γ should be limited to values related to the sampling intervals in θ_0, l respectively in order to avoid unnecessary error. B_m represents measured values of the magnetic field and the magnitude of the errors is explored for representative functions $B_m(\theta_0)$ and $B_m(l)$. The effect of the finite dimensions of the device used to measure B_m is also considered. An assessment is given of the error due to these effects in pt.I. (8 refs.)

61576 A comparison of experimental and numerical results obtained for the secondary flow in a large turbine cascade. W.N.Dawes, P.H.Richards (CEGB Marchwood Engng. Labs., Southampton, England).

J. Phys. D (GB), vol.16, no.4, p.539-51 (14 April 1983).

Laser Doppler anemometry has been used to measure the flowfield in a low-speed turbine cascade. The LDA technique successfully resolves the secondary velocity components associated with the formation of a strong passage vortex embedded in the blade suction-surface-endwall corner. The measured results are compared with numerical calculations made using a fully three-dimensional time-marching method which solves the inviscid equations of fluid motion. It is shown that good agreement could be achieved between the computations and the measurements, but only after ad hoc adjustment of the numerical viscosity terms. Nevertheless, it is suggested that until methods solving the viscous equations of motion are readily available, use of inviscid methods may provide a satisfactory approximation. (13 refs.)

61577 Viscosity measurement. II. P.J.Tily (Dept. of Industry, Warren Spring Lab., Stevenage, England).

Meas. & Control (GB), vol.16, no.4, p.137-9 (April 1983).

For pt.I see *ibid.*, vol.16, no.3, p.111 (1983). Looks at the types of process viscometers available and their applications, the importance of shear rate in viscosity measurement, and the process control application. (21 refs.)

61578 On-line analytical instrumentation in the water industry—problems and practical solutions. II. Potential solutions. R.Briggs.

Meas. & Control (GB), vol.16, no.4, p.151-5 (April 1983).

For pt.I see *ibid.*, vol.18, no.3, p.94-7 (1983). This part is concerned with relevant advances in some areas of sensor development, with organisational and logistical aspects, and with the consideration of 'new horizons' which may ultimately lead to significant and relevant advances in the required instrumentation. (20 refs.)

61579 Modern flow measurement. O.Fiedler (Sektion Tech. Elektronik, Wilhelm-Pieck-Univ., Rostock, Germany).

MSR (Mess. Steuern Regeln) (Germany), vol.26, no.3, p.122-8 (March 1983). In German.

Flow measurement transmitters are important for the simulation and automation of flow processes in gases and liquids. Besides hot-wire probes and actual pressure gauges, noncontacting methods and probes used more and more. Developments and applications of acoustical, optical and inductive flow meters are presented in connection with electronic measurement value acquisition, and explained by means of examples. (21 refs.)

61580 Pressure gauges and inclinometers listing magnetic liquids. O.Fiedler, R.Jaskulke (Sektion Tech. Elektronik, Wilhelm-Pieck-Univ., Rostock, Germany).

MSR (Mess. Steuern Regeln) (Germany), vol.26, no.3, p.129-31 (March 1983). In German.

The authors present solutions for the realization of measurement transmitters based upon the functions principle of simple U-pipe devices for pressure, flow and inclination angle measurement. The use of magnetic liquids as medium in such apparatus allows a simple change over to electrical measurement value acquisition. The measurement methods are characterized by simple construction, high sensitivity and linear measurement value conversion. (no refs.)

61581 LDA measurement equipment for serial multi-component measurement with microcomputer-coupled period meter. W.Kroger, H.E.Albrecht, W.Fuchs (Sektion Tech. Elektronik, Wilhelm Pieck Univ., Rostock, Germany).

MSR (Mess. Steuern Regeln) (Germany), vol.26, no.3, p.134-40 (March 1983). In German.

The authors describe a flow velocity measurement equipment for hydrodynamical measurement problems based on laser Doppler anemometry. They present the system component optics, signal detection and signal processing and give hints for dimensioning. As for the signal evaluation, a new developed period measurement method is used for in connection with a K1510 microcomputer. (16 refs.)

61582 Measurements of a supersonic velocity in a nitrogen flow using inverse Raman spectroscopy. G.C.Herring, S.A.Lee, C.Y.She (Dept. of Phys., Colorado State Univ., Fort Collins, CO, USA).

Opt. Lett. (USA), vol.8, no.4, p.214-16 (April 1983).

Results of supersonic molecular flow-velocity measurements using inverse Raman spectroscopy are reported for the first time to the authors' knowledge. Because of potential wind-tunnel applications, flowing N_2 molecules are probed directly, and their flow velocity, temperature, and density are measured. The uncertainties are less than 5% for the velocity measurements and about 10% for the temperature and density measurements. To achieve the quoted precision, I_2 fluorescence, I_2 saturated-absorption, and differential-detection techniques are used to stabilize the probe laser, provide an absolute-frequency reference and reduce detection noise, respectively. (6 refs.)

61583 A measurement method for the slippage of fluid flowing over the wall in a circular pipe. N.Kojima (Faculty of Engng., Meiji Univ., Kawasaki, Japan).

Trans. Soc. Instrum. & Control Eng. (Japan), vol.19, no.1, p.41-7 (Jan. 1983). In Japanese.

The author deals with a useful method for slippage measurement and the slippage effects on flow velocity distribution in a circular pipe. The main

merit of the method is to be able to obtain the amount of slippage from the pipe radius, the flow rate and the maximum flow velocity, independent of the pressure difference or the fluid viscosity. A slippage index number, which is obtained by the ratio of the slippage coefficient to the square of hydraulic mean depth, is proposed. When water flows in a circular pipe, the variation of the slippage coefficient is experimentally observed for changes of the pipe radii even if inside surface conditions of pipes are the same, but the slippage index number does not vary and remains constant. Therefore, the usage of the slippage index number is very convenient for obtaining generalized slippage. (3 refs.)

61584 Elektronische Einrichtungen als Teile von Messgeräten zur Mengemessung von Fluiden (Electronic systems as a part of a measurement device for flow measurement of fluids). D.Mencke.

Report PTB-Me-40, Phys.-Tech. Bundesanstalt, Braunschweig, Germany (Dec. 1982), 14 pp. In German.

The author explains that quantities of fluid can either be measured at rest in a container or while flowing through a pipe. By means of tables he details the various types of fluids which require to be metered, gives examples of the tests to which they are usually subjected, mentions the various principles of measurement used and indicates the data which require to be measured. The metered signals are then classified in six groups: quantities measured without any electronic equipment; electrical voltages, currents and resistances; frequencies; times and periods of time; numbers of pulses or other events; and, finally, integers. In the last five groups the signals to be measured can be classified as being measured by analogue, incremental and coded methods. The general requirements on the construction of calibrated electronic equipment are discussed in detail and include: the specifications for any transmission line; the error limits; the increments or decrements to be indicated for discontinuous displays; the pulse rate for flying start and stop tests; the effects of influential factors and of external interference; the necessary data that must be provided on any metering equipment; this last matter is treated under various categories. A table and its appendix explain clearly how the construction of the metering equipment must depend on the signal to be measured and the stage over which it has to be transmitted. (5 refs.) G.W.

61585 Determination of refractivity virial coefficients of CH_4 at 25°C. G.Montixi, R.Coulon (Faculte des Sci. et Tech. de Saint-Jerome, Marseille, France).

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.2, p.135-8 (17 Jan. 1983). In French.

A method is presented of direct measurement of the absolute refractive index of a gas vs. pressure, and the calculation of the first three refractivity virial coefficients. (12 refs.)

61586 Gas-phase transient diffusion in droplet vaporization and combustion. M.Matalon (Dept. of Engng. Sci. & Appl. Math., Northwestern Univ., Evanston, IL, USA), C.K.Law.

Combust. & Flame (USA), vol.50, no.2, p.219-29 (March 1983).

By suppressing the relaxation process of fuel vapor accumulation through the use of d^2 -law results as the initial conditions, the present study isolates gas-phase transient diffusion as the only transient process during droplet vaporization and combustion, and thereby successfully identifies its influence on the bulk droplet gasification characteristics. The cases of pure vaporization and flame sheet combustion are analytically solved using perturbation methods and the matched asymptotic expansion technique in the limit of the small gas-to-liquid density ratio. Results demonstrate that transient diffusion enhances the vaporization and burning rates, reduces the flame front standoff ratio, and elevates the flame temperature. However, contrary to predictions of previous studies which have inadvertently included fuel vapor accumulation; these transient diffusion effects are very small so that gas-phase quasi steadiness is indeed an adequate and useful assumption for the modeling of subcritical droplet combustion. (12 refs.)

61587 Classical S-matrix theory of viscomagnetic production cross section. Wing-Ki Liu (Dept. of Phys., Univ. of Waterloo, Waterloo, Ontario, Canada).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.175-80 (1 April 1983). The semiclassical theory of Marcus (1972) and Miller (1974) is applied to obtain an expression for the production cross section in the shear viscosity

Senftleben-Beenakker effect, whose exact expression has been recently obtained by Liu et al. (1979). The result involves a multi-dimensional integral over a function of their orientation angles between the initial orbital angular momentum and the final rotational angular momentum, and in principle can be evaluated by a Monte Carlo procedure through the computation of classical trajectories. (21 refs.)

61588 Kinetic and hydrodynamic theories of nonequilibrium fluctuations. M.C. Marchetti, J.W. Dufty (Dept. of Phys., Univ. of Florida, Gainesville, FL, USA).

Physica A (Netherlands), vol.118A, no.1-3, p.205-16 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

A unified formulation of both transport and fluctuations in a low density nonequilibrium gas is described. The method is based on an analysis of a generating functional for fluctuations of the single particle phase space density. It is shown that the first functional derivative obeys an inhomogeneous nonlinear Boltzmann equation, from which the dynamics of multi-space and -time fluctuations may be obtained by suitable functional differentiation. In particular, the equations for two-time and equal time fluctuations are obtained to illustrate the method. In this way, the description of nonequilibrium fluctuations in a low density gas input on the same theoretical basis as the usual Boltzmann kinetic theory. A hydrodynamic theory of fluctuations also may be derived from the kinetic theory; the procedure and results are indicated. (11 refs.)

61589 Gas with a nonMaxwellian velocity distribution. R.McFee (Dept. of Electrical Engng., Syracuse Univ., Syracuse, NY, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2233-6 (April 1983). The velocity distribution of a monatomic gas in a very strong magnetic field (e.g., 10^5 T) is computed two ways: with classical statistical mechanics and with rarefied-gas kinetic theory. The same nonMaxwellian distribution is found in both cases. This anomaly arises from the saturation of the electrical polarization of the atoms by the enormous electric fields which they see when moving. (7 refs.)

61590 Simplified kinetic models for relaxation of a gas with internal structure. G.V. Dubrovskii (A.A. Zhdanov State Univ., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1184-90 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1927-37 (Oct. 1982). [received: April 1983] Simplified models for the kinetic behavior of a gas consisting of particles with internal structure are considered in a general theoretical framework. Approximate relaxation equations are derived, the zeroth approximation for the distribution function in the Chapman-Enskog method is found, and the behavior of the dimensionless parameters and parameter ratios is analyzed. Approximate effective scattering T -operators are introduced which greatly simplify the calculation of inelastic cross sections in gases. Model treatments of the collision integrals are discussed. The diffusion approximation is derived for the relaxation equations for continuum scattering, generalizing previous results to the case when exchange is not assumed to involve equal numbers of photons and relaxation occurs over discrete levels (not treated in the standard diffusion model). The arguments used are important in constructing more specialized collision and relaxation models in molecular gas kinetic theory starting from the actual laws governing particle interactions. (17 refs.)

61591 Fluctuation-dissipation relations in the scattering problem and the method of fluctuations in the kinetic theory of gases. Yu.L. Klimontovich.

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.434-5 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.1005-9 (Aug. 1982). [received: April 1983] The lack of a common method for simultaneously taking into account both the strong and the weak collective interactions of the particles complicates the solution of several fundamental problems of kinetic theory, e.g. that of constructing a kinetic theory of a partially ionized plasma. The solution of this problem requires deriving a fluctuational method for evaluating the Boltzmann collision integral in the kinetic theory of gases. This approach also generates some new fluctuation-dissipation relations (more general than those in the Callen-Welton theory), which are typical of the scattering problem. These new relations can in turn be derived from the most general fluctuation-dissipation relations for many-particle distribution functions. (6 refs.)

51.20 VISCOSITY AND DIFFUSION: EXPERIMENTAL

61592 Capacity ratios and diffusion coefficients of low-volatile organic compounds in supercritical carbon dioxide from supercritical fluid chromatography (SFC). A. Wilsch, R. Feist, G.M. Schneider (Dept. of Chem., Univ. of Bochum, Bochum, Germany).

Fluid Phase Equilibria (Netherlands), vol.10, no.2-3, p.299-306 (March 1983). (Supercritical Fluids. Their Chemistry and Application, Cambridge, England, 13-15 Sept. 1982).

Capacity ratios k have been determined for phenyl myristate, phenyl palmitate and phenyl stearate from supercritical fluid chromatography (SFC) at 35 to 56°C and 85 to 190 bar using supercritical CO_2 as mobile phase and Perisorb A and Perisorb RP8 as stationary phases. For the esters used a rise in pressure from 90 to 190 bar produces a drop of k by about two orders of magnitude giving evidence of the rapidly increasing solvent power of supercritical CO_2 with increasing density. At a constant CO_2 density, k decreases with increasing temperature. The separation of the esters was found to be the better the lower the pressure was. An apparatus for the chromatographic determination of binary diffusion coefficients in supercritical gases is described. D_{12} values for some organic compounds in carbon dioxide at 40°C and in the pressure range from 80 to 160 bar are presented. With an improved electronic flow regulator an overall precision of the D_{12} values of $\pm 3\%$ is obtained. (11 refs.)

61593 Direct measurements of aerosol diffusion constants in the intermediate Knudsen regime. G.B. King, C.M. Sorensen, T.W. Lester, J.F. Merklin (Dept. of Nuclear Engng. & Phys., Kansas State Univ., Manhattan, KS, USA).

Phys. Rev. Lett. (USA), vol.50, no.15, p.1125-8 (11 April 1983). The authors have measured the diffusion constants of aerosols whose size compares to the mean free path of the gas in three different aerosols. The

experimental diffusion constants do not agree with the kinetic-theory calculations in this intermediate Knudsen regime. (17 refs.)

61594 Asymptotic time behavior of the velocity autocorrelation function. W. Schommers (Kernforschungszentrum Karlsruhe, Inst. für Angewandte Kernphys., Karlsruhe, Germany).

Phys. Rev. A (USA), vol.27, no.4, p.2241-4 (April 1983). The asymptotic time behavior of the velocity autocorrelation function has been investigated by means of molecular dynamics with and without the presence of three-body forces, respectively. It turned out that the long-time tail is strongly influenced by three-body forces. The famous $t^{-3/2}$ law has been observed in the calculation with the presence of three-body forces. (20 refs.)

51.30 THERMAL PROPERTIES OF GASES

61595 Ignition of a gas by a hot horizontal cylinder. E.P. Kostogorov, E.A. Shtessel.

Combust. Explos. & Shock Waves (USA), vol.18, no.4, p.392-6 (July-Aug. 1982). Translation of: *Fiz. Goreniya & Vzryva (USSR)*, vol.18, no.4, p.11-16 (July-Aug. 1982). [received: March 1983]

Discusses the joint solution of the equations describing the ignition process and the equations of motion. The authors consider the problem of the ignition of a chemically reacting gas by a cylindrical body in the presence of natural convection. (4 refs.)

61596 Thermal conductivity of polyatomic gases at low density. G.C. Maitland, M. Mustafa, W.A. Wakeham (Dept. of Chem. Engng. & Chem. Technol., Imperial Coll., London, England).

J. Chem. Soc. Faraday Trans. 1 (GB), vol.79, no.1, p.163-72 (Jan. 1983). The authors present a critical examination of the kinetic theory of dilute polyatomic gases using accurate data for their transport coefficients which have recently become available. Particular attention is concentrated upon the role of inelastic collision processes in the relationship between the thermal conductivity and viscosity of the polyatomic gases H_2 , D_2 , N_2 , CO , CO_2 , N_2O , CH_4 , C_2H_4 and C_2H_6 . The thermal conductivity coefficient calculated from the viscosity coefficient with the aid of the most sophisticated kinetic-theory formulae currently available deviates from the experimental data by as much as 15%. These deviations are principally attributed to the neglect of inelastic collision effects which implicitly enter the kinetic-theory formulation and which have traditionally been ignored. (28 refs.)

61597 Natural convection correlations for vertical surfaces including influences of variable properties. A.M. Clausing (Dept. of Mech. & Industrial Engng., Univ. of Illinois, Urbana, IL, USA).

Trans. ASME, J. Heat Transfer (USA), vol.105, no.1, p.138-43 (Feb. 1983). New correlations are presented for natural convective heat transfer from vertical isothermal surfaces in gases. The influences of variable properties are accounted for by using empirical equations which are of the general form $\text{Nu} = g(\text{Ra})f(\text{Ra}, T_w/T_\infty)$. The influence of the reference temperature at which the thermal properties are evaluated is also established. Comparisons with available data are made over a Rayleigh number range $10^4 < \text{Ra} < 10^{12}$ and a range in the surface-to-ambient temperature ratio of $1 < T_w/T_\infty < 2.6$. Five data sets, which represent over 200 test points, are examined. (14 refs.)

61598 Electron drift velocities in gas mixtures of He, N_2 , and CO_2 . M.C. Cornell, I.M. Littlewood, H.L. Brooks, K.J. Nygaard (Dept. of Phys., Univ. of Missouri-Rolla, Rolla, MO, USA).

J. Appl. Phys. (USA), vol.54, no.4, p.1723-4 (April 1983). An electron swarm experiment has been used to obtain electron drift velocities in the $\text{He:CO}_2:\text{N}_2$ mixtures 0:1:1, 3:1:2, and 3:1:1. The E/N range of 3 to 57 Td was studied with total gas pressure varied from 50 to 200 Torr. These particular mixtures have not been previously studied experimentally. Good agreement is observed between theoretical calculations and experimental data. (4 refs.)

61599 Calculations of drift velocity of electrons in inert gases at low E/N . M. Hayashi (Nagoya Inst. of Technol., Nagoya, Japan), S. Ushiroda.

J. Chem. Phys. (USA), vol.78, no.5, p.2621-5 (1 March 1983). The zero field reduced mobilities of electrons μ_0 in helium, neon, argon, krypton, and xenon have been calculated as a function of gas temperatures T using the Boltzmann equation and compared with the values of the thermal electron mobilities of electrons μ_N obtained by Mozumder (ibid., vol.72, p.6289, 1980). Discussion has been made about the large discrepancies between the measured and calculated values of μ_N in neon which were pointed out by Mozumder. The calculated exact drift velocities W in helium as a function of E/N and T have been compared with the experimental results of W for wide E/N and T ranges. A summarized figure is shown for anomalous electron mobilities in helium as a function of N at low E/N . (16 refs.)

61600 Ionization-superheating mechanism in current channel formation in molecular gases. K.N.Ul'yanov, V.V.Chulkov (V.I. Lenin All-Union Electrotech. Inst., Moscow, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1200-3 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1953-8 (Oct. 1982). [received: April 1983]
Equations are derived for the rate of spreading of a conducting channel in an externally maintained glow discharge in an ambient gas with nonsteady temperature for fixed geometric channel dimensions. Two cases are considered corresponding to predominantly self-sustaining ionization and predominantly externally induced ionization in the region ahead of the channel. The calculated rate of channel spreading is in agreement with the experimentally measured rate. (10 refs.)

61601 Mass spectroscopic study of precursors in a nitrogen-filled electrical shock tube. Yu.I.Chutov, V.N.Podolskii, V.Yu.Palkin (T.G. Shevchenko State Univ., Kiev, Ukrainian SSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1212-15 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1972-8 (Oct. 1982). [received: April 1983]
A modified MKh-7301 mass spectrometer is used to study the ionic composition precursors in a small electric shock tube (diameter 1.7 cm and length $l \sim 50$ cm) filled with nitrogen at pressures 0.2-1.2 torr. The electron density and temperature in the foreshock were measured using a cylindrical tungsten probe. The ions N^+ , N_2^+ , and N_3^+ were detected and their relative densities determined. The precursor was found to propagate by diffusion. A simplified scheme is proposed for handling the main ionization processes occurring in the precursor, including light diffusion, formation of highly excited molecules, and subsequent ionization of the latter in collisions with neutral and excited molecules. 61602 Faraday and Cotton-Mouton effects in gases in the presence of a strong light field. G.G.Adonts, S.G.Pilyan. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.67-9 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.114-17 (July 1982). [received: April 1983]
The change in polarization of a probe light signal propagating through a resonance medium in the presence of a constant magnetic field and a strong light field is investigated theoretically. Both the longitudinal as well as the transverse propagation of light relative to the direction of the magnetic field (nonlinear Faraday and Cotton-Mouton effects) are considered. Formulas for the refractive indices of the different polarization components of the probe light signal are found exactly in terms of the strong light field. It is shown that the presence of interference magnetic-light-induced rotation of the plane of polarization allows the local value of magnetic field, spatially inhomogeneous in magnitude, to be determined. This can be applied in plasma diagnostics and spectroscopic investigations. (6 refs.)

61603 Gas breakdown near metal surfaces caused by ultraviolet laser light. A.M.Popov (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1293-4 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2105-6 (Oct. 1982). [received: April 1983]
A possible mechanism is described for breakdown in metal vapor caused by UV light. It is shown that since the photon energy in excimer lasers is several electron volts, electron multiplication can occur via ionization of metal atoms from excited levels. (7 refs.)

61606 Second-order collisions between slow electrons and metastable krypton atoms in the 3P_2 state. G.A.Agaonova, N.B.Kolokolov, O.G.Toronov. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.117-18 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.196-8 (Aug. 1982). [received: April 1983]

Measurement of the rapid part of the energy distribution function of electrons in the plasma of the afterglow of krypton was used to determine the absolute value of the rate constant β_2 for the reaction $Kr(^3P_2) + e \rightarrow Kr(^1S_0) + e$ in the range of electronic temperature $580 \leq T_e \leq 1200$ K. This process may play an important role in the disappearance of the metastable atoms and in the energy balance of the electrons. (11 refs.)

61607 Measurements of collisional excitation rate coefficients for Fe X ions in a plasma. Jieh-shan Wang, H.R.Griem (Lab. for Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA). *Phys. Rev. A (USA)*, vol.27, no.4, p.2249-53 (April 1983).
About 1% or more of iron was introduced into a hydrogen-filled theta pinch by a gun-injection method. The Fe X density in the plasma was determined from the measured intensity of the Fe X forbidden (coronal) line at 6374.5 Å. Electron collisional excitation rate coefficients for Fe X were obtained from measurements of Fe X vacuum-ultraviolet line intensities, electron density and temperature, and Fe X density. The experimental rate coefficients are compared with theoretical results. (13 refs.)

61608 Resonant transfer and excitation (RTE) in ion-atom collisions and dielectronic recombination in plasmas. D.Brandt (Dept. of Phys. & Astron. Univ. of North Carolina, Chapel Hill, NC, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1005-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

In the resonant (charge) transfer and excitation (RTE) process, resonance states in the charge changed projectile are formed due to Coulomb-interaction with the target electrons. The calculated RTE cross section is proportional to the cross section for dielectronic recombination and its projectile energy dependence reflects the momentum distribution of the target electrons. Sample calculations for K X-ray production in S^{13+} and Ar collisions are discussed. An estimate of the experimental background indicates that RTE is more pronounced for heavy projectiles and light targets. (12 refs.)

61609 A classical path calculation of Stark broadening of isolated ion lines by plasmas. J.D.Hey, P.Breger (Dept. of Phys., Univ. of Cape Town, Rondebosch, S Africa).
S. Afr. J. Phys. (S. Africa), vol.5, no.4, p.111-22 (1982).

The impact approximation of Baranger (1958) is applied to the calculation of the widths of isolated ion lines broadened primarily by electron perturbers in the plasma. The electron perturbers are treated as classical particles moving along hyperbolic trajectories about the radiating ions, and a formula is derived for the monopole-dipole excitation cross-section which is a continuous function of perturber energy. Validity criteria for the application of the classical-path and impact approximations are discussed in detail, in order to justify the procedure. The excitation cross-section contains two important ingredients: the effective Gaunt factor and the line strength. An expression for the first of these which is compact and readily programmable, follows from the present treatment. The line strength contains the various radiator structural factors which can play a role in determining the Stark broadening of the observed spectrum. The formalism thus has two advantages: it enables reliable and rapid computations to be carried out of Stark widths of ion spectra for astrophysical purposes, and it readily lends itself to the study of radiator structural effects such as the breakdown of LS coupling and configuration interaction. 52.25 PLASMA BASIC PROPERTIES

61610 Collisional coupling of fluctuations in plasmas. P.Uddholm (Dept. of Plasma Phys., Umea Univ., Umea, Sweden).

J. Phys. A (GB), vol.16, no.6, p.1315-30 (21 April 1983).

The transition probability function approach is extended to plasmas in which the fluctuations in the various particle species are coupled through the collisions. The collisions may be either particle conserving or particle non-conserving (chemical reactions). Particular attention is paid to the case of particle non-conserving collisions, because certain difficulties connected with the use of the fluctuation dissipation theorem then arise. This does not mean that the fluctuation dissipation theorem is erroneous, but only that the appropriate force-response pair is at best difficult to find. Such is the case for the density fluctuation spectrum. The transition probability function approach avoids this difficulty. (17 refs.)

61611 Vibrational population densities of the $A^3\Sigma_u^+$, $B^3\Pi_u$, $W^3\Delta_u$, $B^3\Sigma_u^-$, and $C^3\Pi_u$ states in nitrogen plasmas. A.Ali, P.K.Ghosh (Dept. of Chem., Indian Inst. of Technol., Kanpur, India).

J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.4, p.353-67 (April 1983).

Population densities of vibrational levels of triplet excited states have been calculated using a collisional-radiative model applicable to nitrogen gas discharges with a Maxwellian electron energy distribution. Relative contributions of various electron impact and radiative processes, including intrasystem cascade, to the total cross sections of the triplet excited states are investigated. (41 refs.)

61612 Recent development in the statistical theory of high-density plasma. S.Ichamaru (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).

Phys. Scr. (Sweden), vol.T2, no.1, p.198-205 (1982). (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Describes a density functional theory of dense plasmas leading to a systematic improvement over the hypernetted chain equations. The author then presents an analytic formula for the dielectric function of the degenerate electron liquids, which satisfies a number of self-consistency requirements and which accurately reproduces the recent Monte Carlo results as well as those of the microscopic calculations. Some problems associated with the electron-ion interactions are treated: The topics include corrections to the thermodynamic functions, the electric resistivity, the plasmon linewidth and the frequency shift. (36 refs.)

61613 Effect of trapped electrons on the wave-induced current. M.Taguchi.

Report IPPJ-620, Nagoya Univ., Japan (Jan. 1983), 22 pp.

The wave-induced current in a toroidal magnetic field is computed by use of the adjoint drift-kinetic equation for electrons. The inverse aspect ratio of a toroidal device is assumed to be small and the lowest-order terms of this ratio are retained. As the wave-absorption mechanism, the electron cyclotron damping and the electron Landau damping are considered. It is found that the induced current decreases considerably by the effect of the trapped electrons when the phase velocity of a plasma wave is low. (13 refs.)

61614 Measurement of small-scale density fluctuation in JIPP T-II plasma by millimeter and sub-millimeter wave scattering. T.Tetsuka, A.Nishizawa, T.Sakai, K.Kawahata, A.Mase, T.Tsukishima, J.Fujita.

Report IPPJ-619, Nagoya Univ., Japan (Dec. 1982), 30 pp.

The small-space density fluctuations have been studied by both millimeter (2 mm) and sub-millimeter (337 μ m) wave scattering techniques in JIPP T-II plasmas. Experiments were performed in two types of plasma: Tokamak and stellarator plasmas. In both plasmas, the density fluctuations are localised in outer region of the plasma column, and show the characteristics of the drift wave mode turbulence. The density fluctuation level is $\delta n/n_0 \approx 1-1.5\%$ around the plasma edge, and this value is inversely proportional to the mean electron density. Further, the dependence of the fluctuation level on the plasma parameters is studied and compared with the scaling law of the energy confinement time of the plasma. The diffusion coefficient estimated from the density fluctuation is about one third of the global diffusion coefficient. (22 refs.)

52.25F Transport properties

61615 Influence of diffusion on the quasi-linear growth of magnetic islands. A.M.Hilsdorf-Marotta (Inst. de Fisica Gleb Wataghin, Univ. Estadual de Campinas, Sao Paulo, Brazil), R.M.O.Galvao.

Phys. Lett. A (Netherlands), vol.94A, no.6-7, p.295-7 (21 March 1983).

It is shown that the rate at which a magnetic island grows in the non-linear stage of a tearing mode is reduced by the equilibrium resistive flow. (13 refs.)

61616 Plasma convection and line-tying. S.Fornaca (Dept. of Phys., Univ. of California, Irvine, CA, USA).

Phys. Fluids (USA), vol.26, no.3, p.797-804 (March 1983).

The directed motion of a low- β plasma across a toroidal magnetic field is examined as the degree of electrical contact between the plasma and a conducting end wall (line-tying) is varied in a controlled manner. Experimentally, little difference is found between the motion of a completely isolated plasma and that of a plasma in contact with a wall that does not emit electrons. As the degree of line-tying is increased by making the end wall electron-emitting, the cross-field convection of the plasma is increasingly suppressed. Beyond a critical emission current density, no further suppression is observed. When the system is in the surface-line-tying configuration, the suppression of the directed cross-field motion is accompanied by a large increase in the radial transport of plasma. (18 refs.)

61617 Influence of collisions and incoherence on ion-cyclotron transport in mirror plasmas. B.I.Cohen, R.H.Cohen, B.D.Rognien (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

Phys. Fluids (USA), vol.26, no.3, p.808-19 (March 1983).

The effects of classical Coulomb collisions and wave incoherence on drift-cyclotron-loss-cone (drift-cone) mode anomalous transport are studied analytically and by simulation. Pitch-angle collisions have a cumulative effect on the gyrophase angle, and the spatially varying magnetic field in a mirror well contributes a large geometrical amplification of the gyrophase-angle diffusion. Analytical calculations of this effect for particles with arbitrary pitch angle are confirmed by Monte Carlo simulations. However, for the levels of drift-cone turbulence observed in the 2XIIIB magnetic mirror experiment and for its relative collisionality, the effect of pitch-angle collisions on anomalous transport is small. In particular, heating of ions to 40 keV energies cannot be explained by this mechanism. Wave incoherence also destroys superadiabaticity, leads to velocity transport, and provides an approximate model of the finite frequency bandwidth of drift-cone turbulence, e.g. due to bursting effects in 2XIIIB. Monte Carlo simulations corroborate the analytical transport theory presented. The simulations exhibit significantly enhanced velocity-space transport and heating of ions to nearly 40 keV energies due to wave incoherence for parameters at the limit of applicability to the 2XIIIB experiment. These same considerations of resonant wave-particle interactions are also directly relevant to electron and ion-cyclotron resonance heating and to velocity diffusion driven by unstable Alfvén-ion-cyclotron waves in other mirror experiments. (19 refs.)

61618 Dense and multicomponent plasmas. C.Deutsch (Lab. de Phys. des Plasmas, Univ. Paris XI, Orsay, France).

Phys. Scr. (Sweden), vol.T2, no.1, p.192-7 (1982). (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Multicomponent systems of point charges with either sign are considered. Equilibrium and transport properties are investigated through temperature-dependent effective interactions taking into account the required amount of short-ranged and quantum effects (diffraction, symmetry, extended ion core). A particular emphasis is paid to the equation of state in the Sun interior, in connection with the neutrinos dilemma. The challenged Fe-H demixion is unlikely to occur. The author also considers quantum corrections to the particle diffusion in an electron-ion system, transversely to a very large and steady magnetic field ($q_2 \gg \omega_{pi}$). (20 refs.)

61619 Transport modelling in magnetic confinement experiments.

K.V.Roberts (Culham Lab., UKAEA, Abingdon, England).

10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.194-vol.4

Transport calculations in Tokamak devices model the time evolution of an azimuthal structure of plasma and magnetic field through a sequence of quasiequilibrium states, taking into account a variety of plasma and energy production and loss processes together with the behaviour of neutrals and impurities. The calculations alternate a 2D elliptic computation of the adiabatic changes in flux surface geometry with a coupled set of 1D parabolic diffusion equations for the entropy-generating processes. 52.25P Emission, absorption, and scattering of radiation

61620 X-ray generation from laser-produced plasmas and its atomic-number dependence. N.Nakano, H.Kuroda (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

Phys. Rev. A (USA), vol.27, no.4, p.2168-77 (April 1983).

Experimental studies of the X-ray generation from laser plasmas are performed by using a picosecond high-power laser. The intensity of emitted X-rays shows a periodic variation as a function of the atomic number of target materials. Calculations based on the transient collisional-radiative model rather than the conventional steady-state coronal model, are carried out. Experimental and computational results show good agreement with each

other, and indicate the importance of the transient nature of multiple-ionization processes. The dependence of hot-electron temperature on the atomic number is briefly discussed. (33 refs.)

61621 Transition radiation and transition scattering. V.L.Ginzburg (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Phys. Scr. (Sweden)*, vol.T2, no.1, p.182-91 (1982). (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Transition radiation is a process of a rather general character. It occurs when some source, which does not have a proper frequency (for example, a charge), moves at a constant velocity in an inhomogeneous and (or) nonstationary medium or near such a medium. The simplest type of transition radiation takes place when a charge crosses a boundary between two media (the role of one of the media may be played by vacuum). In the case of periodic variation of the medium, transition radiation processes some specific features (resonance transition radiation or transition scattering). Transition scattering occurs, in particular when a permittivity wave falls onto an nonmoving (fixed) charge. Transition scattering is closely connected with transition bremsstrahlung radiation. All these transition processes are essential for plasma physics. Transition radiation and transition scattering have analogues outside the framework of electrodynamics (like in the case of Vavilov-Cherenkov radiation). The corresponding range of phenomena is elucidated, as far as possible, in a generally physical aspect. (12 refs.)

61622 Characteristic features of transition radiation of charged particles in nonstationary magnetoactive plasma. L.I.Bondarenko, N.S.Erokhin. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.3, p.401-6 (March 1983). In Russian.

Transition radiation and the linear transformation of charged particles are considered arising when the charge moves uniformly through a homogeneous non-stationary magnetized plasma. (5 refs.)

52.30 PLASMA FLOW; MAGNETOHYDRODYNAMICS

(see also 47.65 Fluid dynamics)

61623 Idealised model for plasma acceleration in an MHD channel. K.Kuriki, Y.Kunii, Y.Shimizu (Inst. of Space and Astronautical Sci., Tokyo, Japan).

AIAA J. (USA), vol.21, no.3, p.322-6 (March 1983).

A quasi-one-dimensional plasma acceleration by a self-induced magnetic field was analysed in the magnetohydrodynamic framework. The magnetic Reynolds number was a similar parameter to describe the fields of flow and discharge current. The discharge current was found to be concentrated not only at the exit but also the entrance of the channel. By suitable electrode geometry, the current concentration was relaxed and the thrust efficiency was enhanced compared with the straight geometry. (7 refs.)

61624 Comments on 'Stability of shear flow in a magnetized plasma' [and reply]. B.K.Shivamoggi (Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia), Y.Y.Lan, C.S.Liu. *Phys. Fluids (USA)*, vol.26, no.3, p.867-8 (March 1983).

For original paper see Y.Y. Lau and C.S. Liu, *ibid.*, vol.23, p.939 (1980). The initial value problem analysis of the hydromagnetic Couette flow by Lau and Liu shows that the disturbances undergo a transient growth and an ultimate decay. The author feels that while this trend is in accord with the results in the hydrodynamic case the results still need further explanation. Lau and Liu reply to these comments. (11 refs.)

61625 Numerical investigation of the interaction between a plasma stream and a transverse magnetic field. Yu.N.Makarov (Polytech. Inst., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1104-6 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1802-5 (Sept. 1982). [received: April 1983]

A shock-capturing technique is used to investigate the interaction of the flow behind a shock wave with a transverse magnetic field. The calculation is based on the three-fluid model of a nonequilibrium ionized gas. The applicability of the simpler two- and one-fluid models is discussed. The flow in a regime with an open longitudinal current is investigated in detail, and the features of the deceleration and heating of a plasma in a regime with a short-circuited longitudinal current are described. The calculation results are compared with experimental data. (8 refs.)

52.35 WAVES, OSCILLATIONS, AND INSTABILITIES IN PLASMA

61626 Propagation of lower hybrid resonance cones in Tokamaks. P.M.Bellan (California Inst. of Technol. Pasadena, CA, USA).

Phys. Fluids (USA), vol.26, no.3, p.741-6 (March 1983).

The trajectory of the lower hybrid resonance cone surface is calculated for propagation in the helical magnetic field of a Tokamak. The surface is found to be a deformed cone, having symmetry axis following the magnetic field helicity. By superimposing cone fields excited by adjacent, poloidally separated point sources, the field excited by a source of finite poloidal extent is deduced. For sources having large poloidal extent, the superimposed cones destructively interfere everywhere except in a small region of constructive reinforcement which is located towards the plasma center; sources having small poloidal extent excite an individual resonance cone, which extends from near the plasma center all the way to the wall. Numerical calculations are presented for Verasator, Alcator-A and -C, JFT-2, and PLT Tokamak parameters. (21 refs.)

61627 Tearing modes in a general cross-section force-free cylindrical Tokamak. J.K.Lee, M.S.Chu, F.J.Helton (General Atomic Co., San Diego, CA, USA).

Phys. Fluids (USA), vol.26, no.3, p.766-74 (March 1983).

The stability of magnetohydrodynamic tearing modes for a large aspect ratio force-free Tokamak with general cross section is studied in terms of an energy principle. Determinations of the marginal stability boundary Δ' and island size using this general two-dimensional method give good agreement with those of known methods for circular equilibria. Results for noncircular equilibria are also presented. (19 refs.)

61628 Magnetohydrodynamic stability of magnetic slabs. A.Banos, Jr., E.A.Adler, B.D.Fried, J.Echart (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).

Phys. Fluids (USA), vol.26, no.3, p.780-9 (March 1983).

A simplified procedure is developed for calculating the ideal magnetohydrodynamic stability of a 'magnetic slab' consisting of two planar rows of staggered parallel conductors carrying oppositely directed (equal or unequal) currents, a configuration which is the planar analog of the University of California, Los Angeles, Large Mirror Ratio Experiment (LAMEX). Instead of solving the Grad-Shafranov equation to find the magnetic field corresponding to magnetohydrodynamic equilibrium, use was made of conformal mapping techniques to obtain analytical expressions for the vector potential A for the sharp boundary case, and then the plasma was allowed to 'spill over' into the vacuum region with a permissible pressure profile $p(A)$. Using conventional magnetohydrodynamic analysis, based on the well-known energy principle, the maximum stable pressure gradient on each magnetic surface was determined and, from that, the optimum permissible pressure profile $p(A)$ as a function of the spacings (horizontal and vertical) between the conductors and the currents in the two rows was also determined. Significant reductions in maximum stable beta are found compared to the sharp boundary case. (5 refs.)

61629 Oblique collision of cylindrical outgoing ion-acoustic solitons. I.Tsukabayashi, Y.Nakamura, F.Kako, K.E.Longgren (Inst. of Space & Astronaut. Sci., Tokyo, Japan).

Phys. Fluids (USA), vol.26, no.3, p.790-4 (March 1983).

Two identical cylindrical outgoing ion-acoustic solitons are transmitted in a double-plasma device to observe an oblique collision. The colliding angle of the solitons is smaller than the resonance angle given by $2 \tan^{-1}[(\partial n/\partial n)^{1/2}]$, where $\partial n/\partial n$ is the normalized amplitude of the solitons. Two new waves are observed to form in the region of the interaction. The experimental results are compared with a numerical integration of a modified Boussinesq equation and with a theory of three-wave interaction. (25 refs.)

61630 Measurement of growth rate of plasma drift wave excited by slow electrons. P.J.Barrett (Plasma Phys. Res. Inst., Univ. of Natal, Durban, S Africa), G.R.Allen.

Phys. Fluids (USA), vol.26, no.3, p.795-6 (March 1983).

Measurements are presented on drift waves which are driven unstable by an annular beam of slow electrons. The growth rate of the most unstable mode varies linearly with the injection velocity of the beam, in accordance with fluid theory. (8 refs.)

61631 Ion-ion two-stream instability in multispecies laser-produced plasma. S.P.Sarraf, E.A.Williams (Lab. for Laser Energetics, Univ. of Rochester, Rochester, NY, USA), L.M.Goldman.

Phys. Rev. A (USA), vol.27, no.4, p.2110-13 (April 1983).

Experimental observations of the high-energy ions (>10 keV/Z), expanding from a laser-produced plasma, have shown strong evidence of coronal electrostatic fields. In this paper, it is shown by a linear analysis that a multispecies streaming plasma can be subject to a two-stream ion-ion instability leading to density modulations. The effect of the charge-to-mass ratio on growth rate for different species accelerated by the same background electric field has been investigated. The theoretical model is consistent with experimental observations. (9 refs.)

61632 Experimental studies of parametric interaction near quarter critical density. H.A.Baldis, C.J.Walsh (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).

Phys. Scr. (Sweden), vol.T2, no.2, p.492-7 (1982). [received: April 1983]. (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

The authors present the results of a study, using Thomson scattering, of parametrically driven ion and electron plasma waves in a CO₂ laser-plasma interaction. The experiments were conducted in a pre-formed plasma at a density near the quarter critical density of the CO₂. Waves produced by two plasmon decay as well as the Raman and Brillouin scattering instabilities are observed. (22 refs.)

61633 Natural Poisson structures of nonlinear plasma dynamics. A.N.Kaufman (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Phys. Scr. (Sweden), vol.T2, no.2, p.517-21 (1982). [received: April 1983]. (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Hamiltonian field theories, for models of nonlinear plasma dynamics, require a Poisson bracket structure for functionals of the field variables. These are presented, applied, and derived for several sets of field variables: coherent waves, incoherent waves; particle distributions, and multifield electrodynamics. Parametric coupling of waves and plasma yields concise expressions for ponderomotive effects (in kinetic and fluid models) and for induced scattering. (20 refs.)

61634 Nonlinear drift waves. T.Taniuti (Dept. of Phys., Nagoya Univ., Nagoya, Japan), A.Hasegawa.

Phys. Scr. (Sweden), vol.T2, no.2, p.529-33 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Turbulence and solitary vortex structures of electrostatic drift waves are presented using a simple model equation based on two-dimensional cold ions and Boltzmann electrons. (12 refs.)

61635 Interaction of Langmuir solitons with resonant particles. K.Rypdal (Inst. for Math. & Phys. Sci., Univ. of Tromsø, Tromsø, Norway), J.P.Lynov, H.L.Pecseli, J.J.Rasmussen, K.Thomsen.

Phys. Scr. (Sweden), vol.T2, no.2, p.534-7 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

The effects of resonant particles on the propagation of Langmuir solitons are studied. The main effects are a deceleration of the solitons, and for high-amplitude solitons, emission of ion-sound tails. Results from perturbation theory are compared with numerical solutions of the model equations. (12 refs.)

61636 Transient effects of nonlinear wave propagation in magnetized plasmas. H.L.Pecseli, K.Thomsen (Riso Nat. Lab., Roskilde, Denmark).

Phys. Scr. (Sweden), vol.T2, no.2, p.541-5 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

The evolution of a steep wavefront propagating perpendicular to an externally applied homogeneous magnetic field is considered. The propagation is accompanied by the excitation of low-frequency waves. When the nonlinear interaction is taken into account the authors observe the evolution of a modulational instability trailing the wavefront. (18 refs.)

61637 On the transient effects of nonlinear wave propagation in magnetized plasmas. K.E.Lonngrén, H.L.Pecseli, J.J.Rasmussen, K.Thomsen (Riso Nat. Lab., Roskilde, Denmark).

Phys. Scr. (Sweden), vol.T2, no.2, p.546-7 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Approximate analytical solutions are obtained for the set of coupled nonlinear partial differential equations which govern the evolution of a steep wavefront propagating perpendicular to an externally applied homogeneous magnetic field. Several of the features noted in a numerical solution of these equations by Pecseli and Thomsen (ibid., vol.12, p.541, 1982) are predicted by these approximate solutions. (5 refs.)

61638 Thermal cavitons. K.B.Dysthe, E.Mjølhus, H.Pecseli, K.Rypdal (Inst. of Math. & Phys. Sci., Univ. of Tromsø, Tromsø, Norway).

Phys. Scr. (Sweden), vol.T2, no.2, p.548-59 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

The formation of small scale striations observed in ionospheric heating experiments is explained in terms of electrostatic waves propagating across the magnetic field, generated by linear conversion on the local density gradient and trapped in the density depletions. Enhancement of the process is due to ohmic overheating of the depletions, resulting in decreased density there. The process is centered at the upper hybrid level. Further growth is predicted when the initial density depressions exceed a threshold which is calculated. Such a nonlinear threshold is associated with a certain hysteresis phenomenon which has been observed in experiments. (28 refs.)

61639 Nonlinear effects in a beam plasma system: second harmonic emission and density depletion formation. J.A.Michel, P.J.Paris, M.Schneider, M.W.Tran (Ecole Polytech. Federale de Lausanne, Lausanne, Switzerland).

Phys. Scr. (Sweden), vol.T2, no.2, p.571-5 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

The nonlinear evolution of Langmuir waves excited by the beam-plasma instability is studied experimentally. The emission of electromagnetic waves at the second harmonic of the plasma frequency and the formation of a density depression have been observed. These phenomena are consistent with the predictions of the strong Langmuir turbulence theory. (27 refs.)

61640 Experimental study of the dissipative trapped ion instability. G.A.Navratil, A.K.Sen, J.Slough (Columbia Univ., New York, NY, USA).

Phys. Scr. (Sweden), vol.T2, no.2, p.585-7 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Experiments have been performed in a steady-state linear machine with a low temperature, low density plasma in the collisionality regime of the dissipative trapped ion instability. This instability was seen and identified through the observed dependence of wave amplitude on trapped fraction, axial and radial structure, and collisionality and through the scaling of the real frequency with trapped fraction. (5 refs.)

61641 Collisionless relaxation of phase oscillations of trapped particles in an accelerating amplitude-modulated wave. V.Ya.Davydovskii, Yu.S.Filippov (V.D. Kalmykov Radiotech. Inst., Tagerog, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1175-8 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1910-14 (Oct. 1982). [received: April 1983]

Relaxation of phase oscillations of particles in accelerating waves is studied for relativistic particles in amplitude-modulated waves with phase velocity greater than the speed of light. The analysis is based on averaged equations of motion and uses adiabatic invariants. The damping rate is determined in the linear approximation. (11 refs.)

61642 Discrimination effects in wave parametric interaction in a relativistic electron stream plasma. V.P.Zakharov, V.V.Kulish.

Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.406-11 (March 1983). In Russian. The process of the parametric interaction of two randomly polarized electromagnetic waves with the space-charge wave of a high-current relativistic electron stream is investigated. The effects of phase and polarization discrimination consisting of the gain coefficient dependence on the initial phases of oscillations and polarizations of the interacting waves are shown to produce a significant influence on the process of the electromagnetic signal gain. (8 refs.)

61643 Resistive MHD stability in Tokamaks. J.Manicham, R.C.Grimm, R.L.Dewar (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).

10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.175-6 vol.4

Reports on a program designed to study the linear stability of resistive modes in finite pressure, finite aspect ratio, and arbitrary cross-section Tokamaks using a boundary layer approach. (5 refs.)

61644 Linear MHD stability calculations. W.Kerner (Max-Planck-Inst. für Plasmaphys., Garching, Germany).

10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.179-81 vol.4

The Galerkin method is applied to the linearized MHD equations. For ideal MHD this leads to a Hermitian matrix eigenvalue problem, where accurate and efficient methods are known. But for nonideal MHD with general matrices the application is more difficult. (21 refs.)

52.35R Plasma turbulence

61645 Comments on 'Gravitational instability of a rotating anisotropic plasma with Hall's effect'. B.K.Shivamoggi (Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).

Phys. Fluids (USA), vol.26, no.3, p.867 (March 1983).

For original paper see P.D. Ariel, ibid., vol.13, p.1644 (1970). One of the effects of the Hall currents is the introduction of a cross flow so that the Hall effects dynamically lead, among other consequences, to those due to rotation. The author comments that it does not seem worthwhile to include the Hall effects in a dynamical analysis in which a rotation is already present. He is in agreement with Ariel who found the Hall effects lead to consequences that are identical to those due to rotation. (2 refs.)

61646 Theoretical determination of the electron distribution in the presence of an ion-acoustic turbulence. Tu Khiet (Lab. de Phys. des Gaz et des Plasmas, Univ. Paris-Sud, Orsay, France).

Phys. Rev. A (USA), vol.27, no.4, p.2237-40 (April 1983).

The author shows that, in the presence of an ion-acoustic turbulence, the electron velocity distribution function deforms irreversibly to a flat-topped shape in the central region and a nonthermal one in the tail region. The runaway part which behaves as v^{-m} , with $m=9/2$, is created with a completely specified production rate and is given by the turbulent collision frequency. (9 refs.)

61647 Topics in strong Langmuir turbulence. D.R.Nicholson (Dept. of Phys. & Astron., Univ. of Iowa, Iowa City, IA, USA).

Phys. Scr. (Sweden), vol.27, no.2, p.77-82 (Feb. 1983).

Progress in two approaches to the study of strong Langmuir turbulence is reported. In two spatial dimensions, numerical solution of the Zakharov equations yields a steady state involving linear growth, linear damping, and a collection of coherent, long-lived entities which might loosely be called solitons. In one spatial dimension, a statistical theory is applied to the cubically nonlinear Schrödinger equation and is solved analytically in a special case. (52 refs.)

61648 Experimental evidence of temperature gradient effects on the neutral gas penetration into a magnetized rotating plasma. M.Bures (Dept. of Plasma Phys. & Fusion Res., Royal Inst. of Technol., Stockholm, Sweden).

Phys. Scr. (Sweden), vol.27, no.2, p.83-90 (Feb. 1983).

The experimental evidence of temperature gradient effects on the neutral gas penetration into a plasma is presented. It is found that an increased temperature gradient reduces the neutral gas content in the partially ionized boundary layer of a cold gas blanket system. A strong modification of the rotating plasma equilibrium is then observed. Such an equilibrium is a sensitive function of the neutral gas concentration both in the plasma and its boundary layers. The moderate values of the centrifugal force which act both on the ions and neutrals do not appreciably influence the plasma permeability to neutral gas. It is further observed that an acceleration of neutrals takes place in a rotating plasma. (26 refs.)

61649 Nonlinear Landau damping phenomenon in a strongly turbulent plasma. N.L.Shatashvili (Dept. of Phys., Tbilisi State Univ., Tbilisi, USSR), N.L.Tsintsadze.

Phys. Scr. (Sweden), vol.T2, no.2, p.511-16 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

The authors give the systematic theory of the derivation of the generalized set of Zakharov equations for a collisionless isotropic plasma taking into account the nonlinear Landau damping and relativistic effect. The conditions of deriving the nonlinear Schrödinger equation from the generalized system are

shown. The new branch for modulational instability is found. The wave-wave-particle interaction leads to the braking of the soliton. (15 refs.)

61650 Magnetized-plasma turbulence. Dter Haar (Magdalen Coll., Univ. of Oxford, Oxford, England).

Phys. Scr. (Sweden), vol.T2, no.2, p.522-4 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

The author discusses the generalized Zakharov equations derived by Ovenden and Statham and given reasons for being sceptical about using the fluid approximation as is done in the derivation of these equations—except perhaps for those situations which involve weakly magnetized Langmuir plasmas and the author also compares them with equations suggested by other authors to describe strong turbulence in a magnetized plasma. (16 refs.)

52.35T Shock waves

61651 Characteristics of oblique shock waves produced in an expanding laser plasma. Tong-Nyong Lee (Optical Sci. Div., Naval Res. Lab., Washington, DC, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2082-99 (April 1983).

Stationary oblique shock waves produced by a laser-produced plasma (carbon and lithium) expanding over a wedge and related phenomena have been investigated experimentally. Such a plasma is characterised as an ionization-frozen multicomponent flow which consists of a number of different charge-state groups with different flow velocities. Well-defined multiple shock fronts which are formed around a wedge are differentiated using a spectroheliographic method. Data obtained from an ion-charge collector and from spectroheliographs indicate that these shock fronts (with differential inclinations) result from different flow components. The plasma behind the shock is predominantly recombining rather than ionizing. In addition, the innermost shock is found to be more like a transverse shock where the flow particles are transported along the shock plane. This is also evidenced by a large charged-particle cumulation (and collimation) which occurs when two such oblique shock waves are brought to intersect each other. The measured shock inclinations as a function of wedge angle indicate a considerable departure from a simple gasdynamic flow model. It is believed that the self-generated (reversed) magnetic field associated with the laser-produced-plasma shock greatly influences the shock behaviour. (39 refs.)

Assessment of shock-waves convergence-radius in spherical systems of explosion-induced plasma compression See Entry 61673

52.40 PLASMA INTERACTIONS

61652 Formation of electrostatic potential barrier between different plasmas. R.Hatakeyama, Y.Suzuki, N.Sato (Dept. of Electronic Engng., Tohoku Univ., Sendai, Japan).

Phys. Rev. Lett. (USA), vol.50, no.16, p.1203-6 (18 April 1983).

A potential depression is formed between two magnetized plasmas with different electron temperatures and ion species in the absence of electric current passing through them. The depression is deep enough to reflect both groups of electrons, reducing thermal contact between the plasmas. By addition of a magnetic bump to a uniform magnetic field, the potential dip is localized around the mirror point. A dependence of the phenomenon on neutral-gas pressure is also clarified. (12 refs.)

52.40D Electromagnetic wave propagation in plasma

61653 Resonant absorption in a self-consistent density profile at moderate intensities. F.David (Dept. de Phys. Theorique, CENS, Gif-sur-Yvette, France), P.Mora, R.Pellat.

Phys. Fluids (USA), vol.26, no.3, p.747-54 (March 1983).

A model for the nonlinear resonant absorption of an electromagnetic wave in an inhomogeneous collision-dominated plasma at moderate intensities is proposed. The wave propagation equations are numerically solved in the time-independent self-consistent density profile. A density step appears at the critical point, and a surface wave develops which tends to enhance the absorption. Extensions of the model to collisionless situations are given when the damping can be conveniently described by some phenomenological self-consistent collision frequency. Finally the effect of a plasma expansion across the critical density is briefly discussed. (20 refs.)

61654 Efficient way to prevent reflection from stimulated Brillouin backscattering. C.Montes (Centre Nat. de la Recherche Sci. Interaction Laser Matière, Lab. de Phys. de la Matière Condensée, Nice, France).

Phys. Rev. Lett. (USA), vol.50, no.15, p.1129-32 (11 April 1983).

The same physical mechanism which causes stimulated Brillouin backscattering of a laser pulse when interacting with the underdense plasma (in laser fusion systems) can be used to reverse the scattering direction in order to drastically reduce the reflectivity. Forced stimulated rescattering may be obtained by additional radiation pulses or by a multihumped spectrum with each peak down-shifted by twice the acoustic frequency. Analytical four-mode and numerical six-mode models show strong reduction of the reflectivity for the same input intensity. (18 refs.)

61655 Simultaneous Brillouin and Raman scattering in CO₂ laser-plasma interaction. A.A.Offenberger, R.Fedosejevs, W.Tighe, W.Rozmus (Dept. of Electrical Engng., Univ. of Alberta, Edmonton, Alberta, Canada).

Phys. Scr. (Sweden), vol.T2, no.2, p.498-505 (1982). [received: April 1983] (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

The authors report on experimental and theoretical studies of stimulated Brillouin and Raman scattering occurring simultaneously in moderate density, long scale length plasma irradiated by a moderate intensity CO₂ laser beam. Saturated Brillouin (20%) and Raman (0.7%) backscatter are observed, the former as a convective and the latter as an absolute instability. Importantly, it is found both experimentally and theoretically that the presence of ion fluctuations associated with the Brillouin process can profoundly affect the Raman instability. (29 refs.)

61656 Effect of radiating aperture characteristics on results of measurement of plasma pulsation distribution over the wave number spectrum. A.N.Serikov.

Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.388-94 (March 1983). In Russian. Relations are derived for the phase invariant dispersion of a modulated electromagnetic beam that passed through a statistically inhomogeneous plasma and for the weight function of a 'radiating aperture-medium under study-point receiver' system. It is shown that the weight functions of a system with a finite-size radiating aperture can significantly differ from similar ones for waves with a boundless front. When this fact is not taken into account, the plasma pulsation distribution over the wave number spectrum may be measured with an unjustifiably large error. (6 refs.)

61657 Measurement of surface wave dispersion in nonuniform plasma waveguides. V.M.Vorob'ev, A.N.Kondratenko, V.M.Kuklin (A.M. Gor'kii State Univ., Khar'kov, Ukrainian SSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1301-2 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2116-18 (Oct. 1982). [received: April 1983]

Considers how a nonuniform plasma density distribution affects surface wave dispersion for waves propagating in cylindrical and planar plasma waveguides. Quasielectrostatic nonsymmetric oscillations in a free radially nonuniform waveguide of radius R filled with cold plasma, and nonpotential RF waves in a semiinfinite nonuniform plasma are dealt with. Changes in the degree of plasma nonuniformity near the waveguide boundary greatly distort the dispersion characteristics of surface oscillations. (2 refs.)

52.40H Solid-plasma interactions

61658 Recent results obtained by use of accelerators on plasma edge properties in controlled fusion devices and on properties of high power neutral beams. R.A.Langley (Fusion Energy Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1187-92 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The study of plasma-wall interactions is of primary importance in present fusion devices. Measurements of incident fuel and impurity fluxes, retention and release of fuel atoms, and erosion of internal components are of particular interest. Accelerators in the megaelectronvolt range are being used both to measure the depth profile of fuel atoms implanted in samples placed in the plasma edge by use of nuclear reactions and to measure impurities and film thicknesses by use of elastic scattering reactions. Secondary ion mass spectrometry (SIMS) is used to determine flux and energy distributions of fuel atoms and to measure species composition and impurities in the beams of high power neutral beam injectors. Recent results obtained with these techniques are presented and areas of future study are discussed. (30 refs.)

61659 Retention and recycling of plasma edge hydrogen isotopes in C and TiC. D.K.Brice, B.L.Doyle, W.R.Wampler, S.T.Picraux (Sandia Nat. Labs., Albuquerque, NM, USA), L.G.Haggmark.

J. Nucl. Mater. (Netherlands), vol.114, no.2-3, p.277-91 (Feb. 1983).

The retention, release, and isotopic exchange of hydrogen, deuterium, and tritium incident on room temperature C and TiC with Maxwellian velocity and isotropic angular distributions have been calculated using the Local Mixing Model. The calculations are based on the hydrogen saturation concentration, range distributions and isotopic exchange behavior, all of which have been verified experimentally by monoenergetic implants. Particle fluences (10^{16} to $10^{20}/\text{cm}^2$) and characteristic Maxwellian energies (50 eV to 3200 eV) were chosen in the range of interest for Tokamak plasma edge conditions. The results of these calculations are used to estimate tritium inventory build-up and to predict tritium changeout rates by isotopic exchange in Tokamaks and other fusion devices. Tritium inventories in the TiC components (which comprise $\geq 20\%$ of the TFTR first-wall surface) are anticipated to remain at reasonable levels in TFTR, and isotopic exchange is shown to be a feasible method to reduce these tritium inventories. (16 refs.)

61660 Sputtering of titanium and niobium hydrides. Y.Hirooka (Graphite Res. Lab., JAERI, Ibaraki, Japan), H.Shinmura, T.Sano.

J. Nucl. Mater. (Netherlands), vol.114, no.2-3, p.341-3 (Feb. 1983).

Since titanium has recently been proposed as an impurity gettering film to be deposited on vacuum walls because of its high absorptivity to gases, and over the last several years niobium has also been considered to be one of the candidate structural materials for fusion reactors, the authors considered it to be of interest from a fusion technology viewpoint to investigate sputtering behavior of these metals with certain hydrogen contents. Specimens used were cold rolled titanium and niobium sheets having the respective hydrogen concentration ranges of 0.0 to 1.0 and 0.0 to 0.7 in terms of the atomic ratio H/M. (20 refs.)

52.40K Sheaths

61661 Numerical double layer solutions with ionisation. D.Andersson (Dept. of Plasma Phys., Royal Inst. of Technol., Stockholm, Sweden), J.Sorensen.

J. Phys. D (GB), vol.16, no.4, p.601-11 (14 April 1983).

Maxwell's equation $\text{div } D = \rho$ in one dimension is solved numerically, taking ionisation into account. Time independent anode sheath and double-layer solutions are obtained. By varying voltage, neutral gas pressure, temperature of the trapped ions on the cathode side and density and temperature of the

trapped electrons on the anode side, diagrams are constructed that show permissible combinations of these parameters. Results from a recent experiment form a subset. Distribution functions, the Langmuir condition, some scaling laws and a possible application to the lower ionosphere are discussed. (12 refs.)

61662 Kinetic theory of phase space vortices and double layers. H.Schamel (Inst. für Theoretische Phys., Ruhr-Univ. Bochum, Bochum, Germany).

Phys. Scr. (Sweden), vol.T2, no.1, p.228-37 (1982). (1982 International Conference on Plasma Physics, Göteborg, Sweden, 9-15 June 1982).

The time-stationary theory of phase space holes and double layers is reviewed. Smooth solutions of the Vlasov-Poisson-system for electron and ion-holes, and two kinds of double layers are presented and discussed. Both types of holes are shown to be nonlinear extensions of slow acoustic modes. They appear due to a distortion of the relevant distribution in the resonant region, thereby forming a vortex structure in phase space. The holes are found to be unstable with respect to transverse perturbations. In contrast to electron holes which can acquire any strength, the electrostatic energy associated with ion holes is limited by the electron thermal energy. In addition, a finite temperature ratio ($T_e/T_i \geq 3$) is required for ion holes to exist. An interpretation of ion acoustic double layers which are observed in current-driven simulations in terms of asymmetric ion holes is given. The solution for the monotonic double layer, which is found experimentally in beam or voltage-driven plasmas, proves the necessity of four kinds of beam-type distributions for free and trapped electrons and ions, respectively. The 'Bohm criterion' is justified from the kinetic point of view, and the 'Langmuir condition' is shown to be preferred by stability arguments. The scaling law for the width of strong double layers is confirmed analytically. Finally, a scenario of double layer formation suggested by recent particle simulations is sketched, in which electron reflection and current reduction play a dominant role. (77 refs.)

A review of double layer simulations See Entry 64373

52.40M Beam interactions in plasma

61663 Cyclotron excitation of fast magnetosonic waves by circulating thermonuclear alpha particles in a Tokamak. T.D.Kaladze, A.B.Mikhailovsky (I.N. Vekua Inst. of Appl. Math., Tbilisi State Univ., Tbilisi, USSR).

Phys. Lett. A (Netherlands), vol.94A, no.6-7, p.293-4 (21 March 1983). Resonant interaction of fast magnetosonic waves with circulating thermonuclear α -particles in a Tokamak reactor is theoretically investigated. It is shown that such an interaction causes an instability whose growth rate is higher than those of the instabilities considered so far. (8 refs.)

61664 Nonlinear energy flow in a beam-plasma system. D.A.Wheeler, R.L.Stenzel (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).

Phys. Rev. Lett. (USA), vol.50, no.15, p.1133-6 (11 April 1983). The three-dimensional character of the beam-plasma instability is investigated. The true beam-electron distribution function is resolved with a novel directional energy analyzer. The electron plasma waves ($\omega \approx \omega_{pe} \gg \omega_{pi}$) are observed to develop a large spread in perpendicular wave numbers ($k_{\perp} \approx k_{\parallel}$) and damp in a relatively short distance producing an energetic electron tail on the background distribution. The damping is believed to be due to strong ion fluctuations which produce an anomalous resistivity. (13 refs.)

61665 Computer simulation on the scattering of electron beams in a plasma. H.Amamiya (Plasma Phys. Lab., Inst. Phys. & Chem. Res., Saitama, Japan).

Sci. Pap. Inst. Phys. & Chem. Res. (Japan), vol.76, no.4, p.83-95 (Dec. 1982).

Computer simulation on a one dimensional beam-plasma interaction is done in order to understand the nonlinear behavior of the primary electrons in low pressure discharge plasmas, where the beam is neither small in density nor cold. The particle-in-cell model is used with the electron represented as a charged rod with a length of one Debye length and a uniform charge, to see only the effect of collective modes. The dispersion of the excited wave agrees qualitatively well with the linear theory. The temporal behavior of the wave and the spatial variations of beam velocity and electric field are compared with the trapping theory, and some different features from those of the single wave theory for a small and cold beam are shown. The time-average beam velocity distribution function exhibits a splitting structure superimposed on a stochastic broadening. (37 refs.)

61666 Coherent electromagnetic radiation of an electron-ion beam. I.V.Bachin, V.V.Krasovitskii.

Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.371-4 (March 1983). In Russian. Nonlinear electromagnetic oscillations are considered which arise due to electron-ion beam interaction with the field of a slow electromagnetic wave. It is shown that the polarization field due to nonlinear collective inhibition of an electron beam relative to an ion one exerts a significant effect on the process of instability development under conditions of an anomalous Doppler effect at low density of the background plasma. As a result the energy density for a coherent electron-ion beam radiation may be considerably higher than the analogous value for an electron beam. (4 refs.)

52.50 PLASMA PRODUCTION AND HEATING

61667 An analysis of the induction plasma heating in the microwave frequency range. E.Reszke (Inst. of Telecommunication & Acoustics, Tech. Univ. of Wrocław, Wrocław, Poland).

Mater. Sci. (Poland), vol.7, no.4, p.453-61 (1981).

The simple theoretical model of the high pressure H-type microwave discharge and some exemplary results of calculations for nonflowing atmospheric pressure oxygen plasma are presented. In the analysis the existence of the LTE state in plasma has been assumed and only one component of the HF magnetic field parallel to the axis of the cylindrical plasma column has been considered. Using a numerical procedure the self-consistent system of differential equations has been solved giving typical distributions of electromagnetic

and temperature fields. The boundary conditions for heat transfer from plasma to the quartz tube surrounding the discharge were introduced analytically in order to find the real plot of the axial plasma temperature versus the density of the microwave energy absorbed. The results turn out to be useful for the future development of the new kind of microwave plasmatrons with the H-type discharges. (7 refs.)

61668 Vaporization mode and state of the ablatant of a deuterium pellet in Tokamak discharges. C.T.Chang (Riso Nat. Lab., Roskilde, Denmark).

Phys. Fluids (USA), vol.26, no.3, p.805-7 (March 1983).

The ablation of a deuterium pellet under prevailing Tokamak discharge conditions is shown to be a dynamic phase transition process. An alternative boundary condition at the pellet surface is formulated. Computational results based on the new boundary condition showed that the state of the ablatant in the subsonic region depends on the boundary condition used but is hardly affected in the supersonic region. The scaling law of the pellet ablation rate, therefore, is insensitive to the boundary condition imposed. (6 refs.)

61669 Hot-electron energy deposition in CO₂-laser-irradiated targets consistent with magnetic-field-induced surface transport. J.C.Kieffer, H.Pépin, M.Piche, J.P.Matte, T.W.Johnston, P.Lavigne, F.Martin (Inst. Nat. de la Recherche Sci.-Energie, Univ. du Québec, Varennes, Québec, Canada), R.Decoste.

Phys. Rev. Lett. (USA), vol.50, no.14, p.1054-7 (4 April 1983).

Hard-X-ray continuum spectra from high-Z tracers are used to obtain lateral and axial energy-deposition profiles by hot electrons in CO₂-laser-irradiated slab targets. The interpretation of the results emphasizes a local direction of incidence of the hot electrons on the target and an energy-deposition pattern which are consistent with self-generated magnetic fields. (17 refs.)

61670 Towards upper bound levels: thermonuclear fusion. J.Vedel (Centre d'Etudes de Limeil, Villeneuve-Saint-Georges, France).

Rev. Gen. Electr. (France), no.2, p.89-95 (Feb. 1983). In French.

Introduces the use of power lasers to achieve controlled thermonuclear fusion. After describing thermonuclear fusion and the conditions of temperature density and duration, required to bring it into being, the author shows how the laser enables such conditions to be created. In order to illustrate the importance of a laser which will be used for studying the production of fusion reactions, he describes the neodymium-doped glass laser NOVA that is being installed at the Livermore Laboratory in the USA; at the time of its completion in 1984, this laser will be the most powerful in the world. In comparison the OCTAL laser in operation at the Limeil establishment Centre d'Etudes de Commissariat Français à l'Energie Atomique is more modest; it is also presented. To conclude the author presents a project for a thermal power station with a fusion reactor as heat source. Energy from fusion is recovered by liquid lithium which regenerates the consumed tritium through a nuclear reaction with emitted neutrons. (5 refs.)

61671 Plasma production during vaporization of materials by the radiation from a CO₂ TEA laser. S.V.Gaponov, M.D.Strikovskii (Inst. of Appl. Phys., Acad. of Sci., Gorki, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1127-30 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1838-42 (Sept. 1982).

[received: April 1983]

The energy and space and time dependence are investigated for a laser flare. Two qualitatively different regimes are discovered for the ejection of the plasma, where the transition between them has a threshold character (in the radiation flux density). The measured dependence of the threshold on the atomic number of the target element has a form which is indicative of a connection between the dynamics of the flare formation and the electronic structure of the atom. A model is proposed for interpreting this effect. (10 refs.)

61672 Theory of heating and compression of double-shell spherical targets exposed to a laser pulse. N.G.Basov, E.G.Gamali, S.Yu.Gus'kov, V.B.Rozanov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1268-73 (Oct. 1982). Translation of: *Kvantovaya Elektron. Moskva (USSR)*, vol.9, no.10, p.1945-54 (Oct. 1982). [received: April 1983]

A theory is proposed for the acceleration, heating and compression of a double-shell target exposed to a laser pulse. It is shown that in the hydrodynamic regime the inner shell may be accelerated to velocities of ~ 200 km/sec, the energy density in the central stage may be increased whilst maintaining a high plasma density, and ultimately an inhomogeneous laser plasma configuration may be achieved, this being required for the evolution of a self-sustaining wave of fusion reactions. Depending on the aim of the experimental investigations (achieving a high plasma density of temperature), various systems for matching the parameters of a double-shell target with the characteristics of the laser pulse are proposed. 61673 Assessment of shock-waves convergence-radius in spherical systems of explosion-induced plasma compression. K.Jach (S. Kaliski Inst. of Plasma Phys. and Laser Microfusion, Warsaw, Poland).

J. Tech. Phys. (Poland), vol.22, no.4, p.407-13 (1981).

In order to effect real quantitative assessments of e.g. the neutron yield in microfusion systems, it is necessary to define a radius referred to as the convergence radius, for which the self-similar solution maintains its validity. It is shown that, in spherical symmetry, the radiation-induced limitation is stronger than the conduction-induced one. In cylindrical symmetry, the two dissipative effects are found to be competitive. (10 refs.)

61674 Analysis of axial-outflow in cylindrical deuterium-plasma sample compressed radially by imploding liner. A.Galkowski, R.Swierczynski, E.Wlodarczyk.

J. Tech. Phys. (Poland), vol.22, no.4, p.443-53 (1981).

The explosion-driven cylindrical layered system is considered. The problems of hydrodynamic outflow and of defining the zone of one-dimensional motion of plasma are analysed. (9 refs.)

52.55 PLASMA EQUILIBRIUM AND CONFINEMENT

61675 Intense relativistic electron beam injector system for Tokamak current drive. V.L.Bailey, J.M.Creedon, B.M.Ecker, H.I.Helava (Phys., Internat. Co., San Leandro, CA, USA).

J. Appl. Phys. (USA), vol.54, no.4, p.1656-65 (April 1983).

The authors report experimental and theoretical studies of an intense relativistic electron beam (REB) injection system designed for Tokamak current drive experiments. The injection system uses a standard high-voltage pulsed REB generator and a magnetically insulated transmission line (MITL) to drive an REB-accelerating diode in plasma. A series of preliminary experiments has been carried out to test the system by injecting REBs into a test chamber with preformed plasma and applied magnetic field. REBs were accelerated from two types of diodes: a conventional vacuum diode with foil anode, and a plasma diode, i.e. an REB cathode immersed in the plasma. REB current was in the range of 50 to 100 kA and REB particle energy ranged from 0.1 to 1.0 MeV. MITL power density exceeded 10 GW/cm². Performance of the injection system and REB transport properties is documented for plasma densities from 5×10^{12} to 2×10^{14} cm⁻³. Injection system data are compared with numerical calculations of the performance of the coupled system consisting of the generator, MITL, and diode. (42 refs.)

61676 Plasma behaviors in the open field region of reversed-field theta-pinch. Y.Aso, K.I.Hirano (Inst. of Plasma Phys., Nagoya Univ., Nagoya, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1095-7 (April 1983).

A characteristic behavior of the plasma in an open field region of reversed field theta pinch has been studied with the guide field (GF) which extends the field line along the axial direction. The experimental result suggests that the rotational instability may be induced after the plasma touches the wall at the ends of the open field. (3 refs.)

61677 Synchrotron emission from a relativistic loss-cone distribution with application to the ELMO Bumpy-Torus experiment. D.Winske, D.A.Boyd (Lab. for Plasma, Univ. of Maryland, College Park, MD, USA).

Phys. Fluids (USA), vol.26, no.3, p.755-65 (March 1983).

Analytic expressions for the power emitted per unit volume per solid angle per unit frequency at perpendicular propagation as synchrotron radiation from a relativistic loss-cone distribution of electrons are derived and compared with exact numerical results. These expressions are useful for understanding how the radiation scales and for inferring properties of the plasma from measurements of the radiation. As an example, it is shown that the temperature and loss-cone angle of the electron distribution in the ELMO Bumpy Torus (EBT) ring can be determined in a straightforward fashion from the ratio of radiation in the two polarizations at two frequencies. Also, it is demonstrated that the loss-cone angle can be determined from the frequency at which this emission ratio is a minimum, even if the emission ratio itself cannot be measured very accurately. (23 refs.)

61678 Electron confinement studies on the EBT-S Bumpy Torus experiment using soft X-ray techniques. D.L.Hillis, G.R.Haste, L.A.Berry (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Phys. Fluids (USA), vol.26, no.3, p.820-9 (March 1983).

Soft X-ray bremsstrahlung measurements have been performed on the ELMO Bumpy Torus (EBT-S) plasma to determine the electron temperature T_e and electron density n_e using a calibrated Si(Li) detector over a wide range of operating conditions. The purpose of this paper is to outline the necessary assumptions and essential X-ray techniques that are inherent in soft X-ray measurements in order to investigate the electron heating and confinement properties of EBT-S. In addition, by utilizing the electron density as determined by the soft X-ray measurements, the previous EBT-S confinement analyses have been extended. The steady-state plasma of EBT-S is heated by microwaves using a continuous wave (CW) gyrotron that can operate up to power levels of 200 kW. From the soft X-ray measurements, both the electron temperature and density are found to increase at higher microwave power levels. For operation at microwave power levels of 200 kW, T_e approaches 1 keV while n_e approaches 1.2×10^{12} cm⁻³. In general, confinement properties are found to improve with increased microwave power. The data are compared with neoclassical transport scaling and the electron transport is found to be collisionless ($\nu/\Omega < 1$) as well as neoclassical. (26 refs.)

61679 Forced magnetic reconnection. R.M.Kulsrud, T.S.Hahm (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).

Phys. Scr. (Sweden), vol.T2, no.2, p.525-8 (1982). [received: April 1983]

(1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

It has been generally accepted that a toroidal magnetostatic equilibrium can be specified by giving its boundary, the general topology of the magnetic field, and the distribution of mass. For example, if it is assumed that the magnetic field lies on nested toroidal magnetic surfaces and the pressure is given on each surface, then a unique equilibrium with these properties exists. In actual fact this need not be the case. If such an equilibrium exists, then by changing the state of the boundary in a manner that effectively resonates with the closed lines on one of the rational surfaces and demanding identical topology, a new equilibrium is produced that has surface currents on this

resonant surface. Equilibria which are exactly axisymmetric have nested toroidal surfaces. But it is obviously impossible to set up such exact surfaces so it is reasonable to expect that toroidal equilibria need not have nested magnetic surfaces, even of a nonsymmetric kind. Grad arrived at his conclusions from very general mathematical considerations and also from experience in numerical determination of equilibria such as in the Doublet. It was not possible for him to follow the evolution of equilibria in time because of the complexity of the general situation. Taylor suggested a much simpler model which brought out these problems in a much more explicit manner. The authors describe Taylor's model and then give the explicit evolution in time of the MHD system as it passes to a new equilibrium. (4 refs.)

61680 Self-excitation of periodic cyclotron instability regimes in a plasma magnetic trap. P.A.Bespalov (Inst. of Appl. Phys., Acad. of Sci., Gorky, USSR).

Phys. Scr. (Sweden), vol.T2, no.2, p.576-9 (1982). [received: April 1983]

(1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Steady-state cyclotron radiation of extraordinary electronic waves (whistlers) may be unstable in a plasma trap with magnetic mirrors. The periodic self-modulation of cyclotron instability takes place for a certain (sufficiently small) power of a particle source and a certain angular dependence of its parameters. This modulation is due to the change in the distribution function anisotropy. The change in anisotropy has an effect similar to that of an optic nonlinear filter. The characteristics of the spike-like periodic cyclotron instability regime are found. (12 refs.)

61681 Plasma stability in the axisymmetric open-ended systems.

V.V.Arsenin (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).

Phys. Scr. (Sweden), vol.T2, no.2, p.580-4 (1982). [received: April 1983]

(1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Different methods of plasma stabilization in axisymmetric mirrors are described. Some stabilizing mechanisms of MHD and kinetic nature are discussed for rather long systems. (21 refs.)

61682 Study of poloidal magnetic fields in the Tuman-3 Tokamak.

V.A.Belyakov, V.I.Vasil'ev, A.G.Kolchin, Yu.A.Kostov, R.N.Litunovskii, O.A.Minayev, M.P.Gryaznevich, N.V.Sakharov, A.N.Kozyrev, K.G.Shakhovets, A.A.Fedorov.

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1196-9 (Oct. 1982).

Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1946-52 (Oct. 1982). [received: April 1983]

Results are reported from measurements of the poloidal magnetic fields in the Tuman-3 Tokamak. The iron core of the magnetic conductor inside the plasma-filled region (aspect ratio $R/a=2.3$) greatly influences the conditions needed to sustain an equilibrium plasma column. The experimental data are compared with calculations obtained by solving a magnetostatic problem in the axisymmetric approximation. The calculated results for the model magnetic conductor agree with the experimental data to within ~5%. For the configuration studied, the poloidal field sustained a stable equilibrium plasma column of large radius with small vertical instability; the cross section of the plasma column was nearly circular. Under the experimental conditions, the parameters of the poloidal magnetic field depend only weakly on the degree of saturation of the iron core. The measurements are used to design a system for controlling the position of the plasma column. (1 ref.)

61683 Diffusion losses of ions and electrons in the 'Jupiter-1A' electromagnetic trap. I.A.Stepanenko, A.D.Komarov.

Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.395-400 (March 1983). In Russian.

Electron and ion diffusion currents out of an electromagnetic trap were investigated. Diffusion losses of electrons along the magnetic field amounted to 3÷30% of an integral electron losses and decreased exponentially with the cutoff voltage increase. The transverse diffusion of low-energy electrons trapped in the line cusp area is the main part of an electron loss. The characteristic frequency of this process is of the same order of magnitude as an electron-ion collision frequency. Ion losses through the line cusp are the main part of integral ion losses. Anomalous transverse diffusion losses were found in the near-axial area. The transverse ion losses accounted for a considerable part (25%) of the integral losses. (7 refs.)

61684 Tokamak disruptions. J.A.Wesson, A.Sykes, M.F.Turner.

Report CLM-R 233, UKAEA, Culham, Abingdon, Oxon., England (1982), 9 pp.

Available from HMSO, London, England.

An explanation is given for the occurrence of Tokamak disruptions. Under normal conditions the tearing instability is self-stabilising through its reduction of the destabilising current gradient and a saturated state can then exist. However, under certain conditions further growth of the instability is itself destabilising and a disruption results. The transition to disruption has the form of a catastrophe. (9 refs.)

61685 Computational methods for 3D nonlinear magnetohydrodynamics.

O.Betancourt (Courant Inst., New York Univ., New York, NY, USA).

10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.177-8 vol.4

Computational methods are described to investigate the equilibrium and stability of a toroidal plasma in three dimensions, based upon the variational principle of magnetohydrodynamics. (9 refs.)

61686 The computational model for the control of plasma position in TEXTOR. A.Kalek (Inst. fur Plasmaphys., KFA, Julich GmbH, Julich, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1197-201 vol.2

Approximate equations describing the axisymmetric motion of the circular TEXTOR plasma without inertial terms are derived and discussed. Since TEXTOR has an iron-core transformer, the mutual inductances and their spatial derivatives had to be calculated by the POISSON code of Winslow (1966) which was improved by the ICCG method of DS Kershaw (1978). Also eddy currents in the vacuum vessel had to be calculated by a computer code. Positional stability and stabilization by eddy currents are considered, and the requirements on the feedback control system are ascertained. The equations resulting from this work have been the basis for the design of the feedback system of TEXTOR. (10 refs.)

61687 Equilibrium and stability of plasma motion in an iron-core Tokamak. A.V.Kuznetsov, R.N.Litunovskii, O.A.Minayev, P.P.Teplov (D.V. Efremov Sci. Res. Inst. of Electrophysics, Apparatus, Leningrad, USSR).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1203-7 vol.2

In developing and investigating the control system of the plasma position and current in a Tokamak, the main tasks are as follows: the main mode calculation

tion of the supply system of the poloidal field coils; the investigation of plasma motion stability. The first task can be solved by means of a magnetostatic code. It is preferable to use the dynamic mode calculation, which allows determination of the 'equilibrium' currents and voltages of the poloidal field coils. The calculation technique, applied to investigate the T-15 plasma position control system, is discussed. Similar calculations have been accomplished for the steep-type torus 'Tuman-3'. Results are compared with the experimental data, obtained for the ohmic heating Tokamak operation. In an iron-core Tokamak the effect of plasma attraction to the core changes greatly the horizontal motion picture. Results of the plasma motion stability in T-15 and 'Tuman-3' are presented. The operation conditions of 'Tuman-3' at the discharge start, when the inductor current is near zero and the magnetic flux is 'frozen' by the chamber current are discussed in detail. The experimental data of the plasma position control system for 'Tuman-3' are given. (3 refs.)

61688 Experience with feedback and feedforward for plasma control in ASDEX. F.Schneider (Max-Planck-Inst. für Plasmaphys., Garching, Germany).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1227-32 vol.2

Experimental results of vertical and radial position feedback are shown and discussed. In particular, stability problems of vertical position control are studied in detail. A feedforward procedure for the process computer is described and proved by measurements. (5 refs.)

61689 Applicability verification of Tokamak plasma equilibrium control models. K.Yoshioka, T.Kobayashi, M.Abe, S.Uchikawa, K.Takemaru (Energy Res. Lab., Hitachi Ltd., Hitachi, Japan).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1233-8 vol.2

The applicability of dynamic models used to evaluate the control performance of plasma equilibrium position is verified through the use of data obtained in experiments with the Hitachi Tokamak HT-1. The major radius of the plasma in the HT-1 is 0.35 m. Emphasis has been placed on the evaluation of the behavior of eddy currents on surrounding structures and on the evaluation of changes in the minor radius due to plasma displacement. A integral formulation of Maxwell equations has been solved numerically to evaluate eddy current behavior on the vacuum vessel and supporting disk. The calculated values obtained for the magnetic fields generated by the eddy currents agree with the measured values obtained for those fields with an error of about 10%. Feedback control gains of the HT-1 are adjusted on the basis of the results obtained from the models and phase margin criterion. The position of the plasma is regulated to within 5.0 mm of the desired position. (8 refs.)

61690 Surface density profile of the one-component plasma. J.P.Badiali, M.L.Rosinberg (CNRS, Phys. des Liquides et Electrochimie, Univ. Pierre et Marie Curie, Paris, France), D.Levesque, J.J.Weis.

J. Phys. C (GB), vol.16, no.11, p.2183-95 (20 April 1983). Monte Carlo computations of the surface density profile and the surface energy of the classical one-component plasma have been made for different values of the plasma parameter Γ . Two different situations are considered: when the ions are in contact with an impenetrable wall and when they are

confined by the background itself. In the former case, comparison is made with the predictions of the integral equations based on the hypernetted chain and mean spherical approximations. The influence of the width of the background profile is also examined. (15 refs.)

61691 Numerical simulation of slow spheromak formation: flux control by formation speed. T.Sato (Inst. for Fusion Theory, Hiroshima Univ., Hiroshima, Japan), A.M.M.Todd, H.Okuda.

Phys. Fluids (USA), vol.26, no.3, p.775-9 (March 1983). Two-dimensional magnetohydrodynamic simulations of the Princeton S-1 Spheromak have been carried out for several formation speeds. It is found that the spheromak size and shape, and hence the confined poloidal and toroidal fluxes, are largely dependent upon the formation speed, provided this is moderately slow. Specifically, the total toroidal and poloidal fluxes in a spheromak increase as the formation speed is reduced. The role of externally driven reconnection as a cause for this dependence is discussed. (13 refs.)

61692 Particle simulation of plasmas. J.M.Dawson (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).

Rev. Mod. Phys. (USA), vol.55, no.2, p.403-47 (April 1983). For plasma with a large number of degrees of freedom, particle simulation using high-speed computers can offer insights and information that supplement those gained by traditional experimental and theoretical approaches. The technique follows the motion of a large assembly of charged particles in their self-consistent electric and magnetic fields. With proper diagnostics, these numerical experiments reveal such details as distribution functions, linear and nonlinear behavior, stochastic and transport phenomena and approach to steady state. Such information can both guide and verify theoretical modeling of the physical processes underlying complex phenomena. It can also be used in the interpretation of experiments. (105 refs.)

61693 3D nonlinear initial value calculations in resistive MHD. J.A.Holmes, H.R.Hicks, B.A.Carreras, L.Garcia, V.E.Lynch, B.F.Masden (Computer Sci., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.183-4 vol.4

An approach to the simulation of the resistive MHD equations in toroidal geometry is described. The equations are solved as an initial value problem using a mixed finite difference-spectral technique in a coordinate system based on the equilibrium magnetic field. A partially implicit first order time integration techniques in order to minimize storage and computational work. (9 refs.)

61694 Simulation of plasma formation and attainment of equilibrium. C.K.Chu (Dept. of Appl. Phys. & Nuclear Engng., Columbia Univ., New York, NY, USA).

10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.185-7 vol.4

Describes the main features and different applications of a two-dimensional magnetohydrodynamic code, that simulates plasma formation and the approach to equilibrium. The essential characteristics and most interesting results from each application are given, and a complete reference is appended for all the applications to date. Future developments and uses are discussed. (13 refs.)

61695 Magnetic fusion energy and computers. J.Killeen (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.188-90 vol.4

The application of computers to magnetic fusion energy research is essential. In the last several years the use of computers in the numerical modeling of fusion systems has increased substantially. There are several categories of computer models used to study the physics of magnetically confined plasmas. A comparable number of types of models for engineering studies are also in use. To meet the needs of the fusion program, the National Magnetic Fusion Energy Computer Center has been established at the Lawrence Livermore National Laboratory. A large central computing facility is linked to smaller computer centers at each of the major MFE laboratories by a communication network. In addition to providing cost effective computing services, the NMFEEC environment stimulates collaboration and the sharing of computer codes among the various fusion research groups. (2 refs.)

61696 Implicit methods in particle simulation. B.I.Cohen (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.191-3 vol.4

Surveys recent advances in the application of implicit integration schemes to particle simulation of plasmas. The use of implicit integration schemes is motivated by the goal of efficiently studying low-frequency plasma phenomena using a large timestep, while retaining accuracy and kinetics. Implicit schemes achieve numerical stability and provide selective damping of unwanted high-frequency waves. The author reviews the implicit moment and direct implicit methods. The merging of implicit methods with orbit averaging can result in additional computational savings. (18 refs.)

61697 Multi-dimensional hybrid simulation techniques in plasma physics. D.W.Hewett (Los Alamos Nat. Lab., Los Alamos, NM, USA).

10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.198-200 vol.4

Multi-dimensional hybrid simulation models have been developed for use in studying plasma phenomena on extended time and distance scales. The models make fundamental use of the small Debye length or quasi-neutrality assumption. The ions are modeled by particle-in-cell (PIC) techniques while the electrons are considered a collision-dominated fluid. The fields are calculated in the nonradiative Darwin limit. Some electron inertial effects are retained in the finite electron mass model (FEM). (7 refs.)

52.70 PLASMA DIAGNOSTIC TECHNIQUES AND INSTRUMENTATION

- 61698 Two pulse multiple position Thomson scattering system.** S.Sudo, K.Kondo, T.Mutoh, H.Zushi, A.Iiyoshi, K.Uo (Plasma Phys. Lab., Kyoto, Uji, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.3, p.485-90 (March 1983).
A Thomson scattering system for simultaneous measurements of the electron temperature and density at ten different positions at two times during a single plasma shot has been developed for Heliotron E. The apparatus consists of two ruby lasers each delivering two pulses whose temporal separation is typically 100 ms; light collection optics including automatic positioning mechanisms; 80 detectors; and a data processing system. The author has obtained spatial profiles of T_e (0.05-1.3 keV) and n_e ($0.23\text{-}9.0 \times 10^{19} \text{ m}^{-3}$) in Heliotron E for each plasma shot.
- 61699 Experiments in Belfast relevant to fusion diagnostics.** H.B.Gilbody (Dept. of Pure & Appl. Phys., Queen's Univ. of Belfast, Belfast, N Ireland). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1201-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A number of ion beam accelerators are being used in this laboratory to study charge transfer, ionization and excitation in ion-atom collision processes at energies ranging from ~ 100 eV to 2500 keV. Techniques include beam-static gas target, intersecting beam and both optical and energy loss/gain spectroscopy. Collisions involving hydrogen atoms are of particular interest. Some of the measurements are relevant to the diagnostics and modelling of high temperature plasmas in magnetic confinement devices and to schemes to promote inertial fusion by heavy ions. (37 refs.)
- 61700 Applications of recent measurements of low energy charged particles induced nuclear reactions on light nuclei.** F.E.Cecil (Dept. of Phys., Colorado School of Mines, Golden, CO, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1205-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The author discusses the applications of these reactions to the general problem of the diagnostics of charged and neutral particle beams and of high temperature deuterium and tritium plasmas. The motivation for these applications lies primarily in the crucial role which such beams and plasmas occupy in the contemporary CRT development effort. (4 refs.)
- 61701 On the observability of forbidden lines.** S.O.Kastner, A.K.Bhatia (NASA, Goddard Space Flight Center, Greenbelt, MD, USA). *J. Quant. Spectrosc. & Radiat. Transfer (GB)*, vol.29, no.4, p.369-74 (April 1983).
The disappearance of forbidden lines for O III at intermediate plasma densities may be due to background wing emission of the stronger allowed lines, rather than to Stark broadening of the forbidden lines as suggested recently. The general conclusion is supported that the classical explanation of quenching is erroneous, at least for O III. (6 refs.)
- 61702 Line radiation of highly ionised impurities in plasma produced in the plasma-focus device.** S.Czekaj, W.Kozarkiewicz, W.Skrzeczanski (S. Kaliski Inst. of Plasma Phys. and Laser Microfusion, Warsaw, Poland). *J. Tech. Phys. (Poland)*, vol.22, no.4, p.455-62 (1981).
The authors investigated the plasma spectrum within the X-ray range, and defined the plasma parameters, at the compression phase, on the grounds of an analysis of spectral lines of highly stripped neon, oxygen, nitrogen and carbon ions. The plasma was generated in the F-20 device of the plasma-focus type with bank of capacitors energy equal to 12.5 kJ, and 1.5 Tr pressure of the neon-admixed deuterium. (12 refs.)
- 61703 High-frequency Stark-effect measurements in emission spectroscopy.** N.J.Wiegart (Inst. für Experimentalphys., Ruhr-Univ., Bochum, Germany). *Phys. Rev. A (USA)*, vol.27, no.4, p.2114-19 (April 1983).
The applicability of the high-frequency Stark effect in the diagnostics of turbulent plasmas is demonstrated by measurements of He I line profiles (4^1D-2^1P) in a turbulent linear discharge. The existence of electron plasma waves with field strengths of 6-9 kV/cm is confirmed spectroscopically. Competing effects—e.g. the emission of molecular lines—are discussed in detail and are shown to be negligible under the experimental conditions. (25 refs.)
- 61704 Spectra of highly ionized atoms in hot plasmas: conditions for production and observation.** E.Ya.Kononov (Inst. for Spectroscopy, Acad. of Sci. Troitsk, USSR). *Phys. Scr. (Sweden)*, vol.27, no.2, p.117-24 (Feb. 1983).
Excitation conditions for spectra of highly ionized atoms in the low inductance vacuum spark and laser produced plasma are discussed in this review from the viewpoint of obtaining accurate numerical data on energy structure of electron shells. Some optimum observation conditions and data acquisition methods are suggested. (27 refs.)
- 61705 Space plasma diagnostics.** M.S.Agarwal (Dept. of Electrical Engng., Indian Inst. of Technol., Bombay, India). *Vac News (India)*, vol.13, no.3, p.13-17 (Sept. 1982). [received: March 1983]
The author describes some of the techniques employed for the identification of constituent elements and measurement of charged particle densities and energies, and the magnetic fields. The techniques discussed are electric and magnetic probes, spectral spectroscopy, RF interferometry and mass spectrometry. To test and calibrate the apparatus and devices used, many conditions of space plasma may very closely be simulated in laboratory through vacuum and low-pressure gaseous discharges. Some experimental results are presented and interpretations given. (8 refs.)

61706 The temperature distribution in a MHD plasma channel. I.Dogaru, Rev. Roum. Sci. Tech. Ser. Electrotech. & Energ. (Rumania), vol.28, no.1, p.85-8 (Jan.-March 1983). In French.

Calculates the temperature field distribution inside a metallic electrode (ceramic insertion) in the stationary state without heat sources. The finite difference method is used to integrate the heat conduction equation. As an example, an inoxidisable steel electrode in ZrO_2 , Al_2O_3 and CSI are considered for different geometries. The results are applicable to magnetohydrodynamic plasma channels. (4 refs.) L.A.F.

61707 Axial and angular distribution of current density in a thermionic converter with nonisothermal electrodes. A.D.Volkov, V.A.Ruzhnikov, P.P.Scherbinin.

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1082-4 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1763-6 (Sept. 1982). [received: April 1983]

The results are presented of an experimental and theoretical study of the current-density distribution along an incandescent cylindrical emitter of a low-voltage arc discharge in cesium. It is shown that far from the minimum of the S-shaped curve describing the dependence of the emission current on the emitter temperature T_E , the current profile on its descending part coincides with the profile of the emitter temperature and varies inversely near the minimum of the S-shaped curve. An interpretation of this result is given. The azimuthal distribution of the current was measured with an anode made up of angular sections. The profile was found to be nonuniform; the character of the nonuniformity in the nonarcing regime changes during the transition from an undercompensated to an overcompensated discharge, which indicates that the emitter temperature is not uniform with respect to angle (the angular profile of T_E was not measured). The calculated profile of the current density along the emitter coincided with the experimental profile, which confirms the validity of the principle of additivity in the arc regime. (10 refs.)

61708 Experience of T-7 operation in plasma experiments. D.Ivanov, B.Staviskij (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1087-93 vol.2

On the ground of 3-year operation experience the analysis of serviceability of the basic constructive designs of superconducting magnetic system, vacuum chamber, cryostat and poloidal coils are carried out. The operating results of cryogenic system are discussed. Some specific peculiarities of plasma experiments in Tokamak with superconducting toroidal field coils are pointed out. (2 refs.)

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1185-9 vol.2

A high-magnetic field Tokamak is designed for plasma heating experiments by adiabatic compression of plasma over major and minor radii. Neutral beam injection heating is also used. The plasma position and current control system includes a diagnostic facilities with preliminary signal processing, an automatic control system, a computer with interface, power supplies and ohmic heating coil, compression coil, equilibrium coils for the first and second discharge stage, vertical and horizontal field correction coils. Combined adaptive program control and feedback loops are used. (no refs.)

61710 Plasma parameter control experiments on 'Tuman-3'. V.A.Belyakov, S.E.Bender, S.N.Vasil'ev, S.V.Gornostaev, N.M.Efremenko, A.G.Kolchin, Yu.A.Kostov, R.N.Litunovsky, O.A.Minyayev, P.P.Teplov (D.V. Efremov Sci. Res. Inst. of Electrophys. Apparatus, Leningrad, USSR), V.E.Golant, M.P.Gryaznevich, S.V.Lebede, N.V.Sakharov, K.G.Shakhovets, A.A.Fedorov.

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1191-5 vol.2

The Tokamak 'Tuman-3' is designed for plasma compression experiments in a time-rising toroidal magnetic field. The Tokamak features are large aspect ratio ($R/a=2.3$), nearness of the iron core to the plasma region and low time constant of the vacuum chamber (0.15 ms). Feedback plasma position control improves essentially discharge repetition, makes easier to obtain operation conditions, allows to vary gas injection without breaking the equilibrium. The combined gas-discharge chamber cleaning, equilibrium control and programmed pulsed gas injection result in MHD-stable discharges with low safety factor (up to 2.2). The vertical plasma shift does not exceed 0.5 cm at the plasma current front and 0.2 cm at the stationary discharge stage. The horizontal plasma shift is within 0.2-0.5 cm. Further development of the control system includes the plasma current control system, density control and that of current profile and MHD-column activity level. Some experiments are conducted in 'Tuman-3' to study the effect of chamber cleaning, gas injection, additional heating etc. on discharge repetition and plasma parameters. (2 refs.)

61711 T-15 poloidal field control system. V.A.Belyakov, V.G.Ivkin, A.V.Kuznetsov, R.N.Litunovsky, I.V.Mozin, V.P.Smirnov, A.M.Stolov, P.P.Teplov (D.V. Efremov Sci. Res. Inst. of Electrophys. Apparatus, Leningrad, USSR).

Fusion Technology 1982. Proceedings of the Twelfth Symposium, Julich, Germany, 13-17 Sept. 1982 (Oxford, England: Pergamon 1983), p.1209-13 vol.2

The T-15 poloidal field control system is designed on the basis of experimental investigations, made on the Tokamak 'Tuman-3' and numerical modeling data. The purpose of the calculations is to investigate the plasma position and current control system, preparation of program motion correction algorithms for the mathematical model chosen, and determination of the requirements to the fast control loop. The control of horizontal plasma column position is constructed as a combination of an adaptive program feedforward and a fast feedback with controlled parameter. A counterturn scheme is used in the 'fast' coil and it is weakly coupled with other poloidal field coils. The poloidal field control system includes also the control of the plasma current and vertical position according to the given program. During the discharge continuous data acquisition on plasma parameters is made. During dwell time the information is processed in the TPA 1140 computer. On the basis of the data obtained, the power supply operation programs are corrected up to the moment of the next discharge. (no refs.)

52.80 ELECTRIC DISCHARGES

(see also 51.50 Electrical phenomena in gases)

61712 Lightning and switching impulse breakdown of rod/plane gaps in nitrogen and nitrogen/freon (CCl_2F_2) mixtures. T.V.Babu Rajendran, C.S.Lakshminarasimha, M.S.Naidu (Dept. of High Voltage Engng., Indian Inst. of Sci., Bangalore, India).

IEE Proc. A (GB), vol.130, no.3, p.134-9 (May 1983).

Lightning impulse (1.2/50 μs) and switching impulse (200/2000 μs) breakdown phenomena in nitrogen and nitrogen/freon mixtures have been investigated for rod/plane gaps at total pressures up to 5 bar and spacings up to 100 mm with freon concentrations varying from 1 to 20% in the mixture. Results of breakdown voltages show that, in general, substantial improvement in breakdown strength can be achieved, particularly for negative polarities with the addition of small percentages (\sim a few per cent) of CCl_2F_2 to N_2 . It is of interest to note that the characteristic 'pressure effect' in the positive point breakdown voltage against pressure curve observed in many strongly attaching gases is ill defined in these mixtures, and can be seen only over a limited range of experimental conditions. The corresponding effect for negative

point breakdown is observed in these mixtures at the relatively low pressures of 2 to 4 bar for long gaps (>40 mm). The breakdown voltages for a 100 mm gap with the switching impulse at pressures greater than 2 bar are generally 20% lower than the corresponding lightning impulse data. (19 refs.)

61713 Anomalous electron attachment properties of perfluoropropylene ($1-\text{C}_3\text{F}_6$) and their effect on the breakdown strength of this gas. S.R.Hunter, L.G.Christophorou, D.L.McCorkle, I.Sauers, H.W.Ellis, D.R.James (Health & Safety Res. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

J. Phys. D (GB), vol.16, no.4, p.573-80 (14 April 1983).

Electron attachment to perfluoropropylene ($1-\text{C}_3\text{F}_6$) in $1-\text{C}_3\text{F}_6$ /buffer gas mixtures has been found to be anomalously dependent on both the $1-\text{C}_3\text{F}_6$ and buffer gas pressures, as well as on the gas temperature. The authors have found also that the uniform field breakdown strength of pure $1-\text{C}_3\text{F}_6$ is dependent on gas pressure but not on the gas temperature. A mass spectrometer study of the negative ions formed in a moderately high pressure corona discharge has been made, and the principal negative ions formed by electron attachment to $1-\text{C}_3\text{F}_6$ have been identified. Based on these studies, a reaction scheme for electron attachment to $1-\text{C}_3\text{F}_6$ is proposed which results in stable negative ion clusters but does not involve pre-existing dimers. Further, the authors propose that the observed pressure dependence in the breakdown strength of this gas is due to the large pressure dependence of the electron attachment process they observed. (29 refs.)

61714 Calculation of swarm parameters in xenon at high E/N by a Monte Carlo simulation method. M.Hayashi (Nagoya Inst. of Technol., Nagoya, Japan).

J. Phys. D (GB), vol.16, no.4, p.591-9 (14 April 1983).

Swarm parameters (electron drift velocities, ratios of electron radial diffusion coefficient to mobility, mean electron energies and electron energy distribution functions) have been calculated in xenon by a Monte Carlo simulation method. Values of these parameters have been obtained for ratios of the electric field to the gas number density E/N from 85 to 8500 Td ($E/p_0 = 30 \sim 3000$ V cm $^{-1}$ Torr $^{-1}$ at 0°C). Calculated results were compared with available experimental and other calculated data. Calculations relating to the non-equilibrium distance d_0 in front of the cathode and non-equilibrium distance near the anode were also carried out. For these calculations, elastic momentum transfer cross-sections and inelastic cross-sections up to 10^4 eV reported in the author's preceding paper (see *ibid.*, vol.16, p.581-9, 1983) were used. (19 refs.)

61715 Possible explanation of the mechanism of cathode spot motion. A.V.Zharinov, Yu.V.Sanochkin (V.I. Lenin All Union Electrical Engng. Inst., USSR).

JETP Lett. (USA), vol.36, no.5, p.182-5 (5 Sept. 1982). Translation of: *Pisma v Zh. Eksp. i Teor. Fiz. (USSR)*, vol.36, no.5, p.147-9 (5 Sept. 1982). [received: April 1983]

A thermal capillary mechanism for cathode spot motion is proposed. The velocity of the spot is determined and the convection pattern is examined. (3 refs.)

61716 Time scale considerations on the relaxation of electronic and vibrational energy distributions in a nitrogen afterglow. M.Capitelli, C.Gorse (Dipartimento di Chimica, CNR, Bari, Italy), A.Ricard.

J. Phys. Lett. (France), vol.44, no.7, p.L251-6 (1 April 1983).

The relaxation of the electron energy distribution function (edf) in vibrationally excited N_2 post discharges has been analysed by discussing the characteristic times necessary for 'edf' to achieve and maintain a quasistationary state and by comparing these times with other important times corresponding to electron losses by dissociative recombination and diffusion to the tube wall. The calculated results show that the vibrational collisions can create a quasistationary 'edf' in times of 10^{-7} - 10^{-6} s ($p = 5$ torr, $T = 500\text{K}$). This quasistationary state is characterised by a strong correlation between vibrational distribution and mean electron energy. It can last up to several 10^{-3} s till the electron density becomes too small as a result of recombination and diffusion. Comments of some earlier experimental results are given. (14 refs.)

61717 Monte Carlo calculation of the erosion rate and ion current at a vacuum arc cathode. V.A.Nemchinskii (All-Union Sci. Res. Inst. for Current Source Design & Technol., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1073-7 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1748-55 (Sept. 1982). [received: April 1983]

The Monte Carlo method is used to calculate the trajectories of particles vaporized from a vacuum arc cathode. Ionization and collisions between atoms, ions, and electrons are all treated. The atomic and ionic density, velocity, and temperature distributions are calculated along with the electric field in the plasma near the cathode. The number of vaporized particles subsequently returning to the cathode as neutrals or ions is determined. Electron-ion friction and electric field effects are shown to greatly increase the number of particles returning to the cathode. However, the returning particles are ionized only if the vaporized atoms can be ionized over distances a few times collision length in the plasma. If this condition is not satisfied, only neutral atoms return to the cathode and there is a large voltage drop in the quasineutral plasma comparable with the cathode drop. (2 refs.)

61718 Numerical modeling of a laminar pulsed discharge including radiative transport. G.S.Romanov, A.S.Smetannikov (Res. Inst. for Appl. Phys. Problems, State Univ., Minsk, Belorussian SSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1078-81 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1756-62 (Sept. 1982). [received: April 1983]

A system of MHD equations describing the dynamics of the evolution of a discharge having cylindrical symmetry was solved together with the radiation transport equations averaged over the spectrum in prescribed spectral intervals, in the 'forward reverse' approximation (along a normal to the symmetry axis). The calculations were performed for a cylindrical aluminum foil in air for two-sided (along the radius) and one-sided (towards the symmetry axis) expansion of the high-temperature vapor of the foil. The discharge energy per unit length was 8.5 kJ/cm, and the cylinder radius and wall thickness were 9 and 6 μm , respectively. The radiation-gasdynamic parameters of the discharge were determined; it was found that the energy radiated in the photon energy spectral interval 0.6-5 eV and in a time ~ 100 μs was $\sim 30\%$ in the first case and 40% in the second. Comparison of the calculation results with the published experimental data has shown them to be in fair agreement. (16 refs.)

61719 Glow discharge in a transverse magnetic field. V.N.Glazunov, V.G.Grechany, A.S.Metal' (V.I. Lenin All-Union Electrotech. Inst., USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1084-7 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1767-72 (Sept. 1982). [received: April 1983]

The authors have determined the characteristics of a stationary rod-cathode glow discharge in helium and argon in the pressure range 10^{-2} - 10 torr in a magnetic field up to 16 kA/m and a current density at the cathode up to 10 mA/cm 2 . The authors have shown that in the range of parameters where the

length of the trajectory of oscillating primary electrons from the cathode to the first reversal point in the cathode fall region is less than half their ionization length—the part of the path along which the probability of their ionizing atoms of the working gas is different from zero—the properties of the discharge are similar to those of a hollow-cathode glow discharge. (9 refs.)

61720 Velocity of anode vapor in pulsed vacuum breakdown. R.B.Baksh, N.A.Ratakhin, N.A.Kablambayev (Inst. of High-Current Electronics, Acad. of Sci., Tomsk, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1091-3 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1778-82 (Sept. 1982). [received: April 1983]

The establishment of steady-state evaporation of the anode invacuum breakdown is discussed. It is shown that the vapor velocity is determined as the velocity with which a gaseous sphere with internal energy equal to $2 kT_{\text{sur}}$ expands into vacuum. The temperature T_{sur} is determined by the balance between the energy release of the electron beam in the anode material and the energy loss due to evaporation. Experimental and calculated data are compared. (10 refs.)

61721 Effect of stepwise excitation processes on the electron velocity distribution function in argon. I.Yu.Baranov, N.B.Kolokolov (A.A. Zhdanov State Univ., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1096-9 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1787-93 (Sept. 1982). [received: April 1983]

For the first time the distortion of the electron velocity distribution function by stepwise excitation processes has been observed experimentally. The measurements were performed in an argon plasma afterglow at pressures of 0.6 and 0.4 torr with current pulses of 7, 13, and 65 mA in a 30 mm diameter discharge tube. The experimental results were compared with the distribution function calculated in local and nonlocal approximations. A criterion is given for estimating the contribution of stepwise processes to the form of the distribution function. (8 refs.)

61722 Production of a bulk discharge in an electronegative gas mixture. E.P.Bel'kov, P.N.Dashchuk, Yu.I.Kozlov, A.K.Piskunov, Yu.V.Romanenko, G.L.Spichkin (Kalinin Polytech. Inst., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1100-3 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1794-801 (Sept. 1982). [received: April 1983]

Experimental results are presented on the conditions for production of a stable bulk discharge stabilized by dielectric barriers in mixtures of SF_6 and helium in the chamber with a working gap of 2-3 cm. The voltage-characteristics have been used to determine the specific energy deposition in the discharge. In mixtures at atmospheric pressure containing 1-8% SF_6 , the specific deposition was $5\text{--}10 \text{ mJ.cm}^{-2}$. The deposition depends strongly on the matching between the output parameters of the generator and the parameters of the discharge chamber. (3 refs.)

61723 The effect of the method of treatment of a molybdenum cathode on the normal cathode drop in a glow discharge. P.N.Chistyakov (Engng.-Phys. Inst., Moscow, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1160-1 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1888-90 (Sept. 1982). [received: April 1983]

The normal cathode potential drop U_n in a glow discharge is determined by the nature of the gas and the material of the cathode. To obtain values of U_n that are reproducible and stable with time in an inert gas requires that the surface of the cathode be atomically clean and the inert gas be highly purified. The object of this work was to obtain a reproducible and stable value of U_n for a molybdenum cathode in neon with the use only of electron and electrothermal treatment to provide just as clean experimental conditions as does ion treatment in an inert gas flow discharge. The results of using both kinds of treatment are compared and it is found that the effect of ion bombardment in an inert gas on the value of U_n is due to the embedding of neon ions into the crystal lattice of molybdenum. (3 refs.)

61724 Dynamics of the cathode layer in an externally maintained glow discharge. A.N.Lobanov, Ya.I.Londer, L.P.Menakhin, K.N.Ul'yanov (V.I. Lenin All-Union Electrotech. Inst., Moscow, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1204-8 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1959-65 (Oct. 1982). [received: April 1983]

The behavior of the cathode layer in an externally maintained glow discharge is examined by numerically solving a self-consistent system of nonstationary gas-dynamic equations together with the continuity equation for the current and the Poisson equation for the electric field. The time dependence of the cathode voltage drop has been measured and found to be in agreement with the calculated value. (14 refs.)

61725 Study of a high-power quasisteady discharge at megampere currents. B.P.Giterman, D.I.Zenkov, A.I.Pavlovskii, N.N.Petrov, E.N.Smirnov, G.M.Spirov.

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1218-20 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1983-6 (Oct. 1982). [received: April 1983]

A discharge powered by a capacitor bank (stored energy 1.8 MJ) in an air-xenon mixture is studied experimentally. The maximum amplitude of the discharge current was 1.3 MA and the half-period of the discharge current was 250 μs . The brightness temperature was 26.10^3 K and the discharge was stable for $\sim 100 \mu\text{s}$. It is shown that even at MA currents the discharge converts electrical energy to light efficiently. (6 refs.)

61726 Several features of the free glow discharge. V.N.Melekhin, S.A.Mishin, N.Yu.Naumov (Inst. of Phys. Problems, Acad. of Sci., Moscow, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.400-1 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.923-6 (Aug. 1982). [received: April 1983]

The normal glow discharge in free space, not bounded by the walls of a discharge tube, has several interesting properties. These properties are conveniently observed for a cylindrical electrode geometry, with the discharge occurring between a round rod cathode 5-10 mm in diameter and a coaxial cylindrical anode a few centimeters in diameter. At an air pressure of 1-10 torr and at a discharge current of the order of a milliamper, the discharge is steady, with a cathode spot (the negative glow) having a characteristic saddle shape and drifting slowly along the cathode surface, undergoing a displacement in the azimuthal direction and also a displacement along the axis of the cathode, by 2-3 cm. (3 refs.)

61727 A study of underwater spark discharge characteristics under parametric variation of electric discharge circuits. A.I.Vorchenko.

Tekh. Elektrodin. (USSR), no.1, p.12-16 (Jan.-Feb. 1983). In Russian.

A mathematical model is proposed for calculating the characteristics of an underwater spark discharge. In contrast with existing models the proposed model takes into account the non-ideality of plasma in the determination of its electrical conductivity and ionization composition. Numerical methods are used to investigate the electrical and hydrodynamic characteristics of an electrical discharge in water and also the processes of emission of energy in the spark channel under a condition of parametric change in resistance, inductance and capacitance of the discharge circuit. It is shown that with the aid of the method examined it is possible to control the power characteristics of an underwater spark discharge, i.e. to shape pressure pulses of a complex predetermined form. 61728 Use of extinctions in programs for indexing powder patterns. V.P.Serykh (Physicotech. Inst. of Acad. of Sci., Ukrainian SSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.596 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.994 (Sept.-Oct. 1982). [received: April 1983]

Enlistment of the extinctions characteristic of the given crystal system enables one to make an additional selection of indices. Thus in the author's one of the calculated values Q_{101} and Q_{011} can be deflected owing to its failure to correspond to the extinctions of a face-centered monoclinic unit cell. The extinctions may conveniently be reduced to a two-dimensional array, the rows of which correspond to the diffraction groups, and the columns to be assigned number of the rule by which the generated indices are verified. Reliable operation of the algorithm should be ensured if the test is begun with groups with more complicated extinctions. (3 refs.)

61729 Graphical derivation of the several settings of an orthorhombic crystal. M.J.Buerger (MIT, Cambridge, MA, USA).

Z. Kristallogr. (Germany), vol.161, no.1-2, p.119-26 (1982).

A simple graphical method for deriving the various settings of an orthorhombic crystal from what has been called the 'standard' setting is briefly discussed. The 'standard' setting is not necessarily the most useful one to use when a crystal is to be oriented according to the relative dimensions of its three cell translations. (no refs.)

61731 Improved system for energy-dispersive X-ray diffraction with synchrotron radiation. E.F.Skelton, S.B.Qadri, A.W.Webb, C.W.Lee, J.P.Krikland (Stanford Synchrotron Radiation Lab., Stanford Univ., Stanford, CA, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.4, p.403-9 (April 1983). A number of improvements in a facility developed over the past three years at the Stanford Synchrotron Radiation Laboratory for the study of pressure and/or temperature effects on materials are described. These include improved beam collimation to both reduce background and eliminate gasket scatter, a remote, pneumatically operated pressurizer, and introduction of a variety of electronics hardware to allow both computer control of experiments and on-line data analyses. Considerations are given to the possible effects of heating of the pressure cavity by the incident beam and to possible fluctuations of the incident beam intensity/energy profile. In both cases, there was no evidence to indicate that these phenomena warranted any further consideration, i.e. they are not considered to be problems in terms of analyzing the data. Extended measurements of a well-defined diffraction peak indicated that a considerable improvement over the authors' earlier work has been realized in terms of the precision in the determination of the energy of the peak, viz. a precision of better than 0.04% for measurement periods as short as 10 s; the estimated precision in the net peak area is less than 3%. The system was used to examine the kinetics of the B1-to-B2 pressure-induced phase transition in KBr. The volume change in the two-phase region is measured to be $10.41\% \pm 0.10\%$, in excellent agreement with most of the previous measurements. A plot of the time dependence of the growth rate of the high-pressure phase indicates that the phase transformation can be described by the Avrami equation. Constants for the phase transition kinetics are given. (27 refs.)

61732 Reconstruction of the electron density of a partly determined structure. D.I.Kalinin (Inst. of Appl. Math., Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.27, no.5, p.521-6 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.867-75 (Sept.-Oct. 1982). [received: April 1983]

The author investigates the form of the function $\rho_e(x)$, synthesized from Fourier coefficients, the moduli of which are the moduli of the Fourier coefficients of the true electron density of a crystal structure $\rho_c(x)$, while their phases are the phases of the Fourier coefficients of the density of a model, $\rho_m(x)$, imitating part of this structure, without the imposition of any limitations on the form of the functions $\rho_c(x)$ and $\rho_m(x)$. (6 refs.)

61733 Use of an iteration method to eliminate instrumental factors from experimental spectra obtained in diffractometers from weakly absorbing materials by the reflection method. V.F.Pleshakov (All-Union Sci.-Res. & Design-Technol. Inst. of Electrocarbon Products, USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.27, no.5, p.527-9 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.876-80 (Sept.-Oct. 1982). [received: April 1983]

The author solves the problem of finding the true spectrum from the integral equation by the method of iterations. The method is used to eliminate instrumental distortions from an experimental spectrum obtained from vitreous carbon treated at 2500°C. The method used to eliminate the instrumental factors is shown to be precise and efficient. Very weak reflections are clearly shown up in the intensity curves and interference function at $s=0.39, 0.735, 1.04, 1.085, 1.22, \text{ and } 1.27 \text{ \AA}^{-1}$. The results are compared with the solution of the integral convolution equation, in which the (004) reflection of graphite is used as the instrumental function. It is shown that the convolution equation is ineffective for eliminating instrumental distortions with the aim of showing up weak reflections and investigating the fine structure of carbon materials. (11 refs.)

61734 Polarization of X-rays in the region of the Bragg reflection curves of silicon crystals with dislocations. N.M.Olekhovich, V.L.Markovich, A.I.Olekhovich (Inst. of Solid State Phys. & Semiconductors, Acad. of Sci., Belorussian SSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.533-5 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.886-90 (Sept.-Oct. 1982). [received: April 1983]

This article gives the results of investigations of the polarization factor P_R of X-rays of Bragg reflections from single crystals of silicon with various dislocation densities N_d . From the character of the angular dependence of P_R , the region of applicability of the mosaic model of the crystal is determined ($N_d \geq 10^4 \text{ mm}^{-2}$), and it is shown that scattering in mosaic crystals is governed by dynamic scattering in individual blocks and that secondary extinction does not take place. (15 refs.)

61735 Dynamic focusing of hard X-rays with transverse dispersion $D_s=0$. K.T.Gabrielyan, F.N.Chukhovskii (State Univ., Erevan, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1309-10 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2127-8 (Oct. 1982). [received: April 1983]

The authors' goal was to show that under certain conditions, when the transverse dispersion D_s of the diffracted X-rays is zero, chromatic aberration can be suppressed and dynamic X-ray focusing improved using elastically bent crystals. The findings are reported for the case of symmetric Laue diffraction of X-rays in a crystal bent without distortion of its cross section. (6 refs.)

61736 On the visibility of small metallic particles on crystalline substrates. M.Avalos-Borja (Dept. of Materials Sci. & Engng., Stanford Univ., Stanford, CA, USA), M.J.Yacaman.

Ultramicroscopy (Netherlands), vol.10, no.3, p.211-15 (1982). Dynamical diffraction theory was used to study the contrast of small metallic particles supported on crystalline substrates. The dependence of the particle visibility on the orientation and thickness is discussed. Experimental examples

of changes in particle visibility for Pt/alumina and Pt/sapphire are presented. (5 refs.)

61.14F Experimental diffraction and scattering

61737 Interpretation of the fading of diffraction patterns from organic substances irradiated with 100 keV electrons at 10-300K. L.Reimer, J.Spruth (Phys. Inst., Univ. Munster, Munster, Germany).

Ultramicroscopy (Netherlands), vol.10, no.3, p.199-210 (1982). The fading curves of Debye-Scherrer ring intensities have been recorded for evaporated films of some aliphatic and aromatic compounds at temperatures between $T_s=14-66\text{K}$ and room temperature. The lowest real specimen temperature T_s was calibrated by the condensation of different gas atoms and depends on the current density used, which has to be raised with increasing resistivity to radiation damage. The fading curves for the lowest specimen temperature were compared with a theory of Clark et al. (1980) modified by a multiple-hit model. By fitting the theory to experimental results, values of the cross-section σ for a single hit, the mean number m of hits necessary to destroy a sensitive unit and the ratio b of the damaged to the undamaged structure amplitude of a unit cell can be established. There are considerable differences in these quantities for different compounds. The temperature dependence of σ for tetracene and other compounds can be explained by an activation energy of the order of a few tens of one meV. (24 refs.)

61738 A comparison of techniques for obtaining convergent beam electron diffraction patterns with a JEOL 200CX. K.C.Lee (School of Appl. & Engng. Phys., Cornell Univ., Ithaca, NY, USA).

Ultramicroscopy (Netherlands), vol.10, no.3, p.217-22 (1982). Three different techniques for obtaining convergent beam electron diffraction (CBED) patterns using a JEOL 200CX transmission electron microscope are described and compared. The first technique, described by Goodman (1964), are shown to yield clear, undistorted patterns, but only with relatively large camera length, and a limited field of view. A second technique, which is a modification of Goodman's technique, is shown to yield CBED patterns of both large camera length and small camera length with a much larger angular coverage, but the magnitude of the beam convergence is limited by distortion in the pattern. A third technique is then presented which permits the formation of small camera length, relatively undistorted CBED patterns with large angular coverage and greatly increased beam convergence; high quality large camera length CBED patterns can also be obtained by simply increasing the strengths of the diffraction lenses. (7 refs.)

61.14H Low-energy electron diffraction (LEED) and reflection High-energy electron diffraction (RHEED)

61739 Model for intensity correction of high energy electron diffraction of small crystallites on solid surfaces. E.Muller (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany).

Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.31, no.6, p.1073-83 (1982). In German.

Using the kinematical theory of diffraction a simple model was derived allowing one to correct the intensities of electron diffraction patterns of small crystallites on solid surfaces, observed on RHEED, as a function of the angle of inclination and diffraction, respectively. Other parameters are the mean radius of the particles, assumed as semispheres, their mean distance, the wavelength, the extinction coefficient, and a parameter of the diffraction spot halfwidth. This correction function by which the theoretical scattering factors have to be multiplied generally shows a non-monotonous behaviour. The influence of the various parameters on the intensity distribution is discussed. (4 refs.)

61.16 OTHER DETERMINATION OF STRUCTURES

(for specific determinations, see 61.55 to 61.80)

61.16D Electron microscopy determinations

61740 Visualization of Bloch waves of high energy electrons in high resolution electron microscopy. K.Kambe (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).

Ultramicroscopy (Netherlands), vol.10, no.3, p.223-7 (1982). By applying the Bloch wave theory of electron diffraction to the problem of lattice images in high resolution electron microscopy, it is shown that those characteristic types of images as found for Ge(110) can be interpreted as images of individual Bloch waves formed by the incident electron inside the lattice. (3 refs.)

61741 Effect of the phase shift due to dynamical scattering on the contrast of crystal structure images. S.Horiuchi (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).

Ultramicroscopy (Netherlands), vol.10, no.3, p.229-35 (1982). The contrast of through-focus images of a niobium tungsten bronze, $2\text{Nb}_2\text{O}_5 \cdot 7\text{WO}_3$, taken by a 1 MV high resolution electron microscope, is discussed in terms of the transfer function, in which, in addition to the conventional phase aberration, the phase shift due to the dynamical scattering is taken into account. It is found that the phase shift may be advantageous in the formation of structure images, as long as the crystal is very thin, i.e. a few nanometers in thickness. It is also made clear why the best defocus for optimum structure images differs from the Scherzer defocus, depending on the crystal thickness. An almost exact contrast reversal occurs at overfocus only in the images of extremely thin crystals, because the positive range of the transfer function is made narrower due to the above phase shift. The discussion is supported by computer simulation of the image contrast. (20 refs.)

61742 Direct interpretation of high resolution electron images of substitutional alloy systems with a column structure. D.Van Dyck, G.Van Tendeloo, S.Amelinckx (Univ. Antwerpen, Antwerpen, Belgium).

Ultramicroscopy (Netherlands), vol.10, no.3, p.263-80 (1982). It is shown that in substitutional alloy systems with a column structure, high resolution electron micrographs viewed along the columns may still show a one-to-one correspondence with the atomic configurations even for crystal thicknesses beyond the thin phase grating limit. For such cases the atomic positions can be determined unambiguously from the images, without any need for image simulation. The required experimental conditions and the nature of the contrast are discussed. (7 refs.)

61.20 CLASSICAL, SEMICLASSICAL, AND QUANTUM THEORIES OF LIQUID STRUCTURE

(for kinetic and transport theory, see 51.10; for electronic states, see 71.; for liquid helium, see 67.)

- 61743 A modified Wigner function set for the Smoluchowski operator representation in anisotropic liquids. G.Moro, P.L.Nordio (Inst. of Phys. Chem., Univ. of Padua, Padua, Italy). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.2, p.192-9 (1 April 1983). The set of (non)orthogonal functions $D_{pq}^{(0)}(P)^{1/2}(\Omega)$, in which the Wigner rotation functions are multiplied by the equilibrium orientational distribution is shown to provide a convenient basis for the solution of the rotational diffusion problem in anisotropic liquids, in the entire range of orientational ordering. (17 refs.)

- 61744 van der Waals forces in solutions. V.V.Kuzii, V.I.Ryzhi. *Kolloid J. USSR (USA)*, vol.44, no.3, p.425-30 (May-June 1982). Translation of: *Kolloid. Zh. (USSR)*, vol.44, no.3, p.477-83 (May-June 1982). [received: Feb. 1983].

The densities of the van der Waals forces acting on dissolved substances, both in bulk solution and in a film of solution are obtained. They allow one to study the motion of dissolved substances in solutions. The density of van der Waals forces in the plane of a film of solution is used to calculate the energy of the van der Waals interaction of the atoms of a dissolved substance close to a bulk object. (5 refs.)

- 61745 On static dielectric function of simple ionic systems. M.F.Golovko, O.O.Pizio. *Dopov. Akad. Nauk UkrSR. Ser. A (USSR)*, no.2, p.47-9 (1983). In Ukrainian.

The static dielectric function is calculated for a model of charged hard spheres. It is shown to have the Debye asymptotics at large k in the entire thermodynamic parameter region. At small k in a certain region of thermodynamic parameters there is a branch of negative values which appeared due to changes of screening in the system. (10 refs.)

- 61746 On the use of the Ewald summation in computer simulation. D.J.Adams (Dept. of Chem., Univ. of Southampton, Southampton, England). *J. Chem. Phys. (USA)*, vol.78, no.5, p.2585-90 (1 March 1983). Monte Carlo calculations for the restricted primitive model at a point in the molten salt region have been made using a variety of summation methods. The empirical conclusion is that the Ewald summation is an excellent method for this work. It is shown that it does not produce significantly anisotropic pair distributions. It is shown that unlike some of the other methods considered it does not have a systematic bias towards lower energy for some configurations. It is argued that the shape of its effective pair potential does not lead to distortion of the melt structure. However, an approximate form of the Ewald summation is shown to produce significant distortions of the melt structure for the case examined. (25 refs.)

- 61747 Constant temperature molecular dynamics calculation on Lennard-Jones fluid and its application to water. H.Tanaka, K.Nakanishi, N.Watanabe (Dept. of Industrial Chem., Kyoto Univ., Kyoto, Japan). *J. Chem. Phys. (USA)*, vol.78, no.5, p.2626-34 (1 March 1983). Constant temperature molecular dynamics calculation has been carried out on Lennard-Jones liquid simulating argon. This method, proposed recently by Andersen (1980), intends to transform the system from microcanonical to canonical ensemble and to keep the temperature of the system a constant value by the generation of random velocities when molecules exchange their energies with heat reservoir with a certain probability. A simple scheme is given for the estimation of collision probability and the effect of introducing this probability on dynamic behavior is examined in detail for 108 argon atoms as a test simulation. It is established that a collision probability of 0.01 is sufficient to realize the constancy of temperature reasonably well with no appreciable disturbance in the dynamic behavior. A model of pure water with Matsuoaka-Clementi-Yoshimine (MCY) potential has also been simulated in the same manner. In the case of 216 MCY water at 298.15K, the temperature difference is only 0.73K with a collision probability of 0.005. Various static properties of MCY water have been calculated with reasonable agreement with those by previous Monte Carlo calculation, and moreover, the dynamic behavior calculated for MCY water gives a satisfactory picture on both translational and rotational motions in water, including reasonable agreement of diffusion coefficient with experimental datum. (21 refs.)

- 61748 A Monte Carlo study of semi-dilute hard sphere mixtures. P.H.Fries (Dept. de Recherche Fondamentale, CENG, Grenoble, France), J.-P.Hansen.

Mol. Phys. (GB), vol.48, no.5, p.891-901 (10 April 1983). The authors present Monte Carlo results for the high density equation of state and the partial pair distribution functions of semi-dilute solutions of large hard spheres in a solvent of smaller spheres. The simulation data for diameter ratios of 2:1 and 3:1 agree reasonably well with the predictions of Percus-Yevick theory and its semi-empirical modifications, except for the solute-solute pair distribution function. A free volume analysis of the equation of state data points to the existence of a well defined, concentration dependent, amorphous close packed density which is significantly higher than for a pure hard sphere fluid. (13 refs.)

- 61749 Virial-bias Monte Carlo methods. Efficient sampling in the (T, P, N) ensemble. M.Mezei (Dept. of Chem., City Univ. of New York, New York, NY, USA).

Mol. Phys. (GB), vol.48, no.5, p.1075-82 (10 April 1983). A new sampling technique is proposed for the isothermal-isobaric (T, P, N) ensemble Monte Carlo computer simulation. The new method selects the volume perturbations by using the partial derivative of the volume with respect to the internal energy. Test calculations on the Lennard-Jones fluid show significant improvements over the conventionally used method. (19 refs.)

- 61750 Information theory applied to time correlation functions in fluids.

J.G.Powles (Phys. Labs., Univ. of Kent, Canterbury, England). *Mol. Phys. (GB)*, vol.48, no.5, p.1083-92 (10 April 1983).

Information theory is used to predict the reorientational time correlation functions for a linear molecule in a fluid given only the moment of inertia and the mean squared torque. Comparison with 'exact' computer simulation results for a variety of fluids show that the method is remarkably successful—even when the torque is small. It is just as successful, for instance, as a much more elaborate memory-function perturbation theory which uses the same information. The method is quite general and can be usefully applied to any time correlation function. (19 refs.)

- 61751 Effective spherical potentials for molecular fluid thermodynamics.

M.S.Shaw, J.D.Johnson, B.L.Holian (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).

Phys. Rev. Lett. (USA), vol.50, no.15, p.1141-4 (11 April 1983).

Through a thermodynamic perturbation expansion, a new sphericalization procedure has been obtained for anisotropic molecular potentials. For N_2 the resulting fluid pressures and internal energies for the effective spherical potential differ at high densities by at most 1.5% from exact molecular-dynamics calculations for the anisotropic N_2 potential. Results at lower densities are comparably good. Preliminary results for CO_2 , an even more anisotropic molecule, are also excellent. (13 refs.)

- 61752 Perturbation theory of structure factors of fluids away from their triple points. M.Itoh (School of Math. Phys., Univ. of East Anglia, Norwich, England).

Physica B & C (Netherlands), vol.115 B+C, no.2, p.240-6 (Jan. 1983).

A diagrammatic technique is applied to develop a perturbation theory of the structure factor of fluids. The authors analyse and improve the mean density approximation (MDA) by Henderson and Ashcroft (1976) which is known, within first order perturbation, to give correct small- q behaviour of the strong temperature dependence of the structure factor away from the triple point. The improved formula seems to work well for large q -values. (12 refs.)

- 61753 On the difference between the short-range order structures in a crystal and a liquid. V.P.Skripov, A.E.Galashev (Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.577-9 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.961-5 (Sept.-Oct. 1982). [received: April 1983]

By means of a molecular-dynamic computer model, the authors obtain and compare the local structural characteristics of an FCC crystal and a liquid, for a substance of the argon type. In an analysis of the Voronogo polyhedra, together with timewise averaging, use is made of a statistical-geometrical approach. (8 refs.)

- 61754 On equilibrium properties of the multivalent ionic systems.

M.F.Golovko, O.A.Pizio, A.D.Trokhimchuk.

Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.411-17 (March 1983). In Russian.

A system of charged hard spheres with arbitrary valency is considered. It simulates molten salts and an ionic subsystem of electrolyte solutions. Binary distribution functions, internal energy and the equation of state are calculated. Specific features of a short-range ionic ordering in the systems are investigated. The transition from the region of the Debye screening corresponds to the ionic gas-ionic liquid phase transition. Critical parameters are calculated at various valencies. (11 refs.)

- 61755 Comment on 'Exact statistical mechanical relations for the cell model of polyelectrolyte solutions'. D.Brato (Dept. of Phys. Chem., Edvard Kardelj Univ., Ljubljana, Yugoslavia).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.263-5 (1 April 1983).

For original paper see H. Wennesström (J. Chem. Phys., vol.76, p.4665, 1982). An extension of the recent derivation of the osmotic equation for highly symmetrical models of polyelectrolyte solutions by Wennesström et al. is proposed, leading to a generalized expression valid also for models of lower symmetry. (14 refs.)

- 61756 Sulphate-H₂O interactions in a concentrated aqueous H₂SO₄ solution. R.Caminiti (Istituto di Chimica Fisica e Industriale, Univ. di Cagliari, Cagliari, Italy).

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.390-4 (8 April 1983).

X-ray diffraction data from a H₂SO₄ solution were examined. Peaks in the range 3-5 Å in the correlation function reveal the presence of sulphate-H₂O interactions. Each sulphate ion interacts with eight water molecules. A model of hydration similar to that present in the crystal structure of H₂SO₄·4H₂O is shown to be consistent with these results. (27 refs.)

- 61757 Chemical effects in diffusion and structure of zinc chloride in aqueous solution. A.J.Eastale (Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia), P.V.Giaquinta, N.H.March, M.P.Tosi.

Chem. Phys. (Netherlands), vol.76, no.1, p.125-8 (1 April 1983).

In the absence of neutron data, the authors have examined existing experimental data for X-ray, Raman scattering, EXAFS and thermodynamic activity studies in order to build up a consistent model of the structure of ZnCl₂ in aqueous solution in the range of molality from 2 up to saturation. The structure that emerges is that Zn is tetrahedrally coordinated and that in these coordination complexes the number of Cl ions per Zn ion increases with increasing molality, this implying the existence of extended Zn structures as the saturation concentration is approached. Relevant evidence in support of these structural models has been obtained by measuring the diffusion constants of Zn, Cl and H₂O when the stoichiometry of the solution is varied by replacing Zn by Li. This evidence strongly supports the model in which available Cl ions form complexes with Zn up to at least four Cl ions per Zn ion. (16 refs.)

- 61758 Equilibrium properties of molecular fluids with charge distributions of quadrupolar symmetry.** P.A.Monson, W.A.Steel (Dept. of Chem., Pennsylvania State Univ., University Park, PA, USA), W.B.Streett. *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4126-32 (15 March 1983). Molecular dynamics simulations are reported for dense fluids of molecules with discrete charge distributions of quadrupolar symmetry. The nonelectrostatic parts of the intermolecular potentials were modeled by Lennard-Jones site-site interactions with the two sites in each molecule separated by 0.547 σ , where σ is the distance scaling parameter in the Lennard-Jones function. The charge distributions were comprised of a double negative charge at the molecular center. The magnitudes and separation distances of the charges were varied so that changes in the thermodynamic, quasithermodynamic (mean square force and torque), and structural properties of the fluid could be determined at a fixed quadrupole moment. At finite charge separation distances the multiple expansion yields ideal quadrupole-quadrupole plus higher order interactions. It is shown that the observed changes in thermodynamic properties can be accurately calculated by including the next highest multipole interaction terms in the series; namely, the ideal quadrupole-hexadecapole energies (plus a small contribution from the hexadecapole-hexadecapole terms at the largest charge separations). A low order perturbation theory calculation of the changes in structural properties is also presented; it is found not to give satisfactory values for the observed changes in radial distribution function with charge separation distance. (14 refs.)
- 61759 The interioric potential of mean force in a molecular polar solvent from an extended RISM equation.** F.Hirata, P.J.Rossky, B.M.Pettitt (Dept. of Chem., Univ. of Texas, Austin, TX, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4133-44 (15 March 1983). The generalization of a recently proposed extension of the RISM integral equation to infinitely dilute isolated ions and ion pairs in polar, interaction site model, molecular solvents is outlined. An essential element of the development is the explicit separation of the contributions which yield a continuum dielectric solvent model from the remainder. Thus, it is only for this correction that one relies on the integral equation. Application is made to a system consisting of a diatomic polar solvent and atomic ions of varied charge and radius. The results of these calculations show that the present approach produces sensible qualitative features of ionic solvation including an appropriately varying degree of solvent orientational saturation with ionic charge and radius. Correspondingly, the calculated interioric potentials of mean force reproduce the same basic features manifest in already available studies of dipolar hard sphere solvents, including the positions of oscillatory features in the structure and the relatively short spatial range of the corrections to the continuum dielectric theory. A quantitative evaluation of the accuracy of the present predictions is not possible with presently available data. (33 refs.)
- 61760 Hydrogen bond dynamics in water studied by depolarized Rayleigh scattering.** O.Conde, J.Teixeira (Lab. de Phys. Thermique, Ecole de Phys. et Chimie, Paris, France). *J. Phys. (France)*, vol.44, no.4, p.525-9 (April 1983). The authors measured the depolarized Rayleigh light scattering by water from 80°C down to -17°C. The spectra obtained could be analysed into two lines, a broad and a sharp one. From the sharp line they deduced a relaxation time which can be interpreted as a reorientational time due to rotations. The broad line gives a relaxation time which is Arrhenius temperature dependent, with an activation energy $E=2.2$ kcal/mole. This shorter time can be associated with the mean lifetime of H-bonds in water and E is the activation energy of the formation and breaking of H-bonds process. This interpretation can be supported by recent measurements on quasi-elastic neutron scattering and by taking into account the librational frequencies from Raman spectroscopy. (18 refs.)
- 61761 The dynamics of water molecules in ionic solution.** N.A.Hewish (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England), J.E.Enderby, W.S.Howells. *J. Phys. C (GB)*, vol.16, no.10, p.1777-91 (10 April 1983). High-resolution neutron quasi-elastic scattering has been applied to the problem of aqueous solutions. It is shown that for ions for which the primary hydration shell is in slow exchange with the remaining water, the frequently used two-state model is not appropriate. The experiments provide unambiguous evidence that the dynamics of water molecules other than those in the first shell are affected by the presence of ions. (25 refs.)
- 61762 Ionic dynamics in molten salts.** T.Gaskell, M.S.Woolfson (Dept. of Phys., Univ. of Sheffield, Sheffield, England). *J. Phys. C (GB)*, vol.16, no.10, p.1793-8 (10 April 1983). By means of a velocity field approach, expressions are derived for the velocity autocorrelation functions of the two ionic species in a molten salt. The theory is applied to NaCl, giving results which are in satisfactory agreement with computer simulation data. In addition to coupling to the momentum density fluctuations, the single-particle motion is also coupled to the charge density fluctuations, with a coupling constant which is proportional to the ionic mass difference. The latter effect is more significant for the lighter ion. (11 refs.)
- 61763 The study of liquid germanium structure.** M.Davidovic, M.Stojic, D.Jovic (Boris Kidrich Inst. of Nuclear Sci., Belgrade, Yugoslavia). *J. Phys. C (GB)*, vol.16, no.11, p.2053-8 (20 April 1983). The static structure factor $S(q)$ of liquid germanium is determined at 1123K by neutron diffraction techniques in the range from 0.4 to 8.5 Å⁻¹. The structure factor shows a clear low-lying shoulder on the high side of the scattering angle, near the first peak of $S(q)$. These two peaks indicate a dual structure of the germanium melt. The first one characterises the short-range order and the 'irregular' one is associated with a certain degeneracy of the atomic states of the liquid around the imperfections of the structure, which appear as single vacancies. (24 refs.)
- 61764 Scaling theory of polymer adsorption: proximal exponent.** P.G.de Gennes (Coll. de France, Paris, France), P.Pincus. *J. Phys. Lett. (France)*, vol.44, no.7, p.L241-6 (1 April 1983). The authors interpret some recent calculations of Eisenriegler, Kremer, and Binder (see *J. Chem. Phys.*, vol.77, p.6296, 1982), and related multi-critical results of Diehl and Dietrich (see *Phys. Rev. B*, vol.24, p.2878, 1981). They show that the monomer concentration profile $\phi(x)$ for isolated polymer chains in a good solvent and in close proximity to an adsorbing wall exhibits a singular behaviour; i.e. $\phi(x) \sim (a/x)^m$, where a is a monomer dimension and $m=1/3$. Taking into account the proximal exponent m , the authors correct earlier scaling results for the interfacial tension of semi-dilute polymer solutions in good solvents. They also find good agreement with a recent result by Ishinabe (1982) on the single chain energy. (13 refs.)
- 61765 Study of the short-range order of liquid polytetramethylene glycol.** V.V.Shilov, N.E.Kruglyak, Yu.S.Lipatov (Inst. of Macromolecular Chem., Acad. of Sci., Kiev, Ukrainian SSR). *J. Macromol. Sci. - Phys. (USA)*, vol.B22, no.1, p.79-109 (1983). X-ray investigations of polytetramethylene glycol oligomers with various molecular weights were carried out. Interatomic distance correlation curves were obtained using the Fourier transformation of the intensity curves. Theoretical curves of the correlation of the intramolecular interatomic distances were also calculated. The calculation of these curves has been done using the results of conformational analysis for different conformational states of the PTMG chain. Correlation curves for the intermolecular distances were then obtained by subtraction of the theoretical curves from the experimental ones. The results obtained are considered in the framework of the various models of the structural state of liquid polymers. The model of kink isomers shows the best fit with the authors' results. (46 refs.)
- 61766 Properties of polyamide gels with varying chain stiffness and length synthesized in the swollen state.** S.M.Aharoni, D.H.Wertz (Corporate Res. & Dev., Allied Corp., Morristown, NJ, USA). *J. Macromol. Sci. - Phys. (USA)*, vol.B22, no.1, p.129-57 (1983). Cross-linked networks of rigid, semirigid, and flexible polyamides were polymerized in solution. When transferred to DMAc the volume of the rigid and semirigid networks did not change significantly, but the flexible networks swelled several hundred percent. When gels previously equilibrated in DMAc were immersed in mixtures containing increasing amounts of nonsolvent, they shrank by an amount that depended on chain flexibility: the flexible and semirigid gels shrank to 30% to 40% of their as-synthesized volume, while the rigid gels shrank to only about 60% of their as-synthesized volume. Furthermore, the volume of the rigid gel decreased smoothly with the change in solvent composition. Unlike that of the rigid network, the volumes of the semirigid and flexible gels sharply decreased over a rather narrow range of solvent composition. Semirigid gels prepared at lower polymer concentration shrank over a narrower solvent composition than their counterparts prepared at higher polymer concentration. All gels changed from transparent through translucent to opaque as they shrank. The slope of the deswelling curves and the developing turbidity indicate that the collapse of the networks is not a first-order transition. (24 refs.)
- 61767 Neutron diffraction studies of water. III. Structural change as a function of temperature.** I.P.Gibson, J.C.Dore (Phys. Lab., Univ. of Kent, Canterbury, England). *Mol. Phys. (GB)*, vol.48, no.5, p.1019-30 (10 April 1983). For pt.II see *ibid.*, vol.34, p.21 (1977). Neutron diffraction measurements have been made for heavy water at five temperatures in the range 11-75°C using the diffractometers D2 and D4 at ILL. A first-order difference method has been used to determine the change in the intermolecular contributions to the observed cross-section. Fourier transformation techniques are used to give the changes in the real space distribution function. The results confirm the preliminary observations obtained in an earlier experiment and give a more precise indication of the structural variation. A detailed analysis shows that the intermolecular OD separation which corresponds to an effective hydrogen bond distance increases as the temperature rises. At larger distances there is a systematic but more complex variation which may be attributed to a change in the relative orientations of neighbouring molecules. (26 refs.)
- 61768 Neutron diffraction studies of water in meso- and micro-pores.** D.C.Steytler, J.C.Dore (Phys. Lab., Univ. of Kent, Canterbury, England), C.J.Wright. *Mol. Phys. (GB)*, vol.48, no.5, p.1031-51 (10 April 1983). Neutron diffraction studies have been made for D₂O water in two high surface area silica samples, Spherisorb and Gasil. The results show that the structural arrangement is similar to that of bulk water and that the modification due to the interface is restricted to a range of the order of 10 Å or less. Measurements also indicate that the dispersed water undergoes significant structural changes with temperature variation but the behaviour is similar to that of the bulk liquid. The differences observed in the diffraction patterns can be partially described in terms of diffraction broadening due to the small volume of the dispersed water, but there remains a significant variation which appears to be related to the hydrogen bonding interactions. (28 refs.)
- 61769 A kinetic theory for polymeric fluids.** C.F.Curtiss (Dept. of Chem., Univ. of Wisconsin, Madison, WI, USA), R.B.Bird. *Physica A (Netherlands)*, vol.118A, no.1-3, p.191-204 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982). Molecular theories of polymeric fluids, both solutions and melts, have now been developed to a stage in which a broad class of nonlinear rheological phenomena may be described qualitatively and, in some cases, quantitatively. The theories contain several parameters, such as friction coefficients, chain length, and spring constants, that are determined by fitting data on rheological properties. The paper summarizes the development of these polymer kinetic theories, and particular attention is paid to the derivation of a rather general molecular theory expression for the stress tensor. The earlier dilute solution results of Kramers (1944), Risman and Kirkwood (1956), and Rouse, as well as the results of the reptation theory of Doi and Edwards (1978, 1979) for melts fit into this general development. (14 refs.)
- 61770 Dynamics of compatible polymer mixtures.** F.Brochard, P.G.de Gennes (Coll. de France, Paris, France). *Physica A (Netherlands)*, vol.118A, no.1-3, p.289-99 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982). Discusses the mutual diffusion of a compatible molten mixture A+B, assuming that the chains are flexible and relatively short (non-entangled). In the macroscopic limit the mutual diffusion coefficient D_m is predicted to be extremely large (independent of the molecular weights). When one goes to shorter wave vectors q two cross-overs occur: a) when the frequency $D_m q^2$ becomes larger than the fundamental Rouse time τ_r of a single chain, the coefficient D_m becomes q dependent, $D_m \rightarrow D_m(q) \sim q^{-2}$; b) when the spatial scales become smaller than the coil size R_0 ($qR_0 > 1$) the width $D_m(q)q^2$ becomes independent of q , and is comparable to a local relaxation rate. These predictions could be tested by a combination of photon beat and neutron quasi elastic scattering. (22 refs.)

61.25M Liquid metals

- 61771 X-ray investigation of the time dependence of liquid cast iron. B.A.Mel'nik. *Russ. Metall. (GB)*, no.6, p.49-51 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.52-4 (1981). The fine structure of the maxima of the intensities of molten commercial cast iron LK-3 (wt.%, 3.8 C, 2.67 Si, 0.64 Mn, 0.02 S, 0.1 P) was investigated as a function of the holding time (30 min, 1, 3 and 5 h) in the molten state. Diffraction patterns indicate the presence in the melt of micro-areas of cementite, graphite and austenite types. The most noticeable time-dependent changes in the structure occur during the first 15-30 min after melting, then (during 3-5 hr) the structure of the iron stabilizes to some extent. The presence of silicon in the melt causes some blurring of the diffraction effects, which are due to cementite type micro-areas, but these remain in the melt over a long period. (4 refs.)

61.30 LIQUID CRYSTALS

(see also 64.70M Transitions in liquid crystals)

- 61772 Light propagation in Williams domains as analyzed numerically by geometrical optics. K.Kondo (Dept. of Textile & Polymeric Materials, Tokyo Inst. of Technol., Tokyo, Japan), M.Arakawa, A.Fukuda, E.Kuze. *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.3, p.394-9 (March 1983). The authors have studied Williams Domain (WD) patterns in detail by observing tomograms with a polarizing optical microscope, confirming the following characteristic features: (1) there are two types of real images, upper and lower; (2) the spacings between the neighboring imaginary lines are not uniform; and (3) when the focussing plane of the objective is moved above the upper real image or under the imaginary image, the sharp image line splits into two. By taking into account the ray deflection from the wave front normal as well as the focussing effect, they have calculated numerically the characteristic distribution of phase (optical path length) as well as intensity. The results can reproduce the tomograms observed here and the photographs taken by Sato et al. (1979), holographically, showing directly the optical path length as the interference fringe patterns. (30 refs.)
- 61773 Flexoelectric constants of liquid crystals. Lin Lei (Inst. of Phys., Acad. Sinica, Beijing, China). *Commun. Theor. Phys. (China)*, vol.1, no.6, p.691-7 (1982). The elastic energy density of liquid crystal under the action of external electric field \vec{E} is given by $F = F(\vec{n}_i, n_{ij}, E_i, E_{ij}, \dots)$ where \vec{n} is the director and n_{ij} , E_{ij} the gradients. By a systematic expansion of F in polynomials and the use of material symmetries, the author obtains macroscopically for nematics and cholesterics all the possible external field effects. In addition to the well-known flexoelectric interaction $(\vec{E} \cdot \vec{n})^2$ and the flexoelectric effects of Meyer, $-e_1(\vec{E} \cdot \vec{n})(\nabla \cdot \vec{n}) - e_2(\vec{n} \cdot \nabla)\vec{n}$, the author finds a new term $e_0\vec{n} \cdot (\vec{n} \cdot \nabla)\vec{E}$ which corresponds to the flexoelectric effect related to electric quadrupoles introduced microscopically by Prost and Marcerou. This new term is not equivalent to the previous two terms of Meyer. An experiment to measure this new flexoelectric constant e_0 is proposed. Previous experiments measuring flexoelectric constants are compared and discussed in the light of the author's theory, which also applies to other cases of external vector fields. (13 refs.)
- 61774 On the possibility of microphase separation in liquid crystalline polymers. Yu.S.Lipatov, V.V.Tsukruk, V.V.Shilov (Inst. of Macromolecular Chem., Acad. of Sci., Kiev, Ukrainian SSR). *Polym. Commun. (GB)*, vol.24, no.3, p.75-7 (March 1983). The microphase structure of liquid crystalline polymers is considered in the framework of the thermodynamics of block copolymers. It is established that at a definite ratio of the flexible and rigid parts of mesogenic groups, phase separation takes place in liquid crystalline polymers. The polyesters of alkox-ybenzoic acids with 12-16 carbon atoms in the aliphatic chain end of the mesogenic groups are considered to be two-phase polymeric systems. (15 refs.)
- 61775 Variation in flatness in the successive transitions to turbulence of nematic liquid crystals. I.Matsuzaki, Y.Tsuchiya, T.Kawakubo (Dept. of Appl. Phys., Tokyo Inst. of Technol., Tokyo, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.4, p.1088-90 (April 1983). The authors have examined intermittent behavior in the successive electrohydrodynamic transitions to turbulence of nematic liquid crystals. The flatness which is a measure of the intermittency is found to enhance anomalously at the three transition points and decrease with increasing applied voltage in the turbulent region above the third enhancement point.
- 61776 Biaxial nematic phases in amphiphilic systems. A.Saupe, P.Boonbrahm, L.J.Yu (Dept. of Phys., Kent State Univ., Kent, OH, USA). *J. Chim. Phys. & Phys.-Chim. Biol. (France)*, vol.80, no.1, p.7-13 (Jan. 1983). The formation of biaxial nematic phases in mixtures of surfactants and water is discussed. Emphasis is given to experimental data that confirm the existence of a biaxial nematic phase. Some new microscopic observations and birefringence measurements are reported. Biaxial nematic phases were observed in two systems that have, in addition, two uniaxial nematic phases. The general features of the phase transitions involving these nematic phases are theoretically analyzed on the basis of a Landau expansion. Specific relations for the order parameters are derived that compare favorably with the experimental results. (21 refs.)
- 61777 Polymorphism of interfaces [Liquid crystalline phases of amphiphilic molecules]. J.Charvolin (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France). *J. Chim. Phys. & Phys.-Chim. Biol. (France)*, vol.80, no.1, p.15-23 (Jan. 1983). Liquid-crystalline phases are usually classified in two distinct groups: thermotropic and lyotropic. This terminology corresponds to the way they are obtained starting from the crystal of pure compound: by heating or by dilution with a solvent. Also it is generally considered that different molecular

species, called mesogenic or amphiphilic, are associated with each of these two classes. The author describes phases of classical amphiphilic molecules, mainly soaps, and consider in parallel smectic phases of various types formed by mesogenic molecules. Following this comparison the idea is proposed that a distinction between two classes of liquid-crystalline materials is arbitrary. It is suggested that the liquid-crystalline polymorphism in a general can be viewed in a more coherent fashion as a set of many variations about a unique theme, the division of space by an interface between two media, generated by a molecular structure, that is an assemblage of chemical group with different affinities and behaviors. (46 refs.)

- 61778 Lyotropic polymeric liquid crystals. E.T.Samulski (Dept. of Chem., Univ. of Connecticut, Storrs, CT, USA), D.B.Dupre. *J. Chim. Phys. & Phys.-Chim. Biol. (France)*, vol.80, no.1, p.25-30 (Jan. 1983). Experimental and theoretical developments in linear polymers that form liquid crystals in solution are reviewed. Emphasis is placed on results found in helical polypeptide liquid crystals. Advances in theoretical modeling of the order-disorder transition and the viscoelasticity of these phases are included together with a summary of recent experimental observations. (45 refs.)
- 61779 Polymorphism in polar mesogens. I. Physicochemistry and structure. F.Hardouin (Univ. Bordeaux, Talence, France), A.M.Levelut, M.F.Achard, G.Sigaud. *J. Chim. Phys. & Phys.-Chim. Biol. (France)*, vol.80, no.1, p.53-64 (Jan. 1983). In French. The authors present a synthesis of work about the physicochemistry of some fluid mesomorphic states; fluid means without tridimensional long range periodicities and with a liquid-like short range order. It embodies the updated thermodynamical and structural information describing the unexpected polymorphisms and phase transitions likely to occur from the various antiferroelectric arrangements of highly polar and polarizable molecules. In particular the uniqueness of the smectic A phase (or smectic C phase) is denied and two new bidimensional fluid mesophases have been discovered. (81 refs.)
- 61780 Polymorphism in polar mesogens. II. Theoretical aspects. J.Prost, P.Barois (Domaine Univ., Talence, France). *J. Chim. Phys. & Phys.-Chim. Biol. (France)*, vol.80, no.1, p.65-81 (Jan. 1983). For pt.I see *ibid.*, vol.80, p.53-64 (1983). A unique theoretical framework is shown to interpret not less than seven different smectic phases observed or expected in polar systems. A free energy with two coupled order parameters having a tendency to condense at two incommensurate wavevectors is used. The great number of smectic phases arises from the competition between these two incommensurate lengths: the impossibility to satisfy simultaneously contradictory tendencies is solved in many different ways, each of them corresponding to a distinct type of frustrated smectic. Several phase diagrams are presented. The stability and the expected electric properties of incommensurate phases are also discussed. (37 refs.)
- 61781 Polymorphism in polar mesogens. III. Molecular aspect. Nguyen Huu Tinh (Domaine Univ., Talence, France). *J. Chim. Phys. & Phys.-Chim. Biol. (France)*, vol.80, no.1, p.83-98 (Jan. 1983). In French. For pt.II see *ibid.*, vol.80, p.65-81 (1983). The rod-like molecules with a highly polar head exhibit an unexpected polymorphism often complex. The author proposes an analysis of the relationships between the molecular structure and the various phase sequences obtained so far. The influences of the polar end groups, of the length and the nature of the chain, of the sense of the dipole moments for the central groups, of the size and the hindrance of the core are taken in account with respect to the formation of the reentrant phases, of the different smectics A or smectics C and of the novel fluid bidimensional mesophases. The reentrant phenomenon, loses almost all its pathological character; on the other hand an increasing number of compounds owing very close molecular structures, seem likely to provide various phase transitions among phases with the same apparent symmetry. (55 refs.)
- 61782 Two dimensional ordering in liquid crystals: the SmF and SmI phases. J.J.Benattar (CENS, Gif-sur-Yvette, France), F.Moussa, M.Lambert. *J. Chim. Phys. & Phys.-Chim. Biol. (France)*, vol.80, no.1, p.99-110 (Jan. 1983). New smectic phases have been discovered: the SmF and SmI phases. They appear in some compounds when the length of the aliphatic chains reaches a sufficient value to minimize the interlayer coupling. They are characteristic of new stages between the three-dimensionally (3D) ordered SmB and SmG and the '2D liquid' SmC phase. These phases are made of stacked uncorrelated layers and exhibit either a topological 2D order in SmI or a short range order within a layer in SmF (hexatic phase). These main features are established from different experimental techniques: X-rays, neutrons, NMR and DTA. (37 refs.)
- 61783 Plastic behavior and polymorphism of smectic liquid crystal. G.Durand (Lab. de Phys. des Solides, Univ. de Paris-Sud, Orsay, France). *J. Chim. Phys. & Phys.-Chim. Biol. (France)*, vol.80, no.1, p.119-25 (Jan. 1983). Smectic systems are characterized by a lamellar ordering of more or less liquid layers. Mechanically, one expects the layers to present an elastic reaction to normal compression and a viscous reaction to a parallel shear. Rheological experiments are described in various smectic phases, which give the stress/strain relationship for small amplitude oscillations, in various geometries. Non-linear effects associated with texture instabilities are mechanically visible in the high frequency elastic regime. In smectic A, for layer compression at low frequency, a plastic relaxation probably due to the easy climb of edge dislocation, prevents the observation of the intrinsic viscoelastic relaxation associated with permeation. In smectic B, for shear parallel to the layers, above a low frequency Newtonian fluid-like behavior, one observes an elastic regime with a very low $C_{44} \sim 10^6$ cgs. This explains why the B phase appears practically as a lamellar phase, while presenting for X-rays a 3D positional ordering. (38 refs.)
- 61784 Twisted chiral mesophases. J.Billard (Lab. de Phys. de la Matière Condensée, Coll. de France, Paris, France). *J. Chim. Phys. & Phys.-Chim. Biol. (France)*, vol.80, no.1, p.127-35 (Jan. 1983). In French. The conditions for obtaining chiral mesophases with elongated molecules are studied. With the exception of the blue phases, all known chiral mesophases of these compounds are examined. Only one non-layered is twisted. The twist possibilities of the layered thermotropic mesophases are studied. Experimental data exists for five tilted smectics. The situation for four other tilted and for two normal smectics is examined. Peculiarities of the phase diagrams of two enantiomers are studied. Some physical properties of the twisted mesophases are reviewed: linear optical; surface, electric and magnetic fields alignments; textures; ferroelectricity; pyroelectricity and nonlinear optics. The methods to determine the twist sense are listed. Examples of the six known twisted mesophases are given. The most studied, the cholesteric, is emphasized. The most

useful applications of the liquid crystals, based on the particular properties of the twisted mesophases, are listed. (152 refs.)

61785 Disc-like molecules and mesogenic polymorphism. C.Destrade, H.Gasparoux, P.Foucher, Nguyen Huu Tinh (Domaine Univ., Talence, France), J.Malthete, J.Jacques.

J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.1, p.137-48 (Jan. 1983). In French.

Among the various mesogenic polyaromatic cores, only benzene, triphenylene, truxene and anthraquinone hexasubstituted derivatives exhibit one or several D columnar phase and/or a N_D lenticular nematic phase. A simple answer is given for the nomenclature problem concerning the six different columnar phases: two structural parameters are sufficient for the differentiation of these phases: symmetry of the lattice, ordering or disordering in the columns. Several examples of disk-like compounds presenting these phases are described, with a discussion of the specificity of the corresponding optical textures. Then the complex polymorphism of these new mesogenic materials ('normal', 'inverse', reentrant columnar-nematic sequences) is reviewed. A simple classification of various lyotropic and thermotropic phases, based on the shape of structural element (finite or indefinite cylinder, disk, indefinite sheet, globule) is proposed. (90 refs.)

61786 Structures of mesophases formed by disc-like molecules. A.M.Lévil (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).

J. Chem. Phys. & Phys.-Chim. Biol. (France), vol.80, no.1, p.149-61 (Jan. 1983). In French.

With disc-like molecules it is possible to obtain two classes of mesophases: In columnar (or canonic) mesophases, the molecules are stacked in parallel columns, these columns forming a periodic two-dimensional array. The nematic phase of disc-like molecules is similar to the ordinary nematic phase of rod-like molecules. Nevertheless a local order of columns still remains present in fluid mesophase. The author gives the limits for the disc-like phases assuming that a disc-like molecule must be (in the mesophase) made of a planar rigid core surrounded by a more or less planar ring of aliphatic chains. (40 refs.)

61787 Modulated crystal B phases and B-to-G phase transitions in two types of liquid crystalline compound. P.A.C.Gane, A.J.Leadbetter (Chem. Dept., Exeter Univ., Exeter, England).

J. Phys. C (GB), vol.16, no.11, p.2059-67 (20 April 1983).

X-ray diffraction measurements have been made of the wavevector and intensity of satellite diffraction spots as a function of temperature in two examples of crystal B phases. In N-(5-n butyloxybenzylidene)-4-n-heptylaniline (SO.7) a simple sinusoidal layer modulation of fixed wavelength grows in amplitude with decreasing temperature until the B-phase becomes unstable at the first-order B-to-G phase transition. In 4-n-pentyloxybenzenethio 4'-n-dodecyloxybenzoate (12S5) the layer modulation approximates to a ramp function which grows in wavelength at constant ramp angle with decreasing temperature until the G phase, having a very similar tilt angle is formed at a first-order transition. (9 refs.)

61788 Orientational effect of a surface light wave on liquid crystals. B.Ya.Zel'dovich, N.V.Tabiryann (Inst. of Problems in Mech., Acad. of Sci., Moscow, USSR).

JETP Lett. (USA), vol.36, no.5, p.179-82 (5 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.5, p.144-7 (5 Sept. 1982). [received: April 1983]

It is predicted that the nonpropagating light wave appearing with total internal reflection and localized near the interface has a strong effect on a nematic or cholesteric liquid crystal mesophase. The change in the Grandjean structure of the cholesteric liquid crystal is manifested as a change in pitch. On the other hand, the planar structure of the nematic liquid crystal becomes a critical structure under the action of the wave. (9 refs.)

61789 Bond orientational order in liquids and amorphous solids. D.R.Nelson (Dept. of Phys., Harvard Univ., Cambridge, MA, USA).

Physica A (Netherlands), vol.118A, no.1-3, p.315-16 (March 1983).

(Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

Summary form only given, as follows. Recent theoretical work on the Kosterlitz-Thouless model of a dislocation-mediated melting in two dimensions suggests the existence of a new 'hexatic' phase of matter, intermediate between a solid and a liquid. Hexatic liquids display persistent correlations in the 'bonds' joining near neighbor atoms. Although computer simulations have produced conflicting evidence for an equilibrium hexatic phase, the discovery of a 'staked hexatic' phase in bulk smectic liquid crystals has been reported recently. It is interesting to consider bond orientational order in other contexts. Translational and orientational order can be studied, for example, in randomly packed planar array of hard spheres with two different sizes. For an appropriate size ratio, and a dilute concentration of large spheres, one finds a phase without translational order, but with very long range correlations in the orientations of local hexagonal axes. Bond orientational order can assume a variety of forms in bulk materials. Crystals disordered by an equilibrium concentration of unbound dislocation loops display bond orientational order with a cubic symmetry. Another possibility is orientational order with an 'icosahedral' symmetry. It is well known that an icosahedral clustering of twelve atoms about a central sphere is energetically preferable to crystalline packings for most simple pair potentials. (9 refs.)

61790 Microscopic derivation of nonlinear hydrodynamics in ordered systems with applications to nematic liquid crystals. Avraham Ben-Mizrachi, I.Procaccia (Chem. Phys. Dept., Weizmann Inst. of Sci., Rehovot, Israel).

Phys. Rev. A (USA), vol.27, no.4, p.2126-39 (April 1983).

A microscopic theory suitable for the derivation of nonlinear hydrodynamic equations in systems with a broken symmetry is presented. The theory is based on a recently introduced projection operator technique which yields results correct to any order in the deviation from equilibrium and rests on a gradient expansion around 'local-equilibrium' ensembles. The usefulness of the method is demonstrated by deriving nonlinear nematodynamics. The reversible as well as the dissipative nonlinearities are obtained in what seems to be a transparent fashion. Comparison with phenomenological derivations is presented. (20 refs.)

61791 Preliminary observations of defects in a polymeric nematic phase. M.Kleman, L.Liebert, L.Strzelecki (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).

Polymer (GB), vol.24, no.3, p.295-9 (March 1983).

Some optical observations of defects (disclination lines) in a polyester nematic phase are presented. These observations clearly show the predominance of lines of half integer strength. This result, as well as other observations, seem to fit in with large values of the splay and bend constants K_1 and K_2 compared with the twist constant K_3 . However, K_1 seems to be much larger than K_3 . Interesting phenomena related to disclination core structure and to the surface lines, involving a particular molecular distribution in the surface, are described. (10 refs.)

61792 Use of molecular dynamics to investigate liquid-crystal systems consisting of disk-shaped molecules, and prediction of new mesophases in such systems. A.L.Tsykalo, A.D.Bagmet (Technol. Inst. of Refrigeration Industry, Odessa, USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.565-9 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.941-7 (Sept.-Oct. 1982). [received: April 1983]

The authors give a molecular-dynamic model of a liquid-crystal system of disk-shaped molecules. They determine the most important characteristics of the structure (orientational and translational distribution functions and order parameters). On the basis of these results they discuss the possibility of new liquid-crystal mesophases in such systems. (14 refs.)

61793 Physical properties of liquid crystals of 4-(4-alkylbicyclo[2,2,2]octyl)benzonitriles. P.Adomenas, D.Girdzhynaitis, V.A.Grozhiok, V.Sheskauskas (State Univ., Vilnius, Lithuanian SSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.607-8 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1012-13 (Sept.-Oct. 1982). [received: April 1983]

With the aim of assessing possible practical uses, the authors have synthesized several homologous 4-(4-alkylbicyclo[2,2,2]octyl)benzonitriles (1). They have studied the dielectric and optical properties and the kinematic viscosity of the compounds, including measurements of the dielectric constants and refractive indices. (8 refs.)

61794 Investigation of nematic liquid crystals by correlation spectroscopy. Determination of ratios of viscosity and elasticity constants. S.A.Ivanov, V.Yu.Vetrov (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.609-10 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1014-16 (Sept.-Oct. 1982). [received: April 1983]

Describes a light scattering method of determining the viscoelastic ratios of NLC, and gives the experimental geometries and results of determinations of these ratios in 4-methoxybenzylidene-4'-butylaniline (MBBA) and in a liquid-crystal mixture of p-butyl-p'-methoxyazoxybenzene (BMAOB) and p-butyl-p'-heptanoyloxyazoxybenzene (BHAOB) with marker ZhK-440. (5 refs.)

61795 An optical method of determining the elastic constant ratio K_{33}/K_{11} in nematic liquid crystals. S.A.Ivanov, V.Yu.Vetrov (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.611-12 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1017-18 (Sept.-Oct. 1982). [received: April 1983]

A proposed optical method of determining the elastic constant ratio K_{33}/K_{11} is based on the fact that for each oriented nematic there are two experimental geometries in which quasielastic scattering of light occurs in the B and S fluctuation modes, and that these geometries differ only in the position of the specimen. Experiments were performed with nematic liquid crystals of MBBA and ZhK-440 at temperature $t = 20^\circ\text{C}$. Planar orientation of the specimen was obtained by rubbing SnO₂-coated glass. The specimen thicknesses were 30 or 55 μ . The light source was a helium-neon laser, and the radiation receiver was an FEU-79 photomultiplier, from which the photocurrent was registered by a V2-22 digital voltmeter. The refractive indices n_o and n_e were taken from the literature: for MBBA, $n_o = 1.54$, $n_e = 1.75$; for ZhK-440, $n_o = 1.540$, $n_e = 1.784$. Starting from these values the authors calculated the laboratory scattering angles $\theta = 47^\circ$ for MBBA and $\theta = 51^\circ$ for ZhK-440. In calculating the elasticity constant ratio K_{33}/K_{11} , corrections were applied for the change in solid angle with scattering geometry, and also for one associated with the propagation of light in an anisotropic medium. (5 refs.)

61796 A new method for determining the elastic constant ratio K_{33}/K_{11} in nematic liquid crystals. G.A.Beresnev, V.G.Chigrinov, M.F.Grebenkin (Sci.-Res. Inst. of Organic Intermediate Products & Dyes, USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.612-14 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1019-21 (Sept.-Oct. 1982). [received: April 1983]

The distinguishing feature of the authors' method is the use of a cell with so-called homeopolar orientation of the NLC (an ordinary cell of the sandwich type with transparent electrodes with the orientation of the NLC on one electrode planar, and on the other, homeotropic). The cell is placed between crossed polaroids and illuminated with light from a helium-neon laser (normally incident), and the transmission of the system is registered by a photoreceiver. If the dielectric anisotropy of the NLC is positive, then one applies to the cell a voltage sufficient to reorientate the NLC into a homeotropic structure, and, counting the number of maxima and minima of the transmission of the cell, one determines the phase lag. One does not need to know the exact dependence of the phase lag on the voltage. Using the experimental value of Δn_{hp} , K_{33}/K_{11} can be determined from computer calculations of the theoretical relationships between Δn_{hp} and K_{33}/K_{11} , in which the only other parameter is n_o/n_e . (5 refs.)

61797 Dominant role of 'weak' dispersion interactions in the formation of nematic order. V.K.Pershin, S.A.Skopinov (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1165-6 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1894-6 (Sept. 1982). [received: April 1983]

It is shown that the concept of a cluster structure in NLC brings into quantitative agreement the theoretical and experimental results and explains qualitatively many of the observed phenomena. (8 refs.)

61798 Study of orientational properties of thermotropic liquid-crystalline polymer with side mesogenic groups by IR-spectroscopy method. V.L.Khodzaeva, M.V.Shishkina, V.S.Grebneva, I.I.Konstantinov.

Vysokomol. Soedin. Ser. A (USSR), vol.25, no.3, p.612-16 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

Orientational properties of thermotropic liquid-crystalline polymer with side mesogenic groups poly-p-n-butylloxyphenyl-p-metacryloyloxy-(11-undecanoyloxy)benzoate and of corresponding monomer have been comparatively studied by the IR-spectroscopy method. Both polymer and monomer were shown to form the homeotropically or homogeneously oriented liquid-crystalline films. The side mesogenic groups in these films are mutually ordered and oriented in the surface of a support normal to it, while the polymethylene spacer binding mesogenic groups with the main chain exists in the nonordered state. The degree of orientation of side mesogenic groups of a polymer corresponds of the degree of orientation of monomer molecules. Homogeneous orientation during cooling below the softening temperature is maintained which permits one to obtain oriented films of the glassy polymer. (3 refs.)

61799 Critical voltage effect in Ni₂Fe and FeCo ordering alloys. H.Matsuhata (Dept. of Materials Sci. & Technol., Kyushu Univ., Fukuoka, Japan), K.Kuroda, Y.Tomokiyu, T.Eguchi. *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.3, p.404-7 (March 1983). The critical voltages in ordered and disordered states of Ni₂Fe and FeCo alloys were measured for the systematic reflections without superlattice reflections. A small increase in the critical voltage was observed on ordering for the 111 systematic reflections of Li₁ type Ni₂Fe. The temperature factors and the Debye temperatures were evaluated from the measured critical voltages. The changes on ordering in the temperature factors and Debye temperatures were in reasonably good agreement with those derived by X-ray investigation and elastic constants. It is shown that the change in the critical voltage of Ni₂Fe is mainly due to the change in the thermal mean-square displacement of atoms. No obvious change in the critical voltage on ordering was detected for 110 systematic reflections of B₂ type FeCo. (19 refs.)

61800 About short-range order of amorphous i-B/N films investigated by energy loss spectroscopy. S.Klose, K.Breuer, B.Winde. *Exp. Tech. Phys. (Germany)*, vol.31, no.1, p.101-5 (1983). In German. Energy-loss-spectroscopy (ELS) is used for the investigation of ion-plated thin boron/nitrogen films. As stated in previous work, these films—when deposited adherently on various substrate materials—are hard and essentially amorphous. ELS yields information about short-range order. There is a remarkable part of material having a short-range order which corresponds to that of cubic boron nitride. (7 refs.)

61801 Transient gratings on a-GaAs under laser annealing conditions. W.Marine, J.Marfaing, F.Salvan (Dept. de Phys., Faculté des Sci. de Luminy, Marseille, France). *J. Phys. Lett. (France)*, vol.44, no.7, p.L271-8 (1 April 1983). Transient gratings are used to study the dynamical processes involved in a-GaAs crystallization on the nanosecond scale. When the irradiation power density is varied, two regimes are observed: $-3.5 \text{ MW/cm}^2 < W < 7.5 \text{ MW/cm}^2$: crystallization occurs without melting; $-7.5 \text{ MW/cm}^2 < W < 15 \text{ MW/cm}^2$: one observes a melted zone before crystallization. Free carrier diffusion is a very efficient mechanism in these laser annealing conditions. (31 refs.)

61802 Dual properties of conjugate disclination segment networks in amorphous materials. M.Kleman (Lab. de Phys. des Solides, Orsay, France). *J. Phys. Lett. (France)*, vol.44, no.8, p.L295-302 (15 April 1983). The author extends some recent results concerning the structural properties of amorphous materials deduced from a model in which the frustration effects leading to noncrystallographic short range order are described by curved spaces. It is proposed that the final structure obtained from the 'best' mapping from curved space consists in two conjugate irregular networks of straight segments, which are sources of distortions of opposite signs and of the elastic disclination type. Also, each network carries either spherical or hyperbolic curvature, in the sense that they correspond to different coordination numbers for the atoms. The typical size ξ of the network unit is estimated from a balance of (internal) elastic stresses and of core energies, at low temperature; at higher temperatures (above a typical T_0 temperature definitely smaller than T_m) the networks are mobile and their entropy must be taken into account, which leads to a dependence of ξ with temperature. Analogy and differences with a usual Vogel-Fulcher law are outlined, and the existence of some sort of long-range orientational order stressed. (14 refs.)

61803 Amorphization of crystalline diluted Ising ferromagnet. R.Honmura (Dept. de Física, Univ. Federal de Alagoas, Maceio, Brazil), I.P.Fittipaldi, E.F.Sarmiento, T.Kaneyoshi. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1485-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The amorphization of a crystalline diluted Ising system is studied by using an effective-field theory. The exchange parameters are assumed to be distributed according to delta and Gaussian distributions. The authors have found that both the phase diagrams and the thermal behavior of the magnetization are strongly sensitive on the distribution assumed to the fluctuating exchange parameter. (4 refs.)

61804 Defect states in amorphous silicon. N.Ishii, M.Kumeda, T.Shimizu (Dept. of Electrical Engng. & Electronic Engng., Fukui Inst. of Technol., Fukui, Japan). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.91-100 (1 March 1983). The nature of defects in amorphous silicon is calculated by using several methods for clusters with varying size. The wave function of the dangling bond state has an approximately exponential decay with a decay length of about 0.2 nm. The correlation energy of electrons and the hyperfine structure constant with ²⁹Si for the dangling bond state are evaluated. The correlation energy and the *g*-values are calculated both for a weak bond and for a two-fold coordinated defect and are compared with experiments. (20 refs.)

61805 Effects of ionizing radiation on amorphous insulators. D.L.Griscom, E.J.Friebele (Naval Res. Lab., Washington, DC, USA).

Radiat. Eff. (GB), vol.65, no.1-4, p.63-72 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Reviews the effects of ionizing radiation on amorphous insulators. The electronic and atomic structures of radiation-induced defect centers (trapped electrons or holes) are discussed primarily in terms of data deriving from the technique of electron spin resonance. Emphasis is placed on important fiber-optic materials (pure and doped fused silicas) and attention is directed to the problem of relating radiation-induced optical absorption bands to specific defect structures. 61806 X-ray diffraction methods to determine crystallinity and preferred orientation of lithium disilicate in Li-Zn-silicate glass-ceramic fibres. A.Benedetti, G.Cocco, G.Fagherazzi (Istituto di Chimica Fisica, Univ. Ca' Foscari, Venezia, Italy), B.Locardi, S.Meriani. *J. Mater. Sci. (GB)*, vol.18, no.4, p.1039-48 (April 1983).

Three X-ray diffraction methods for the evaluation of the microstructural features shown by glass-ceramic fibres obtained by various heat treatments have been developed and discussed. Fibres made of a Li-Zn-silicate glass of the following chemical composition were investigated (mol.%): SiO₂ 66.75, Li₂O 23.45, ZnO 8.00, K₂O 1.00, P₂O₅ 0.80. The first method is devoted to measure the preferred crystal orientation of lithium disilicate crystals which begin to grow starting from 580°C with the *c*-axis lying preferentially normal to the fibre external surface. This method has employed a four-circle diffractometer by means of which the intensity distribution of the equatorial 002 X-ray reflection could be evaluated. The other two methods regard the crystallinity content determination of lithium disilicate formed at 590°C as well as 620°C either after a nucleation step at 480°C or at 500°C, or without any nucleation treatment. The results obtained with both methods have been compared together and have been found in good agreement. (22 refs.)

61807 Mechanisms of nucleation and crystallization of lithium disilicate in Li-Zn-silicate glass-ceramic fibres. A.Benedetti, G.Cocco, G.Fagherazzi (Istituto di Chimica Fisica, Univ. Ca' Foscari, Venezia, Italy), S.Meriani, G.Scarinci. *J. Mater. Sci. (GB)*, vol.18, no.4, p.1049-58 (April 1983).

The preferred crystal orientation of Li₂Si₂O₇ crystallites has been evaluated in several partially crystallized glass fibres with the following chemical composition in mol.%: 66.75 SiO₂; 23.45 Li₂O; 8.00 ZnO; 1.00 K₂O and 0.80 P₂O₅. The crystallites were shown to be grown radially with the *c*-axis directed from the surface towards the core of the fibre. When glass fibres have been subjected to a nucleation treatment step, this preferred orientation slightly increases in the temperature range 590 to 620°C, by increasing the crystallinity content. A kinetic study on the crystalline volume coarsening, carried out according to the Johnson-Mehl-Avrami equations, showed a mechanism of linear growth for the lithium disilicate phase with the (001) growing planes moved inward from the surface to the core of the fibre. The small-angle X-ray scattering results were obtained by using a masking liquid with an electron density close to that of the glass fibres investigated, in order to eliminate the total external reflection and surface scattering. Results indicated that two distinct particle fractions are precipitated inside the fibres after glass-in-glass phase separation and nucleation at 500°C for various periods of time. The fraction of the largest particles, 13 to 20 nm in size, is probably constituted with vitreous SiO₂-rich droplets, whereas the smallest particles, 2.5 to 6.5 nm in size, are probably Li₂O-rich clusters containing P₂O₅. (38 refs.)

61808 Crystallization of amorphous Cu₆₀Zr₄₀ prepared by magnetron sputter deposition. R.G.Walmsley, A.F.Marshall, D.Bouchet, D.A.Stevenson (Center for Materials Res., Stanford Univ., Stanford, CA, USA). *J. Non-Cryst. Solids (Netherlands)*, vol.54, no.3, p.277-300 (March 1983).

The crystallization of amorphous Cu₆₀Zr₄₀ prepared by magnetron sputter deposition was studied by differential scanning calorimetry, X-ray diffraction and transmission electron microscopy. Calorimetric results were similar to those reported in the literature for liquid-quenched Cu₆₀Zr₄₀, including the manifestation of a glass transition. Crystallization above and below the glass transition temperature, *T*_g, occurred by nucleation and growth of the equilibrium phase, Cu₁₀Zr₇. This phase was characterized by convergent beam electron diffraction. With isothermal annealing below *T*_g, the time scale for crystallization indicated that the vapor-quenched alloy was kinetically more stable than the liquid-quenched alloy. This was interpreted as a difference in the quenched-in structures, produced by the different synthesis methods. During longer anneals, TEM analysis indicated that the structure was being contaminated by oxygen. (29 refs.)

61809 A study of primary crystallization in Fe₄₀Ni₃₀Mo₄B₁₈ glassy alloy by small angle X-ray scattering. G.Cocco, L.Schiffini (Istituto di Chimica Fisica Univ., Venezia, Venezia, Italy), L.Battezzati, A.Lucci. *J. Non-Cryst. Solids (Netherlands)*, vol.54, no.3, p.301-11 (March 1983).

The primary crystallization of the Fe₄₀Ni₃₀Mo₄B₁₈ glassy alloy was followed with a Kratky SAXS camera. By using SAXS conventional treatments of the experimental data, an interconnected structure was found distinctive of the

underlying texture in the early stage of the phase decomposition. At higher temperature treatments and well inside the DSC peak relevant to the solid solution appearance, the structural inhomogeneities reach a more defined morphology with a clear interphase boundary. Nevertheless, during this nucleation stage no distinctive crystalline states were detectable in the wide angle patterns. The particle size evolution points out that a coarsening mechanism starts with the achievement of the steady value of the SAXS integrated intensity and concurrently with the long range order establishment. (28 refs.)

61810 Characterization studies of $\text{AgI-Ag}_2\text{O-MoO}_3$ glasses. S.Hemlata, P.R.Sarode, K.J.Rao (Solid State & Structural Chem. Unit, Indian Inst. of Sci., Bangalore, India).

J. Non-Cryst. Solids (Netherlands), vol.54, no.3, p.313-21 (March 1983). Glass formation has been investigated in the system $\text{AgI-Ag}_2\text{O-MoO}_3$. X-ray absorption edge chemical shifts, infrared spectra and heat capacities of the various glass compositions have been measured. The probable anion structures in the oxygen excess and deficient regions have been discussed. (11 refs.)

61811 Structural relaxation in (Fe-Cr)-based glass. T.Katayama (Electrotech. Lab., Ibaraki, Japan), Y.Nishihara, M.Miyazaki, S.Ogawa.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1561-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The Mossbauer effect of ^{57}Fe and Curie temperature in amorphous $\text{Fe}_{65}\text{Cr}_{20}\text{B}_{15}\text{Si}_2$ and $\text{Fe}_{64}\text{Ni}_{16}\text{B}_{14}\text{Si}_8$ were measured to investigate the microscopic mechanism of structural relaxation. Broadening of the Mossbauer spectra appears around 100 and 250°C of the annealing temperature in these alloys. Corresponding to the broadenings, T_c also changes after the annealing. (7 refs.)

61812 Structural relaxation and magnetism in amorphous alloys. T.Egami (Dept. of Materials Sci. & Engng., Univ. of Pennsylvania, Philadelphia, PA, USA).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1571-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Structural relaxation phenomena in amorphous alloys caused by post-quenching heat treatments are discussed in relation to the magnetic properties. It is pointed out that both microscopically irreversible and reversible relaxation processes exist, and are related to the changes in the atomic level density fluctuation and shear fluctuation, respectively. The importance of the microscopic variables in determining the kinetics of the reversible relaxation process is emphasized. (30 refs.)

61813 Cristobalite-type cage structure models for alkali silicate glasses. A.Osaka, K.Takahashi (Dept. of Industrial Chem., Okayama Univ., Okayama, Japan).

Yogyo-Kyokai-Shi (Japan), vol.90, no.1048, p.703-9 (1982). Additivity for the molar volumes of alkali silicate glasses ($0 < R_2\text{O} < 33.3$ mol.%) was discussed in terms of two structural units, $\text{SiO}_{4/2}$ and $\text{ROSiO}_{3/2}$. The units were represented by the cristobalite-type cage skeletons composed of Si-O-Si and Si-OR-RO-Si bonds. The cages involved voids associated with the units and the glasses were regarded as the aggregates of those cage skeletons. The deviation from the linearity (additivity) of molar volumes against $R_2\text{O}$ molar fraction was excellently approximated by the random packing of two kinds of spheres which corresponded to the $\text{SiO}_{4/2}$ and $\text{ROSiO}_{3/2}$ units. Furthermore, based on the cage structure model, Si-Si distances at the bridging and non-bridging parts were evaluated. (14 refs.)

61.40K Polymers, elastomers, and plastics

61814 Effect of molecular extension of a melt on the crystallinity of polyethylene, subjected to repeated crystallization. A.N.Melkumov, V.P.Prutkin, A.S.Bank, R.B.Gafurov, I.L.Gabaev.

Vysokomol. Soedin. Ser. B (USSR), vol.25, no.1, p.22 (1983). In Russian. The influence of prior molecular extension on the degree of crystallinity of recrystallized polyethylene was experimentally studied by applying different amounts of elongation to high-pressure polyethylene emerging from an extrusion die at 170°C, cooling the material to room temperature, remelting and re-extruding to thin films. Infra-red spectroscopic analysis of the films showed that, with increase in the amount of extension during the initial crystallization, the degree of crystallinity of the re-extruded polyethylene also increased, and was accompanied by a decrease in the proportion of gauche-isomers and an increase in that of trans-isomers. These results indicated that the structural elements produced under conditions of molecular extension did not disappear during subsequent melting and, during the second crystallization, served as centres for the growth of lamellae. (2 refs.) A.J.B.

61815 Structure of poly-n-phenylene-1,3,4-oxadiazole. N.I.Popik, M.V.Shabygin, L.V.Vilkov, A.S.Semenova, T.V.Kravchenko.

Vysokomol. Soedin. Ser. B (USSR), vol.25, no.1, p.38-40 (1983). In Russian. Experiments are described, aimed at elucidating the structural features of poly-n-phenylene-1,3,4-oxadiazole (POD) and based on the use of a model compound 2,5-diphenyl-1,3,4-oxadiazole (DOD). The structure of DOD was

investigated by the method of electron diffraction in the gaseous phase. The results of X-ray crystallographic analysis of crystalline DOD tended to confirm the validity of the suggested model of the structure of DOD. (17 refs.) A.J.B.

61816 Poly(ethylene sulfide): reevaluation of the electron diffraction structure analysis. B.Moss, D.L.Dorset (Electron Diffraction Dept., Medical Found. of Buffalo Inc., Buffalo, NY, USA).

J. Macromol. Sci. - Phys. (USA), vol.B22, no.1, p.69-77 (1983). The single-crystal electron diffraction data of poly(ethylene sulfide) reported by Hasegawa, Claffey, and Geil (see *ibid.*, vol.13, p.89, 1977) have been reinvestigated. Taking into account possible crystal bending effects and dynamical scattering leads to an improved structural model. The final agreement factor of $R=0.21$ is considerably better than that determined in the original analysis, $R=0.33$, attesting to the quality of the zonal electron diffraction data obtained by these investigators. (13 refs.)

61817 Radiation-induced crystallinity changes in pressure-crystallized ultrahigh molecular weight polyethylene. S.K.Bhateja (Dow Chem. Co., Midland, MI, USA).

J. Macromol. Sci. - Phys. (USA), vol.B22, no.1, p.159-68 (1983). Exposure to high-energy radiation has been known to induce structural changes in linear polyethylene (LPE). In the present work, it was decided to investigate the possibility of further enhancing, by irradiation and subsequent aging, the degree of crystallinity and melting temperature of pressure-crystallized ultrahigh molecular weight (UHMW) PE. (43 refs.)

61818 Observations of spherulitic structure by etched monolithic polypropylene samples by means of a scanning electron microscope. A.M.Atanasov, T.St.Gancheva (WMEI 'Lenin', katedra 'Chimia', Sofia, Bulgaria).

Polim. Tvorzywa Wielkocząsteczkowe (Poland), vol.27, no.8, p.303-5 (Aug. 1982). In Polish. [received: March 1983] The TEMSCANIEM 100C apparatus has been applied in the observation of spherulitic structure of bulk polypropylene samples (PD 161 grade of Hercules) etched with chromic mixture. The optimum composition of the etching solutions has been established and a high quality of patterns has been stated in recompense for the long duration of the process. (8 refs.)

61819 Structural order in alkali-degraded PAN as seen in studies of low-temperature thermal conductivity. N.S.Batty, A.J.Gradwell, J.T.Guthrie (Dept. of Color Chem. & Dyeing, Univ. of Leeds, Leeds, England), D.Greig, N.D.Hardy, R.Jakeways, M.Sahota.

Polymer (GB), vol.24, no.3, p.258-62 (March 1983). The thermal conductivity, κ , of polyacrylonitrile (PAN), subjected to varying degrees of degradation, has been measured in the temperature range 2-100K as a means of studying the structural order of the samples. Although, at higher temperatures, the variation in κ throughout the range of specimens is only ~30%, at 2K there is an order of magnitude increase in conductivity between the undegraded and most highly degraded samples. Such a change is indicative of a pronounced decrease in crystallinity, and this interpretation is supported by estimates of crystallinity as seen through X-ray analysis. (13 refs.)

61820 X-ray diffraction studies of some halatopolymers. T.A.Ibidapo, D.J.Johnson (Dept. of Textile Industries, Univ. of Leeds, Leeds, England).

Polymer (GB), vol.24, no.3, p.271-4 (March 1983). The crystal structure and degree of crystallinity of a number of melt-spinnable halatopolymers has been investigated. These materials can be characterized by a well defined 'ionic' peak at low diffraction angle. In general they have a tetragonal unit cell, although the more perfectly crystalline materials may well belong to a triclinic crystal system. Changes in crystallinity were investigated in terms of method and conditions of preparation, and of thermal treatment. Stannous dicarboxylates had the most widely variable crystallinity. (9 refs.)

61821 Small angle neutron scattering study of the structure of a triblock copolymer of styrene and isoprene during extension. R.W.Richards (Dept. of Pure & Appl. Chem., Univ. of Strathclyde, Glasgow, Scotland).

Polymer (GB), vol.24, no.3, p.275-8 (March 1983). A triblock copolymer with a styrene weight fraction of 0.41, has been examined at various extension ratios using small angle neutron scattering. The original 'polycrystalline' material with a face centred cubic arrangement of styrene domains acquires orientation as the extension ratio increases. Affine deformation is not obeyed at the supramolecular level and there is some evidence for nonuniform stress at this level. (16 refs.)

61822 The determination of molecular orientation in uniaxially compressed PMMA by X-ray scattering. G.R.Mitchell, A.H.Windle (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England).

Polymer (GB), vol.24, no.3, p.285-90 (March 1983). A procedure is presented for obtaining full molecular orientation information from wide angle X-ray scattering patterns of deformed noncrystalline polymers. The method is based on the analysis of experimental and calculated scattering patterns into their spherical harmonics. The results obtained for PMMA are compared with values predicted by the pseudo affine and affine deformation schemes. (23 refs.)

61823 Crystal structure analysis of polyethylene with electron diffraction intensity data: deconvolution of multiple scattering effects. D.L.Dorset, B.Moss (Electron Diffraction Dept., Medical Foundation of Buffalo Inc., Buffalo, NY, USA).

Polymer (GB), vol.24, no.3, p.291-4 (March 1983). Recent determinations of n-paraffin and polyethylene crystal structures from electron diffraction data have claimed chain setting angles different from those reported for n-hexatriacontane. Re-evaluation of these data show that these determinations must be questioned because the intensities used were badly marred by multiple scattering. Due to the complexity of this phenomenon, efforts to deconvolute this error source are only partially successful. An independent structure determination for mostly unilamellar crystals of very low molecular weight polyethylene with data less affected by multiple scattering indicates that the atomic coordinates originally proposed for polyethylene in the earliest X-ray structure can still be justified. (27 refs.)

61824 Theoretical prediction of domain sizes in IPNs and related materials. J.K.Yeo, L.H.Sperling, D.A.Thomas (Materials Res. Center, Lehigh Univ., Bethlehem, PA, USA).

Polymer (GB), vol.24, no.3, p.307-13 (March 1983). A series of new theoretical equations for predicting the domain size in interpenetrating polymer networks, IPNs, and related materials was derived. The equations are based on a domain formation process comprising the crosslinking density of each polymer, mixing and demixing thermodynamics, network swelling and elastic deformation of each polymer network, and the interfacial tension between two polymers. The new equations are applicable to both crosslinked and linear materials. The experimental variables required to determine the domain size include the volume fraction and crosslink level of each polymer (or molecular weight, if linear), the interfacial tension, and the temperature. The theory was applied to poly(n-butyl acrylate)/polystyrene IPNs

and semi-IPNs. The results are also compared with the earlier theory of Donatielli et al. (1977). (32 refs.)

61825 Two-dimensional random coil chains on hexagonal lattices. V.Mom (Gorlaeus Labs, State Univ., Leiden, Netherlands). *Polymer (GB)*, vol.24, no.4, p.409-16 (April 1983). A method of formulating random coil chains that can be used as models of amorphous polymers is described. The method is based on an algorithm that finds self avoiding random chains on finite lattices. The lattice constant is chosen to be wide enough to avoid the substituents of the polymer interfering with one another. As an example, the construction of the two dimensional random coil packing structure of polyethylene is discussed. (4 refs.)

61826 Some electron microscopic observations of sulphonated EPDM polymers. P.K.Agarwal, E.B.Prestridge (Corporate Res.-Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA). *Polymer (GB)*, vol.24, no.4, p.487-90 (April 1983).

The electron microscopy observations have been conducted with films cast from dilute solution based on sulpho EPDMs derived from various cations. Some very interesting morphological features are observed. Aggregated regions of sizes in the range of 500 to 1000nm are found in the metal sulphonated polymers, while the absence of structure is observed in the base polymer and its acid derivative. This type of morphology has not been previously reported, and these aggregates appear about 100 times larger than typically expected for phase separated ionomers. Possible explanations of these morphologies are discussed. (23 refs.)

61827 Effect of poly(propylene oxide) segment size on structure-property relationships in elastomeric ionene. M.Watanabe, Y.Takizawa, I.Shinohara (Dept. of Polymer Chem., Waseda Univ., Tokyo, Japan). *Polymer (GB)*, vol.24, no.4, p.491-7 (April 1983).

The dynamic mechanical, thermal scanning, stress-strain and water sorption behaviours of the elastomeric ionene consisting of ionene and poly(propylene oxide) (PPO) segments are studied. The effect of PPO segment size on the microphase-separated structure in this material is described by the change of dynamic mechanical and thermal relaxation temperatures. The mixing of the PPO segment into the ionene segment domain increases with decrease of PPO segment size and reduces the crosslinking effect of the ionene segment domain, which leads to an increase in hysteresis of loading in this material. The number of equilibrium sorbed water molecules per ionene segment increases with increase in the purity of the ionene segment domain. (24 refs.)

61828 Investigation by the molecular-probe method of the changes in the packing density of filled epoxide compositions during hardening. G.Ya.Menzeres, A.N.Dyakova, M.S.Kligshstein, E.G.Moisya, F.G.Fabulyak (Inst. of Chem. of High-Molecular-Weight Compounds, Acad. of Sci., Kiev, Ukrainian SSR).

Theor. & Exp. Chem. (USA), vol.18, no.2, p.219-22 (March-April 1982). Translation of: *Teor. & Ekspr. Khim. (USSR)*, vol.18, no.2, p.253-6 (March-April 1982); [received: Feb. 1983]

The authors used the molecular probe method to investigate the dynamics of the change in the packing density during hardening of three-dimensional epoxide systems based on ED-20 and also evaluated the degree of heterogeneity of the resulting three-dimensional structures. (10 refs.)

61829 Effect of the filler on relaxational transitions in butadiene-methylstyrene copolymer. G.M.Bartenev, B.I.Revyakin, N.M.Lyalina, K.Boturov.

Vysokomol. Soedin. Ser. A (USSR), vol.25, no.3, p.511-16 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

In butadiene-methylstyrene copolymer being filled by carbon black ten relaxational transitions have been found above T_g : λ -transitions related with existence of macro-blocks of supersegmental and supermolecular structure of various nature, δ_1 and δ_2 -transitions related with the rearrangement and rupture of chemical S-S and C-C cross bonds, ϕ -transition related with the rearrangement of particles of the active filler. Introduction of the filler decreases the contribution of λ - and δ_2 -transitions. The correlation between temperatures of transitions calculated from the spectra of relaxation times (static method) and determined from the spectra of internal friction (dynamic method) is observed. (10 refs.)

61830 Structural features of smectic ordering in polymers with acrylate and methacrylate main chain. V.V.Tsukruk, V.V.Shilov, Yu.S.Lipatov, I.I.Konstantinov, Yu.B.Amerik.

Vysokomol. Soedin. Ser. A (USSR), vol.25, no.3, p.526-31 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

The structure of comb-like polymers with different main chains has been studied by small- and wide-angle X-ray scattering methods. The structural characteristics of polymers with various structure of side mesogenic groups were found (thickness of smectic layers, parameters of disordering of the layered packing, dimensions of layered stacks, fluctuations of electronic density). The layered structure in polymers with methacrylate main chains was shown to be essentially less perfect than in corresponding polymers with acrylate main chains. (16 refs.)

61831 Molecular mechanism of shrinkage of polyethylene terephthalate. P.M.Pakhomov, M.V.Shabilygin, B.A.Tsaplin, S.A.Baranova, Z.P.Vysotskaya. *Vysokomol. Soedin. Ser. A (USSR)*, vol.25, no.3, p.572-7 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

The molecular mechanism of shrinkage of amorphous oriented PETP has been studied by IR-spectroscopy method. The shrinkage phenomena in amorphous flexible polymers are shown to obey the rotational isomers mechanism related with the redistribution and change of the relative content of various conformers. The kinetic study of shrinkage shows that this process is related with cooperative conformational rearrangements in the field of molecular forces. (14 refs.)

61832 Morphology of polyallomers. V.P.Popov, Yu.K.Godovskii, Yu.M.Malinskii, N.M.Titova, V.A.Aulov, L.I.Bezruk, I.A.Litvinov.

Vysokomol. Soedin. Ser. A (USSR), vol.25, no.3, p.594-9 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

The morphology and some properties (density, crystallinity, T_m of both phases, temperatures of relaxational transitions) of polypropylene-polyethylene and polypropylene-polybutene-1 polyallomers have been studied by some physico-chemical and physical methods. The mutual influence of components on their crystallization was shown and the mechanism of this phenomenon was proposed. (15 refs.)

61833 Theoretical determination of crystalline structure of polyethylene. L.M.Borisanova, L.A.Zasurskaya, P.M.Zorkii.

Vysokomol. Soedin. Ser. A (USSR), vol.25, no.3, p.600-5 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

An approach to the theoretical prediction of crystalline structure of a polymer without use of experimental data about the packing of chains in a crystal has been worked out for PE. The theoretically possible packings of rhombic PE were obtained with the aid of the method of symmetry of potential functions of intermolecular interaction. The quantitative characteristics of these pack-

ings were determined by minimization of potential energy calculated in the atom-atom approximation. This approach permitted to choice of the limited number of variants including structures close to experimentally observed ones. (21 refs.)

61835 Kinetics of the collective crystallization of doped ZnS. F.K.Volynets, E.I.Gorokhova, A.D.Kashkai.

Inorg. Mater. (USA), vol.18, no.5, p.621-4 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.733-7 (May 1982). [received: Feb. 1983]

The effect of pressure on the mean grain size depends on the ratio of this pressure to the yield stress of the powder being pressed. If this ratio is less than one, then pressure promotes the preclusion of the inhibiting role of the pores and, thereby, promotes an increase in the mean grain size. When the ratio is greater than one, pressure is the cause of the plastic deformation of the grains and, consequently, of primary recrystallization coming into play. The mean grain size in the briquet which is obtained, as well as the energy of activation for the collective crystallization process, decrease. Readily fusible doping admixtures promote the compacting of the briquet and a growth in the mean grain size. It has been confirmed, using ZnS as the example, that collective recrystallization is dictated not by the grain size but by the extent, to which the angles at the triangular points deviate from 120° . (13 refs.)

61836 Determination of the Ising critical temperature of F slices with an application to garnet. J.J.M.Rijkema, H.J.F.Knops (Inst. of Theoretical Phys., Univ. of Nijmegen, Nijmegen, Netherlands), P.Bennema, J.P.van der Eerden.

J. Cryst. Growth (Netherlands), vol.61, no.2, p.295-306 (March 1983).

A general and simple method to calculate exactly the critical temperature for Ising nets on periodic structures is introduced. The method can be used to predict the morphological importance of F slices for realistic crystals. As an illustration it is applied to several types of garnet. The results are confronted with morphological data. (27 refs.)

61837 Growth kinetics of TGS. L.N.Rashkovich, V.T.Leshchenko, N.M.Sadykov (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.580-5 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.966-74 (Sept.-Oct. 1982). [received: April 1983]

The authors describe an interference method of registration of the growth rates of large anisotropic crystals in a stirred solution. They show that for crystallization in constant conditions the RMS deviation σ of the growth rate of the (001) face about its mean is 5-10%, 2-3 times greater than the

experimental error. There are also rare but marked $\{3\text{-}4\sigma\}$ variations in the mean rate. In some intervals of time, the growth rate is independent of changes in the supersaturation of the solution. The authors suggest that the variations in rate are not governed by the structure of the surface. (14 refs.)

61838 Features of the growth of potassium pentaborate crystals. V.N.Voitsekhovskii, V.P.Nikolaeva, I.A.Velichko. *Sov. Phys.-Crystallogr. (USA)*, vol.27, no.5, p.585-7 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.975-80 (Sept.-Oct. 1982). [received: April 1983]
Potassium pentaborate crystallizes from aqueous solutions in the form of twins with various habits, which are combinations of twinning on the planes $\{011\}$, $\{032\}$, and $\{001\}$. In twinning on $\{011\}$; the $\{111\}$ faces, which form the cap of the twinned concretion, have an enhanced growth rate owing to generation of growth layers at centers formed near the twin contact. Increase in the growth rate of individual faces of twinned concretions is a rather widespread phenomenon. (10 refs.)

61839 On the possibility of obtaining a uniform impurity distribution in growing crystals by the Bridgman-Stockbarger method. A.L.Mamyan, O.G.Nalbalyan (Sci.-Res. Inst. of Phys. of Condensed Media, State Univ., Erevan, USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.27, no.5, p.622-3 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1034-5 (Sept.-Oct. 1982). [received: April 1983]
Steady growth is characterized by the presence of a definite excess of impurity ahead of the crystallization front. The total number n of growth-fusion cycles is determined by the thoroughness of purification of the initial section (of length x_0) from impurity. The occurrence of convection in the melt, when the boundary diffusion layer is shorter than x_0 , can have a marked influence on the effect in question. The authors conclude, following their theoretical discussion, that in the Bridgman-Stockbarger method, a uniform impurity distribution can be obtained only with small crucible diameters. (2 refs.)

61840 Influence of capsule diameter on the impurity distribution in a growing crystal. V.Krivandina (Inst. of Crystallography, Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.27, no.5, p.623-4 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1036-7 (Sept.-Oct. 1982). [received: April 1983]
To elucidate the influence of the container diameter on the impurity distribution along the crystal, the authors chose growth conditions in which marked macroperiodicity arises in dibenzyl crystals with tolan as impurity. Single crystals up to 135 mm long were obtained in a crystallization apparatus for growing crystals 10 mm in diameter. To avoid large changes in the design and operation mode of the apparatus, crystals of smaller diameter were grown in glass tubes with internal diameters of 6.8 and 3.7 mm, placed within the 10 mm tubes. The authors show that in vertical directed crystallization of a binary mixture of dibenzyl and tolan from a melt, as the container diameter is reduced, convective mass exchange becomes more difficult. These results lead them to the conclusions that the transition from a convective to a diffusional mechanism of transport depends not only on the crystallization conditions but also on the diameter of the container. (4 refs.)

61841 Initial growth forms of single crystals of chromium with copper on its surface. V.M.Gennad'ev, A.A.Nosov, N.P.Ovsyannikov (Radiotech. Inst., Ryazan', USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.27, no.5, p.625-6 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1038-9 (Sept.-Oct. 1982). [received: April 1983]
The dynamics of formation of initial growth forms of chromium crystals were investigated by observing the crystal forms under the scanning electron microscope. The chromium crystals were formed by condensation of chromium from the vapor phase on a polycrystalline molybdenum substrate on which a layer of copper had been deposited. This was effected in a vacuum sputtering apparatus (residual gas pressure about 5×10^{-7} torr). The dynamics of formation of the relief of the chromium protuberances on the substrate surface was observed after stopping the deposition process at various stages. The results of X-ray microspectral analysis revealed that in this first stage the protuberances of chromium with hemispherical tops are covered by a film of copper. In the first stage of formation of the crystal, the presence of a layer of copper on the protuberances reduces the anisotropy of the growth rate and the surface energy. (6 refs.)

61.50E Crystal symmetry; models and space groups, and crystalline systems and classes

61842 Local symmetry points in crystal lattices. P.Kadura (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.963-73 (1982). In German.
The authors previously published a paper (see *ibid.*, vol.30, p.443, 1981) describing general methods how to find all local symmetry points of any crystal. The usefulness of these methods is demonstrated by applying it to actual lattices. (6 refs.)

New symmetry and structure for spinel See Entry 61885

61.50J Crystal morphology and orientation

61843 A method of calculating the rotation angle about a single rotation axis between any pair of measured crystallographic orientation relationships. K.Kobayashi (Dept. of Metal Sci. & Technol., Kyoto Univ., Kyoto, Japan), L.M.Hogan. *Met. Forum (Australia)*, vol.5, no.3, p.147-53 (Winter 1982).
A method of rotation is presented by which any departure from coincidence is expressed as a rotation angle. If the rotation angle is large, the two measured orientation relationships do not express the same relative orientation between the phases. The method is applicable to cubic crystals. (4 refs.)

61.50K Crystallographic aspects of polymorphic and order-disorder transformations

61844 Atomic ordering in solid solutions. V.V.Cherkashin, Yu.A.Vereshchagin, A.A.Kuranov, F.A.Sidorenko (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.2, p.394-6 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A study was made of the ranges of concentrations and temperatures in which superstructures were stable in $(Fe_{1-x}Mn_x)Pd$ solid solutions. The ranges of stability were deduced from X-ray diffraction data and from the temperature dependences of the paramagnetic susceptibility. It was found that a continuous series of solid solutions with the f.c.c. lattice was formed by the investigated system in the disordered state. Ordering took place below 935-890K giving rise to $L1_2$ superstructures in the range $0 \leq x \leq 0.45$ and to DO_{23} superstructures in the range $0.60 \leq x \leq 1.0$. (2 refs.) A.T.

61845 Study of $\alpha \rightleftharpoons \beta$ transition in americium. V.D.Shushakov, A.G.Seleznev, N.S.Kosulin, T.V.Shushakova. *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.2, p.405-7 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A detailed investigation was made of the transition occurring at $\sim 1044K$ in metallic americium: this transition transforms the double h.c.p. lattice into one with the f.c.c. structure. The study was carried out by the method of high-temperature X-ray diffraction. The rate of cooling or heating affected the transition temperature and so did an applied pressure. (5 refs.) A.T.

61846 Structural and thermal characterization of the γ'' polymorph of Bi_2MoO_6 . P.Gaucher, V.Ernst, P.Courtine (Dept. de Genie Chimique, Univ. de Technol. de Compiègne, Compiègne, France). *J. Solid State Chem. (USA)*, vol.47, no.1, p.47-52 (15 March 1983).
Among the different polymorphic phases of the Bi_2MoO_6 system, the intermediate γ'' compound has been characterized within a metastable state by high temperature X-ray diffraction and Raman spectroscopy. The transition $\gamma \rightleftharpoons \gamma''$ is found to be partially displacive and partially reconstructive. In the context of the ferroelectricity of γ , the nature of the paraelectric phase is discussed with the help of space group considerations and Buerger's theory of phase transitions. (8 refs.)

61.50L Crystal binding

61847 Fractionally charged ions in crystal lattices of organic ion-radical salts. L.Komorowski (Inst. of Organic & Phys. Chem., Tech. Univ. of Wrocław, Wrocław, Poland). *Chem. Phys. (Netherlands)*, vol.76, no.1, p.31-43 (1 April 1983).
The energy of an atom in a molecule is discussed on the basis of the definition of the chemical potential of electrons in a quantum system. An expression for the energy of the fractionally charged atom is proposed, and a master equation for the charge-dependent cohesive energy of a crystal is developed. Calculated net atomic charges in solid alkali halides are close to unity and their calculated cohesive energies indicate high percent of covalent bonding. The charge transfer at the energy minimum calculated for several organic, conducting ion-radical salts agree perfectly with the values determined experimentally. The lattice is stabilized by the charge transfer, although the ionic interactions reproduce only part of the crystal cohesive energy. (59 refs.)

61848 Monte Carlo simulations of solid nitrogen in the isothermal-isobaric ensemble with an ab initio SCF-CI potential. S.Romano, B.Jonsson, G.Karlstrom (Phys. Chem. 2, Chem. Centre, Lund, Sweden). *Int. J. Quantum Chem. (USA)*, vol.23, no.3, p.991-8 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).
Monte Carlo simulations in the isothermal-isobaric ensemble for the α phase of solid N_2 have been carried out with two different pair potentials obtained from ab initio quantum chemical calculations. Comparison is made with data obtained from empirical potentials as well as with experimental data, and in general, the agreement with experiment is found to be good. It is also found that the differences between experiment and theory can largely be attributed to correlation effects, not considered in the quantum mechanical calculations of the pair potential. (57 refs.)

61849 Nature of the chemical bond in titanium hydrocarbides. V.V.Nemoshkalenko, M.M.Kindrat, V.P.Krivitskii, B.P.Mamko, V.M.Prokopenko, A.I.Kharlamov (Inst. of Metallophys., Acad. of Sci., Ukrainian SSR). *Inorg. Mater. (USA)*, vol.18, no.5, p.669-72 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.795-9 (May 1982). [received: Feb. 1983]

In titanium hydrocarbides there is a hydrogen-carbon interaction. When hydrogen is absorbed by nonstoichiometric carbides, the hydrogen atoms occupy tetrahedral vacancies. The dissolution of hydrogen on nonstoichiometric titanium carbides does not lead to any change in the charge density in the spheres of the titanium and carbon atoms. (6 refs.)

61850 Basic-potential method for studying crystal potential. Y.Sakamoto, M.Miura, K.Hiraga, H.Murata (Hiroshima Univ., Hiroshima, Japan). *J. Sci. Hiroshima Univ. A (Japan)*, vol.46, no.2, p.267-336 (Jan. 1983).
The basic-potential (BP) method is reviewed, and is developed anew in many respects. It has a wide and neat applicability to a collective or accurate study of simple or complex crystals built by bond or antibond of various types: ionic, metallic, covalent, (electronutrally) molecular, and even pseudo-chemical types. Its comprehensiveness is supported from two sides. One is its cooperation with the lattice-complex method of describing the crystal structure. The other is its subsumptive unity in variety of potential peculiar to a bond type; thus Hund's and Jones's BP lump under Euler's BP, which then unites with Born's BP to form the Epstein zeta function. Euler's BP is raised to Birman's pair of BP's which can manage the source of force in an expanse-atom approximation. Two other kinds of standard potentials due to Naor and to Zucker are referred to. An effective coordination number is defined by reference to a crystal-potential factor. For the sake of the numerical application, basic formulas are arranged and available materials such as computer programs, tables, and graphs are listed. (124 refs.)

61851 Magnetism or bonding: a nearly periodic table of transition elements. J.L.Smith, E.A.Kmetko (Los Alamos Nat. Lab., Los Alamos, NM, USA). *J. Less-Common Met. (Switzerland)*, vol.90, no.1, p.83-8 (March 1983).
A table of the transition metal elements is constructed to show their dominant electronic features. The strictly periodic table of the elements is misleading

for the study of many useful metallic materials. The actinide series is central to this new view. (14 refs.)

- 61852 The crystal structure of R_2GaCo_2 compounds ($\text{R}=\text{Y}, \text{Tb}, \text{Dy}, \text{Ho}, \text{Er}, \text{Tm}, \text{Lu}$). R.E. Gladshchevskii, Yu.M. Gryn', Ya.P. Yarmolyuk. *Dopov. Akad. Nauk UkrSR. Ser. A (USSR)*, no.2, p.67-70 (1983). In Ukrainian.

The crystal structure of the Ho_2GaCo_2 was investigated by examining a single crystal using an autodiffractometer: space group Immm , $a=0.9294$, $b=0.9370$, $c=0.9804$ nm, 8 Ho in 8(n): $x=0.2194$; $y=0.1836$; $z=0$; 8 Ho in 8(f): $0; 0.3029; 0.2668; 8 \text{ Ho in } 8(m): 0.1968; 0; 0.3210$; 2 Ga in 2(d): $0.5; 0; 0.5$; 2 Ga in 2(b): $0; 0.5; 0.5; 4 \text{ Co in } 4(h): 0; 0.134; 0.5; 4 \text{ Co in } 4(f): 0; 0; 0.116$. The final R-value is equal to 0.104 for 350 reflections. Coordination numbers for atoms of Ho are 13-15, Ga—12-14, Co—9-10. The structure is represented as a framework of Ho atoms, whose icosahedral and cuboctahedral vacancies are filled with Ga atoms and tetragonalantiprismatic vacancies—with Co atoms. Other methods of vacancy filling are represented in structures of As_2Co , Al_2W , $\text{P}_2\text{Fe}_2\text{La}$. Compounds isostructural to Ho_2GaCo_2 are found in the Y, Tb, Dy, Er, Tm and Lu systems. Their crystallographic characteristics are given. (5 refs.)

- 61853 Electron microscope studies on the Sm-Co and Sm-Ni intermetallic compounds. S. Takeda (Hiroshima Univ., Hiroshima, Japan). *J. Sci. Hiroshima Univ. A (Japan)*, vol.46, no.2, p.149-94 (Jan. 1983). Polytopy structures and lattice defects in the ferromagnetic Sm-Co and Sm-Ni intermetallic compounds are investigated by electron microscopy. In Sm_2Ti and Sm_2Ti_9 (T; Co or Ni) compounds several different crystallographic modifications (polytypes) are found besides the previously known 2H and 3R modifications. Crystal structures of the new polytypes are analysed by the electron diffraction method. The technique of high-resolution electron microscopy is applied to study the defect structures in the Sm_2Ti_9 compounds. One- or two-dimensional lattice images are obtained in Sm-Co or Sm-Ni compounds, respectively. Various kinds of the defects are observed and the atomic arrangements are analysed: (1) Stacking faults in Sm_2Ti_9 , (2) Intergrowth with the Sm_2Ti structure or unknown structures in the matrix of Sm_2Ti_9 , (3) Complicated defect structures which change the stacking sequence of Sm_2Ni_9 , and (4) Lattice defects observed in terminating region of the intergrowth. (46 refs.)

- 61854 $\text{CaMn}_x\text{Al}_{2-x}$ and CaMn_xAl_8 ternary representatives of MgNi_2 and ThMn_{12} structures, respectively. E. Czech, G. Cordier, H. Schafer (Eduard-Zintl-Inst., Tech. Hochschule, Darmstadt, Germany). *J. Less-Common Met. (Switzerland)*, vol.90, no.1, p.109-19 (March 1983). In German.

The new compound $\text{CaMn}_x\text{Al}_{2-x}$ (with $0.16 \leq x \leq 0.32$) crystallizes in the hexagonal system (space group, $P6_3/mmc$) in the MgNi_2 structure with lattice constants $a=572.3(3)$ pm, $c=1826.4(5)$ pm and $c/a=3.191$. The new compound CaMn_xAl_8 crystallizes in the tetragonal system (space group, $I4/mmm$) with constants $a=895.7(1)$ pm, $c=516.8(1)$ pm and $c/a=0.577$. The structure corresponds to a ternary variant of the ThMn_{12} structure. (23 refs.)

- 61855 A low temperature crystal modification of the rare earth ternary compounds RCuSi . A. Iandelli (Istituto di Chimica Fisica, Univ. di Genova, Genoa, Italy). *J. Less-Common Met. (Switzerland)*, vol.90, no.1, p.121-6 (March 1983). RCuSi compounds of the trivalent rare earths were prepared in a low temperature modification. Their structure corresponds to the Ni_2In -derived type with an ordered arrangement of copper and silicon atoms in flat hexagonal layers. It appears to satisfy a condition common to other isostructural compounds, i.e. a valence electron concentration of 8/3. (8 refs.)

- 61856 The crystal structure of UMn_2 . A.C. Lawson (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA). *J. Less-Common Met. (Switzerland)*, vol.90, no.1, p.113-16 (March 1983). The author presents a re-analysis of the data of Marpo and Lander (1978), showing that at low temperatures UMn_2 has a more symmetric orthorhombic structure which is characterized by a single non-magnetic U-U nearest-neighbor distance. (2 refs.)

- 61857 Sr_2Pt_3 : an orthorhombic structure formed by Pt-centered trigonal prisms. M.L. Fornasini, A. Palenzona (Istituto di Chimica Fisica, Univ. di Genova, Genova, Italy). *J. Solid State Chem. (USA)*, vol.47, no.1, p.30-3 (15 March 1983). The phase Sr_2Pt_3 is orthorhombic with space group Pnma , and lattice constants $a=7.929(1)$, $b=24.326(6)$, $c=7.100(4)$ Å, $Z=4$. Direct methods were used for the structure resolution and anisotropic refinement led to an R value

of 0.065 for 535 reflections, collected on a four-circle diffractometer. The structure consists of trigonal prisms of Sr atoms centered by Pt and arranged in nets, analogous to those found in the Fe_2C and Mn_2C types. Differently from Fe_2C (isolated nets) and Mn_2C (double nets), the nets are here joined three by three through prism edges, forming slabs along the b axis. A description of the structure in terms of unit cell microtwinning is provided. (12 refs.)

- 61858 Magnetic and structural characteristics of $\text{Ho}_2\text{Fe}_{23}$ deuterides. A.T. Pedziwiatr, H.K. Smith, W.E. Wallace (Dept. of Chem., Univ. of Pittsburgh, Pittsburgh, PA, USA). *J. Solid State Chem. (USA)*, vol.47, no.1, p.41-6 (15 March 1983). The pressure-composition isotherm of the $\text{Ho}_2\text{Fe}_{23}\text{-D}_2$ system at 0°C was established, revealing the presence of two plateau regions. Using the isotherm, five compositions of the $\text{Ho}_2\text{Fe}_{23}\text{-D}_x$ system ($x=0, 1.5, 8.2, 12.1, 15.7$) were selected for investigation. These were examined by X-ray diffraction and magnetization measurements. The cubic lattice of the host metal is maintained to $x=8.2$. A tetragonal structure develops at $x=12.1$, but this reverts to cubic symmetry at the highest deuterium concentration studied. The observed structural changes are ascribed to preferential site occupancies by deuterium. Absorption of 15.7 deuterium atoms per formula unit in $\text{Ho}_2\text{Fe}_{23}$ caused a 10.2% increase of the unit cell volume. Increase in the deuterium content resulted in a striking increase in the Curie temperature T_c and in a linear decrease in compensation temperature T_{comp} . The saturation magnetization changed smoothly as the system changed from one structure type to another. There appears to be a significant increase in Fe magnetic moment upon deuterium absorption, which is ascribed to the removal of electrons from the 3d ion band by deuterium. (16 refs.)

- 61859 The crystal structure of La_3NiGe_2 and allied compounds. O.I. Bodak, V.A. Bruskov, V.K. Perchanskii (State Univ., Lvov, Ukrainian SSR). *Sov. Phys.-Crystallogr. (USA)*, vol.27, no.5, p.538-40 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.896-9 (Sept.-Oct. 1982). [Received: April 1983]

The authors determine the crystal structure of the compound La_3NiGe_2 (space group Pnma), $a=12.041(5)$ Å, $b=4.358(2)$ Å, $c=11.871(6)$ Å, $Z=4$, which is of a new structural type. The atomic parameters are refined by the method of least squares in the isotropic ($R=0.068$) and anisotropic ($R=0.053$) approximations by means of 631 independent reflections ($I>1.96\sigma$) measured in a Syntex P2₁ automatic diffractometer. The compound La_3NiGe_2 belongs to a class of structures with trigonal-prismatic coordination of the smallest atoms (Ni and Ge) and is a filled-in analog of the previously known type Hf_3P_2 . The authors establish the existence of another ten previously unknown compounds R_3NiGe_2 of the structural type of La_3NiGe_2 ($\text{R}=\text{Y}, \text{Ce}, \text{Pr}, \text{Nd}, \text{Sm}, \text{Gd}, \text{Tb}, \text{Dy}, \text{Ho}, \text{Er}$). (10 refs.)

- 61860 The unit-cell dimensions of phases of Cu, Ag, or Au with the CsCl structure. E. Hellner (Inst. für Mineralogie, Petrologie & Kristallographie, Philipps-Univ., Marburg/Lahn, Germany), W.B. Pearson. *Z. Kristallogr. (Germany)*, vol.161, no.1-2, p.91-102 (1982). The unit-cell dimensions of phases with the CsCl structure that contain Cu, Ag or Au (A) are examined as a function of the diameters of the component atoms, D_A and D_B , and compared with those of phases of other A components. The cell dimensions of phases with upper composition of the B component limited by an electron concentration of 1.5 electrons per atom are controlled by the A-B contacts. The cell dimensions of phases containing the rare earths (B) controlled by the A-B and B-B contacts acting conjointly. The Li and Mg phases of Ag and Au have unusually small cell dimensions. Whereas the Ag and Au phases with composition limited by electron concentration 1.5 have the same cell sizes, the Li, Mg, Sc, Y and rare earth phases of Au have cell sizes on the average 0.051 Å smaller than the Ag phases. This is accounted for in terms of the electronegativity differences for this group of Au phases. The Au phases of the alkali metals are discussed; the size of the Au^- ion is deduced; the essential metallic nature of AuLi is demonstrated, and the nonexistence of AuNa and AuK is rationalized. The AgMg phase with a range of homogeneity, is considered in detail. (18 refs.)

61.60 SPECIFIC STRUCTURE OF INORGANIC COMPOUNDS

- 61861 On a new series of cobalt+IV oxides. R. Salmon (Lab. de Chimie du Solide, CNRS, Talence, France), V. Linh. *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.1, p.53-5 (10 Jan. 1983). In French.

A new series of cobalt(+IV) compounds with general formula $\text{Ba}_4\text{Ln}_2\text{Co}_3\text{O}_{13}$ ($\text{Ln}=\text{Y}, \text{Nd-Yb}$) has been prepared and characterized. According to the X-ray diagram the unit cell is hexagonal. Magnetic susceptibility vs. temperature measurements give evidence of high spin Co^{4+} ions occupying tetrahedral sites. (3 refs.)

- 61862 Crystal structure of $\text{La}_2\text{Mn}_2\text{Ga}_2\text{Si}_4$. N. Rodier, M. Guittard, J. Flahaut (Lab. de Chimie Minérale, Chateaufort-Malabry, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.1, p.65-70 (10 Jan. 1983). In French.

A hexagonal system, $\text{p}6_3$, $a=10.215(6)$ Å; $c=6.024(4)$ Å, $Z=1$. $R_w=0.039$ is found for 725 reflections ($I>2\sigma(I)$). All the metallic sites are fully occupied. The coordination polyhedra are: distorted dicapped trigonal prism for La, triangular antiprism for Mn (B site), tetrahedron for Ga (C site). The Mn atom is almost at the centre of the antiprism. This structure is the fundamental type for a large family of compounds having the formula $\text{R}_6[\text{B}_6]\text{C}_{12}\text{X}_{14}$ with $n=1/2, 2/3, 1$ or $4/3$; R-trivalent rare earth, B=3d, 1b, 11b or 111a... elements, C=111a, IV_A or V_A elements, X=S, Se. (16 refs.)

- 61863** Two new phases with tetragonal bronze-like structure in the diagram: $K_2O-CdO-Nb_2O_5$. J.Thoret (Lab. de Chimie Minérale, Univ. Pierre-et-Marie-Curie, Paris, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.2, p.139-41 (17 Jan. 1983). In French.
- Some new 'tetragonal tungsten bronzes' phases have been obtained in the $K_2O-CdO-Nb_2O_5$ ternary diagram. Crystallographic, dielectric and nonlinear optical measurements have been performed. All these materials are piezoelectric at room temperature. Ferroelectric-paraelectric transitions appear at low temperature for some of them. (7 refs.)
- 61864** New cationic deficient phases $Bi_{12}[B_4]^{+V}[\square]_{1/5}O_{20}$ with sillenite structure. M.Devallet, G.Meunier, J.-P.Manaud, P.Hagenmuller (Univ. de Bordeaux I, Talence, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.3, p.189-91 (24 Jan. 1983). In French.
- New cationic deficient phases $Bi_{12}[B_4]^{+V}[\square]_{1/5}O_{20}$ ($B^{+V}=P, As, V$) with sillenite structure have been obtained. At high temperature a reversible allotropic transformation may be detected. Transition temperatures and unit cell parameters have been determined. (8 refs.)
- 61865** The isostructural sulfides: Sr_2SnS_6 and Eu_2SnS_6 . M.Guittard, S.Jaulmes, M.Julien-Pouzol, E.Barthelemy, J.Flahaut (Lab. de Chimie Minérale Structurale, Paris, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.4, p.249-51 (31 Jan. 1983). In French.
- Preparation and identification of two bimetallic sulfides, formed by tin IV with strontium or europium II and having, in addition to isolated S^{2-} anions, polysulphide chains formed by 3 sulphur atoms. Crystallographic and magnetic studies of Eu_2SnS_6 are also presented with the thermal decomposition of the two isomorphous compounds. (7 refs.)
- 61866** New complex antimonates and tellurates structurally related to lithium antimonate $LiSbO_3$. P.Tarte, M.Gabelica-Robert (Univ. de Liege, Liege, Belgium). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.4, p.261-4 (31 Jan. 1983). In French.
- New antimonates and tellurates $LiM_2^{III}SbO_6$, $LiM^{III}M^{IV}SbO_6$ and $LiM^{III}M^{IV}TeO_6$ have been synthesized and investigated by X-ray diffraction and vibrational spectroscopy. All these compounds are orthorhombic and structurally related to $LiSbO_3$ but the cation distribution is ordered in antimonates $LiM_2^{III}SbO_6$ and tellurates, whereas it is very probably disordered in antimonates $LiM^{III}M^{IV}SbO_6$. (3 refs.)
- 61867** Structural approach of the Nd_3GaO_6 compounds. J.Coutures, J.Nicolas (CNRS, Lab. des Ultra-Refractaires Odeillo, Font, Romeu, France), E.Antic, G.Schiffmacher, J.-P.Coutures. *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.5, p.347-9 (7 Feb. 1983). In French.
- A structural study of the Nd_3GaO_6 compound by X-ray and electron diffraction shows that Nd_3GaO_6 is orthorhombic, space group $Pnna(D_{2h}^{16})$ with four units by cell. Optical absorption indicates that Nd^{3+} is on three sites with an average coordination number of 7. Nd_3GaO_6 is stable up to $1290^\circ C$. (3 refs.)
- 61868** First compounds containing only isolated Mo_9 clusters in Mo_9Se_{11} units: $Ag_4Mo_9Se_{11}(x=4)$ and $Ag_3Mo_9Se_{11}$. P.Gougeon, M.Potel, J.Padiou, M.Sergent (Lab. de Chimie Minérale B, Univ. de Rennes-Beaulieu, Rennes, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.5, p.351-6 (7 Feb. 1983). In French.
- First compounds containing only isolated Mo_9 clusters in Mo_9Se_{11} units have been synthesized: $Ag_4Mo_9Se_{11}(x=4)$, $Ag_3Mo_9Se_{11}$. In these new phases, all silver atoms are delocalized in the channels around Mo_9Se_{11} units. (7 refs.)
- 61869** Structure of thorium sulphate octahydrate, $Th(SO_4)_3 \cdot 8H_2O$. J.Habash, A.J.Smith (Dept. of Chem., Univ. of Sheffield, Sheffield, England). *Acta Crystallogr. Sect. C (Denmark)*, vol.C39, pt.4, p.413-15 (15 April 1983). $M_r=568.3$, monoclinic, $P2_1/n$, $a=8.51$ Å, $b=11.86$ (2) Å, $c=13.46$ (2) Å, $\beta=92.65$ (1)°, $V=1357$ Å³, $Z=4$, $D_x=2.778$, $D_m=2.78$ g cm⁻³ (by flotation in iodobenzene/diiodomethane), $Mo\ K\alpha$, $\lambda=0.7107$ Å, $\mu=137.95$ cm⁻¹. Non-hydrogen atoms refined anisotropically to a final R of 0.1022. The thorium is ten-coordinate, both the sulphate groups being chelate, and six of the water oxygens being coordinated to thorium. The resulting complexes are linked together via hydrogen bonds. The thorium coordination polyhedron approximates closely to the bicapped square antiprism (1.4/4.1) of D_{4d} symmetry and with $\theta=63^\circ$. (12 refs.)
- 61870** $Mo_6Br_8S_8$: a new two-dimensional compound with octahedral Mo_6 clusters. C.Perrin, M.Potel, M.Sergent (Lab. de Chimie Minérale B, Univ. de Rennes, Rennes, France). *Acta Crystallogr. Sect. C (Denmark)*, vol.C39, pt.4, p.415-18 (15 April 1983). In French.
- $M_r=1151.3$, orthorhombic, $Cmcm$, $a=17.250$ (7), $b=6.600$ (4), $c=11.929$ (7) Å, $Z=4$, $V=1358$ Å³, $D_x=5.51$, $D_m=5.63$ Mg m⁻³, $\lambda(Mo\ K\alpha)=0.71069$ Å, $\mu(Mo\ K\alpha)=24.34$ mm⁻¹, $F(000)=2040$. The structure has been solved by direct methods and refined by least squares to $R=0.062$ ($R_w=0.052$) for 423 independent reflections. The structure can be described as a layer structure of $[Mo_6]_4$ units. Along c , these units are bonded by their apices to build up chains. Along b , these chains are linked by $Mo-S$ bonds. Along a , the cohesion is made only by contacts between Br atoms, leading to a two-dimensional character for this compound. (21 refs.)
- 61871** Structure of cadmium hydroxynitrate, $Cd(OH)(NO_3)$. A.-M.Rodriguez Roldan, M.Louer, J.-P.Auffredic, D.Louer (Lab. de Cristallographie, Univ. de Rennes, Rennes, France). *Acta Crystallogr. Sect. C (Denmark)*, vol.C39, pt.4, p.418-20 (15 April 1983). In French.
- $M_r=191.4$, orthorhombic, $P2_12_12_1$, $a=3.891$ (3), $b=7.407$ (4), $c=11.249$ (6) Å, $V=324.2$ (6) Å³, $Z=4$, $D_x=3.921$ Mg m⁻³, $F(000)=352$, $\lambda(Mo\ K\alpha)=0.71069$ Å. The structure has been solved from single-crystal data collected on a four-circle diffractometer by Patterson and Fourier syntheses. With anisotropic temperature factors, the final R value is 0.028 for 665 independent observed reflections. The NO_3 groups are symmetric bidentate and the Cd atoms are hexacoordinated by three $O(NO_3)$ and three OH groups, these polyhedra sharing corners in the [100] and [010] directions and edges in the [001] direction. (10 refs.)
- 61872** Structure refinement of mathiasite, $(K_{0.62}Na_{0.14}Ba_{0.16}Sr_{0.10}Th_{0.21}Ti_{12}Co_{10}Mg_1S_3Fe_{12}Zr_{0.6}Ca_{0.2}V_{0.1}Nb_{0.1}Al_{0.36}O_{38})$. B.M.Gatehouse (Dept. of Chem., Monash Univ., Clayton, Victoria, Australia), I.E.Grey, J.R.Smyth. *Acta Crystallogr. Sect. C (Denmark)*, vol.C39, pt.4, p.421-2 (15 April 1983). $M_r=1693.08$, rhombohedral, $R\bar{3}$, $a=9.119$ (3) Å, $a_c=69.24$ (2)°, $Z=1$, $D_x=4.39$ g cm⁻³, $\lambda(Mo\ K\alpha)=0.71069$ Å, $\mu=68.8$ cm⁻¹. Final $R=0.054$ for 892 observed independent diffractometer data. Mathiasite is isostructural with the crichtonite-group minerals, AM_2O_{38} , and is characterized by dominant potassium in the large-cation A site. Partial disorder in the M -cation sublattice is

interpreted as due to the partial occupation of a second anion site by large cations. (9 refs.)

- 61873** Tetradecapraseodymium hexanickel undecasilicide, $Pr_{12}Ni_6Si_{11}$, with centered trigonal rare-earth prisms. E.Hovestvedt, K.Klepp, E.Parthe (Lab. de Cristallographie aux Rayons X, Univ. de Geneve, Geneve, Switzerland). *Acta Crystallogr. Sect. C (Denmark)*, vol.C39, pt.4, p.422-5 (15 April 1983). $M_r=2634$, monoclinic, $C2/m$, $a=33.991$ (3), $b=4.2328$ (4), $c=21.330$ (3) Å, $\beta=113.72$ (1)°, $V=2809.7$ Å³, $Z=4$, $D_x=6.226$ Mg m⁻³, $Mo\ K\alpha$, $\lambda=0.71069$ Å, $\mu=27.99$ mm⁻¹, $F(000)=4592$, $T=293K$, $R=0.072$ for 2540 independent reflections. The structure consists of an arrangement of Ni- and Si-centered trigonal prisms of Pr atoms with two mutually perpendicular prism-axis directions. The Ni and Si atoms on the prism-center sites are ordered. A Ni atom has neither a Pr atom nor another Ni atom in prism-wise contact. The $Pr_{14}Ni_6Si_{11}$ structure is geometrically related to the $Ce_{14}(Ni, Si)_{17}$ structure. They can be considered as stacking variants of each other. (11 refs.)
- 61874** Neptunium tetrafluoride hydrate, $Np_2F_{12} \cdot H_2O$. A.Cousson, H.Abazli, M.Pages, M.Gasperin (Univ. Pierre et Marie Curie, Paris, France). *Acta Crystallogr. Sect. C (Denmark)*, vol.C39, pt.4, p.425-7 (15 April 1983). In French.
- $M_r=957$, triclinic, $P1$, $a=8.455$ (8), $b=8.858$ (9), $c=8.396$ (10) Å, $\alpha=113.83$, $\beta=116.64$, $\gamma=58.03^\circ$, $Z=2$, $V=465.2$ Å³, $D_x=6.83$ Mg m⁻³, $\lambda(Mo\ K\alpha)=0.71069$ Å, $F(000)=774$, $R(F)=0.079$, $R_w=0.104$ for 2848 independent reflections. Three kinds of F polyhedra surrounding Np are linked in a three-dimensional framework. Np-F distances vary between 2.18 (3) and 2.78 (4) Å; the shortest F-F is 2.44 (7) Å. Water molecules are located in the holes, respectively, at 2.54 (13) and 2.43 (10) Å from Np atoms. (2 refs.)
- 61875** Physicochemical properties of alloys of HgTe-MgTe system. V.M.Frasunyak, N.P.Galvalashko, I.A.Parenjuk (Chernovitsy State Univ., Chernovitsy, Ukrainian SSR). *Inorg. Mater. (USA)*, vol.18, no.6, p.882-4 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1045-7 (June 1982). [received: Feb. 1983]
- Presents results from a physicochemical study of the HgTe-MgTe system (up to 20 mole% MgTe). The crystals were obtained by joint fusion of the original elements. The specimens were investigated by means of DTA and X-ray phase analysis; also, the hydrostatic density and microhardness were measured. In determining the elementary cell constants, the authors used precision photography with monochromatic Fe $K\alpha$ radiation. The X-ray parameters were used to calculate the density of the substance for a comparison with the density determined by hydrostatic weighing. (8 refs.)
- 61876** Cation distribution in the cupromanganese spinel $Cu_{0.5}Mn_{2.5}O_4$. S.E.Tsirkunova, Ya.O.Shint (Inst. of Phys., Acad. of Sci., Latvian SSR). *Inorg. Mater. (USA)*, vol.18, no.6, p.899-900 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1060-1 (June 1982). [received: Feb. 1983]
- The spinel $Cu_{0.5}Mn_{2.5}O_4$ is tetragonal with the unit cell parameters $a=8.16$ Å, $c=8.95$ Å, and a Curie temperature below room temperature. For determining the crystal structure of this spinel the authors photographed its neutron diffraction pattern at room temperature. Analysis of the neutron diffraction pattern showed that the structure of this spinel has space group D_{4h}^{19} . (6 refs.)
- 61877** The crystal structure of Re_2Ge_7 . T.Siegrist, F.Hulliger (Lab. fur Festkörperphys., Eidgenössische Tech. Hochschule, Zurich, Switzerland), W.Petter. *J. Less-Common Met. (Switzerland)*, vol.90, no.1, p.143-51 (March 1983).
- The only normal pressure phase in the system Re-Ge was shown to possess the composition Re_2Ge_7 instead of $ReGe_2$ as reported in the literature. Re_2Ge_7 crystallizes in the space group $Cmcm$ with the orthorhombic cell lattice constants $a=3.227$ (1) Å, $b=9.045$ (1) Å, $c=21.956$ (2) Å, $Z=4$ and $d_x=11.06$ g cm⁻³. Its structure represents a new type which can be derived from a combination of the $PuBr_3$ type and the $OsGe_2$ type. (13 refs.)
- 61878** On basic thallium sulfates: structure of $Tl_2TiOH(SO_4)_2$. F.Abraham (Univ. de Valenciennes, Valenciennes, France), G.Nowogrocki, B.Jolibois, G.Laplace. *J. Solid State Chem. (USA)*, vol.47, no.1, p.1-5 (15 March 1983).
- The $Tl_2TiOH(SO_4)_2$ compound is monoclinic, $a=7.758$ (3), $b=17.587$ (9), $c=7.356$ (3) Å, $\beta=119.91$ (3)°, $SG\ C2$, $Z=4$. The structure was solved by full-matrix least square refinement to $R=0.033$ from 1242 single-crystal reflections collected on an automated diffractometer. Tl^{III} ions ensure bonding between $[Ti^{IV}OH(SO_4)_2]_{\infty}$ sheets. These sheets may be viewed as crisscrossing $Ti-SO_4$ chains. In the [101] direction, the linking of Tl^{III} is reinforced by bidentate OH groups, so the usual hexacoordination of trivalent thallium is preserved. A transition occurring at $104^\circ C$ is under investigation. (10 refs.)
- 61879** Structural chemistry of Magneli phases Ti_nO_{2n-1} ($4 \leq n \leq 9$). III. Valence ordering of titanium in Ti_5O_{11} at $130K$. Y.Le Page, P.Strobel (Nat. Res. Council of Canada, Ottawa, Ontario, Canada). *J. Solid State Chem. (USA)*, vol.47, no.1, p.6-15 (15 March 1983).
- For $Pt.II$ see *ibid.*, vol.44, no.2, p.273 (1982). The phase transition at $147K$ in Ti_5O_{11} corresponds to the occurrence of a superstructure with tripling of the cell volume on cooling. Its reduced cell parameters at $130 \pm 5K$ are $a=5.17$ (1), $b=11.98$ (2), $c=13.397$ (2) Å, $\alpha=88.29$ (1), $\beta=105.52$ (1), and $\gamma=107.79$ (1) degrees in space group $P1$ with $Z=6$. A systematic nomenclature adding one index to the substructure atom names permits calculation of the model's atomic coordinates in the asymmetric unit in terms of the rutile sub-substructure and keeps track of the structural changes. The superstructure was solved by direct methods and refined to $R_F=5.2\%$ on 3062 observed reflections assuming isotropic thermal motion. A complex pattern of Ti-O and Ti-Ti distance changes is observed. It is interpreted to correspond to valence ordering of the Ti atoms, probably complete in the shear-plane slab and partial in the rutile-like slab. The Ti-Ti distances, with one very short approach of 2.65 Å at a shared face, seem to be consistent with 'bipolarons' but can also be analyzed in terms of electrostatic repulsion which allows for the considerable lengthening of some distances as well. (11 refs.)
- 61880** Crystal structure and magnetic properties of a new form of NH_4MnFeF_6 . M.Lebanc, G.Ferey, Y.Calage, R.de Pape (Lab. des Fluorures et Oxyfluorures Ioniques, ERA, Le Mans, France). *J. Solid State Chem. (USA)*, vol.47, no.1, p.24-9 (15 March 1983).
- The hydrothermal synthesis at $380^\circ C$, 200 MPa of NH_4MnFeF_6 , NH_4MnCrF_6 , and $RbMnFeF_6$ leads to a new $AM^{II}M^{III}F_6$ structural type of orthorhombic symmetry with $Z=8$. The lattice constants are found to be, respectively, $a=7.844$ (4), $b=12.819$ (8), $c=10.582$ (6); $a=7.808$ (5), $b=12.755$ (9), $c=10.501$ (7); and $a=7.913$ (5), $b=12.858$ (9), $c=10.619$ (5). The structure was solved for NH_4MnFeF_6 from 755 X-ray reflections and refined to $R_w=0.029$ in the space group $Pb2n-C_6^2$. The network is built from edge-sharing $MnFeF_6$ bioctahedra connected to each other by their vertices.

RbMnFeF₆, upon heating, transforms irreversibly to the modified pyrochlore structure at 881 K. From magnetic and Mossbauer experiments, NH₄MnFeF₆ and NH₄MnCrF₆ are established to be antiferromagnetic with $T_N = 117.7 \pm 0.5$ K and < 6 K, respectively. (17 refs.)

61881 Electron microscopic study of barium hexaaluminates. N.Iyi, S. Takekawa, Y. Bando, S. Kimura (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).

J. Solid State Chem. (USA), vol. 47, no. 1, p. 34-40 (15 March 1983). The crystallographic relation between phase I and phase II of barium hexaaluminates, which were conventionally considered as the single compound 'barium hexaaluminate (BaAl₂O₁₉)', was investigated using principally the electron diffraction method. Phase I (Ba_{0.79}Al_{10.9}O_{17.14}) was found to have a β -alumina type structure with space group $P6_3/mmc$. On the other hand, phase II (Ba_{2.34}Al_{21.0}O_{33.84}) exhibited an $a\sqrt{3} \times a\sqrt{3}$ superstructure, which is probably due to the ordering of excess Ba ions within Ba-O layers. Possible structure models of both phases are presented. (16 refs.)

61882 Hexagonal tungsten bronze-type Fe^{III} fluoride: (H₂O)_{0.33}FeF₃; crystal structure, magnetic properties, dehydration to a new form of iron trifluoride. M. Leblanc, G. Ferey, P. Chevallier, Y. Calage, R. de Pape (Lab. des Fluorures et Oxyfluorures Ioniques, ERA, Le Mans, France).

J. Solid State Chem. (USA), vol. 47, no. 1, p. 53-8 (15 March 1983). (H₂O)_{0.33}FeF₃, grown by hydrothermal synthesis, crystallizes in the orthorhombic system with cell dimensions $a = 7.423(3)$ Å, $b = 12.730(4)$ Å, $c = 7.526(3)$ Å, and space group $Cmcm$, $Z = 12$. The structure, derived from single crystal X-ray diffraction data (605 independent reflections) is refined to $R = 0.019$ ($R_w = 0.021$). The framework of the Fe^{III}Fe₆ octahedra is related to that of hexagonal tungsten bronze (HTB) Rb_{0.29}WO₃. At 122°C, a zeolitic water is evolved from hexagonal tunnels without any noticeable change of the fluorine skeleton. The related anhydrous compound represents a new form of iron trifluoride which is denoted HTB-FeF₃; at 525°C, it transforms into the cubic form of ReO₃-type. (H₂O)_{0.33}FeF₃ and HTB-FeF₃ are antiferromagnetic, with Neel temperatures of $T_N = 128.7 \pm 0.5$ K and $T_N = 97 \pm 2$ K, respectively. (13 refs.)

61883 Zirconium dodecarbides ZrB₁₂. Confirmation of the B₁₂ cubooctahedral unit. C.H.L. Kennard (Dept. of Chem., Univ. of Queensland, St. Lucia, Queensland, Australia), L. Davis.

J. Solid State Chem. (USA), vol. 47, no. 1, p. 103-6 (15 March 1983). Using powder, neutron diffraction and Rietveld's method of profile refinement, the structure of ZrB₁₂ was confirmed. (5 refs.)

61884 Crystal structure of a metallic two-dimensional conductor: the purple bronze of potassium and molybdenum, K_{0.9}Mo₆O₁₇. H. Vincent, M. Ghedira (Lab. de Cristallographie, CNRS, Grenoble, France), J. Marcus, J. Mercier, C. Schlenker.

J. Solid State Chem. (USA), vol. 47, no. 1, p. 113-21 (15 March 1983). In French.

Single crystals of the purple bronze K_{0.9}Mo₆O₁₇ have been grown by an electrolytic reduction technique. Measurements of the electrical resistivity show that this compound is a quasi two-dimensional metal. A crystal structure determination is used to explain the strongly anisotropic resistivity. K_{0.9}Mo₆O₁₇ is found to be trigonal with lattice parameters: $a = 5.538$ Å and $c = 13.656$ Å; $Z = 1$. The space group is $P3_1$. Zachariasen's (1978) bond length-bond strength relation has been applied to the Mo-O bonds. The computed effective mean Mo valences are +6 for Mo(1) on tetrahedral sites and about 5.1 and 5.8, respectively, for Mo(2) and Mo(3) on octahedral sites. The 4d electrons of Mo atoms are so located in the two-dimensional infinite slabs of octahedra. The 4d electrons of Mo atoms are so located in the two-dimensional infinite slabs of octahedra. The conduction band is expected to be an antibonding π^* band resulting from the hybridization of the Mo 4d t_{2g} and oxygen p_z states. The structural properties should lead to a very anisotropic Fermi surface and thus, to a quasi two-dimensional electrical conductivity. (15 refs.)

61885 New symmetry and structure for spinel. N.W. Grimes, P. Thompson (Dept. of Phys., Univ. of Aston, Birmingham, England), H.F. Kay.

Proc. R. Soc. London Ser. A (GB), vol. 386, no. 1791, p. 333-45 (8 April 1983). The crystal structure of magnesium aluminate is conventionally described within a symmetry corresponding to the centrosymmetrical space group Fd3m but this has created difficulties for the interpretation of many of its physical properties. Therefore, extensive X-ray diffraction intensity data have been collected from a small spherical synthetic single crystal and used for a structure parameter refinement assuming F43m symmetry as proposed by Grimes (1972), and also for refinement according to conventional symmetry. The F43m assumption yields the first direct measurement of the suspected deviations from the centrosymmetrical structure, and is found to provide a significantly superior fit to the experimental data, especially at high angles and with reflexions having structure factors less than 10.0. The weak reflexions include nine that are forbidden under Fd3m symmetry and it is shown that there is satisfactory agreement between observed and calculated structure factors in these cases. (48 refs.)

61886 X-ray study of niobium disulfide intercalated with copper. W. Thulke, R. Frahm, R. Haensel, P. Rabe.

Phys. Status Solidi A (Germany), vol. 75, no. 2, p. 501-9 (16 Feb. 1983). Bondlengths of nearest neighbours around the Cu and Nb atoms in a Cu_{0.5}NbS₂ single crystal are extracted from the extended X-ray absorption fine structure (EXAFS) and lattice parameters are measured by X-ray diffraction. It is found that the Cu atoms occupy tetrahedral sites in the Van der Waals gap. Upon intercalation the NbS₂ sandwiches are squeezed by 0.009 nm whereas the van der Waals gap expands by 0.067 nm. The Nb-Nb distance in the NbS₂ layers increases by 0.003 nm. The Nb-S bond length shortens by 0.001 nm. The positions of the K-edge energies indicate a charge transfer from the Cu atoms to the host sandwich layers. (24 refs.)

61887 Change in the valence of samarium ions in solid solutions based on isostructural SmB₆ phases. M.I. Aivazov, S.V. Aleksandrovich, B.A. Evseev, V.S. Mkrtchyan, V.N. Sorokin, O.M. Tsarev (Sci.-Industrial Assoc., 'Energiya', Moscow, USSR).

Sov. Phys.-Solid State (USA), vol. 24, no. 9, p. 1512-14 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol. 24, no. 9, p. 2667-71 (Sept. 1982). [received: April 1983] Experimental values of lattice constants yielded the dependences $\epsilon(x)$ of the fraction of Sm^{2+} ions on the composition in the systems of solid solutions $\alpha\text{-SmB}_6\text{-Me}_x^{1+}\text{B}_6$ (Me = La, Ce, Pr, Nd) and $\beta\text{-SmB}_6\text{-Me}_x^{1+}\text{B}_6$ (Me = Nd, Gd). The change in valence for solid solutions based on $\alpha\text{-SmB}_6$ was appreciably greater than for those based on $\beta\text{-SmB}_6$. (12 refs.)

61888 Determination of crystal structure of triple magnesium calcium sodium orthophosphate Mg₂₁Ca₉Na₄(PO₄)₁₈. A.I. Domanskii, Yu.I. Smolin, Yu.F. Shepelev, J. Majling (Inst. of Silicate Chem., Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol. 27, no. 5, p. 535-7 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol. 27, no. 5, p. 891-5 (Sept.-Oct. 1982). [received: April 1983]

The crystal structure of Mg₂₁Ca₉Na₄(PO₄)₁₈ ($a = 14.974(4)$ Å, $c = 42.74(1)$ Å, R_3 , $Z = 6$) is determined by direct methods and refined by the method of least squares in the anisotropic approximation to $R = 0.038$. A diffractometer is used to measure 3800 F(hkl). A crystal-chemical description of the structure is given. (10 refs.)

61889 The crystal structure of the deuteride ZrMoFeD_{2.6}. V.A. Yartys', V.V. Burnasheva, N.V. Fadeeva, S.P. Solov'ev, K.N. Semenenko (Inst. of New Chem. Problems, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol. 27, no. 5, p. 540-3 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol. 27, no. 5, p. 900-4 (Sept.-Oct. 1982). [received: April 1983]

Powder neutron diffraction is used to investigate the crystal structure of the deuteride ZrMoFeD_{2.6}, which is an interstitial derivative of the structural type of MgZn₂. It is found that the deuterium atoms in the structure of ZrMoFeD_{2.6} occupy tetrahedral gaps [GZr₂(MoO₅ + FeO₅)₂] of two types. (12 refs.)

61890 Crystal structure of Ge sodalite Na₈Al₆Si₆O₂₄(OH)₂. E.L. Belokoneva, L.N. Dem'yanets, T.G. Uvarova, N.V. Belov (Inst. of Crystallography, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol. 27, no. 5, p. 597-8 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol. 27, no. 5, p. 995-6 (Sept.-Oct. 1982). [received: April 1983]

The composition Na₈Al₆Si₆O₂₄(OH)₂·nH₂O corresponds to two natural minerals-natrodavnye and sodalite. With the aim of determining the influence of replacement of Si by Ge in sodalite, the authors synthesized single crystals of its germanium analog and investigated its structure. Crystals of the germanium analog of sodalite were obtained in hydrothermal conditions by means of a temperature difference. The parameter of the cubic primitive unit cell, $a = 9.029(5)$ Å, was determined on a spherical specimen on a PI Syntex automatic diffractometer. Three-dimensional data required for structural determination were obtained in the same diffractometer (Mo K α , $\sin \theta/\lambda \leq 1$ Å⁻¹, $2\theta/\theta$ method with variable scanning rate of 6-24 deg/min). Analysis of the systematic extinctions hkl indicated the space group P4₃n, characteristic of sodalite, and in this the authors interpreted the structure. (10 refs.)

61891 The crystal structure of α -NaTm(SO₄)₂. S.M. Chizhov, A.N. Pokrovskii, L.M. Kovba (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Crystallogr. (USA), vol. 27, no. 5, p. 598-9 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol. 27, no. 5, p. 997-8 (Sept.-Oct. 1982). [received: April 1983]

By slow cooling of a melt containing 70 mole % Na₂SO₄ and 30 mole % Tm₂(SO₄)₃ from 880°C, the authors have obtained single crystals of the high-temperature modification of the double sulfate of sodium and thulium of the composition 1:1. An investigation of the crystal in a Hilger Y-290 diffractometer (Mo K α radiation, $\theta/2\theta$ scanning) revealed that the double sulfate is monoclinic (with space group P2₁/m, unit-cell parameters $a = 4.669(3)$, $b = 10.143(7)$, $c = 6.837(4)$ Å, $\gamma = 110.40(3)^\circ$, $Z = 2$, and isostructural with the double sulfate NaEr(SO₄)₂). Using the atomic coordinates for thulium and sulfur found from an analysis of the distribution of the interatomic Patterson function, the authors calculated a series of $\rho(x, y, z)$ syntheses which enabled us to determine the positions of all the atoms. Least-squares refinement led to a discrepancy index of 0.060. The coordinates of the basis atoms of the structure of the high-temperature double sulfate of sodium and thulium and the principal interatomic distances are listed. (1 ref.)

61892 Crystal chemistry of series of inhomogeneous linear structures. III. The crystal structures of Ce₂Ga₁₀Ni and La₂Ga₁₀Ni. Ya.P. Yarmolyuk, Yu.N. Grin', I.V. Rozhdvestvenskaya, O.A. Usov, A.M. Kuz'min, V.A. Bruskov, E.I. Gladyshevskii (State Univ., L'viv, Ukrainian SSR).

Sov. Phys.-Crystallogr. (USA), vol. 27, no. 5, p. 599-600 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol. 27, no. 5, p. 999-1001 (Sept.-Oct. 1982). [received: April 1983]

Investigates the crystal structures and structural relations of the compounds R₂Ga₁₀Ni (R = La, Ce), found in a study of the phase diagrams of the corresponding triple systems of rare-earth and transition metals with gallium, and belonging to the series of inhomogeneous linear structures. Laue photographs revealed tetragonal symmetry (4/mmm), and measurements of the unit-cell periods by means of rotation photographs (Cu K α) and in a Syntex P2₁ automatic diffractometer (Mo K α), gave the values $a = 4.262(3)$ Å, $c = 26.391(9)$ Å. As the array contained only reflections with $h+k+l=2n$, the possible space groups were 14/mmm, 14mm, 14m2, 142m, and 1422. A statistical test favored a centrosymmetric group. (4 refs.)

61893 Neutron diffraction study of the thermal and oxygen position parameters in rutile. W. Gonschorek (Dept. de Fisica, Univ. Coimbra, Coimbra, Portugal), R. Feld.

Z. Kristallogr. (Germany), vol. 161, no. 1-2, p. 1-5 (1982). Integrated neutron intensities for rutile (TiO₂) were measured up to $\sin \theta/\lambda = 0.94$ Å⁻¹ with two crystals of volumes 1.2 mm³ and 8.9×10^{-3} mm³. A statistical treatment showed the data not to be normally distributed. From the statistics of the symmetry-equivalent intensities there was no evidence of anisotropic extinction. Isotropic extinction parameters were refined for both crystals. There is no significant difference between the neutron and X-ray refined structure parameters. The thermal motion of titanium is larger than that of oxygen. (8 refs.)

61894 The crystal structures of α - and β -forms of plutonium(IV) sulphate tetrahydrate. N.C. Jayadevan, K.D. Singh Mudher, D.M. Chackraburty (Radiochem. Div., Bhabha Atomic Res. Centre, Bombay, India).

Z. Kristallogr. (Germany), vol. 161, no. 1-2, p. 7-13 (1982). Pu(SO₄)₂·4H₂O has been prepared in two polymorphic forms α - and β -.

The α -form crystals are orthorhombic, space group Fddd, with eight formula units in a cell of dimensions $a = 26.527(19)$, $b = 11.995(9)$ and $c = 5.687(4)$ Å. The β -form crystals are also orthorhombic, space group Pnma with four formula units in a cell of dimensions $a = 14.544(10)$, $b = 10.980(8)$ and $c = 5.667(3)$ Å. The structure of the β -form has been determined from three dimensional X-ray data obtained on Weissenberg films. A least-squares refinement has led to a value of the conventional R index of 0.089 for 476 observed reflections. The coordination geometry about the Pu(IV) ion is an archimedean square—an antiprism formed by oxygen atoms from four sulphate groups and four water molecules. Each sulphate group is shared by two Pu(IV) ions. Hydrogen bonds operate between the water molecules and sulphate oxygen atoms not bonded to plutonium. The structure of the α -form derived from powder data shows that it differs from the β -structure only in the functional nature of the hydrogen bonds. The α - to β -transformation can be achieved by slow heating up to 120°C. (8 refs.)

61895 Crystal morphology of monoclinic potassium feldspars. A qualitative approach with special emphasis on the periodic bond chain theory of Hartman and Perdok. C.F.Woensdrecht (Inst. voor Aardwetenschappen Utrecht, Utrecht, Netherlands).

Z. Kristallogr. (Germany), vol.161, no.1-2, p.15-33 (1982).

The influence of the crystal structure on the crystal morphology of monoclinic potassium feldspar has been investigated according to the theory of Hartman and Perdok (1955). There are a limited number of PBCs, i.e. uninterrupted chains of strong bonds, consisting exclusively of T(=Si,Al)-O bonds. These are parallel to $[001]$, $\langle 1/2/2 \rangle$, $[101]$, $[100]$, $\langle 1/2/2 \rangle$, $[010]$ and $[102]$. Many other PBCs are present having both T-O and K-O bonds as strong bonds, e.g. $\langle 1/2/2 \rangle$, $\langle 3/2/2 \rangle$, $[101]$, $\langle 1/2/2 \rangle$, $\langle 1/2/2 \rangle$, $[201]$ and $[111]$. The most important crystal faces can be classified as either F_1 faces parallel to at least two PBCs having only T-O, or as F_2 faces parallel to at least two PBCs, one of which contains in addition K-O bonds. The F_1 faces are $\{110\}$, $\{001\}$, $\{101\}$, $\{201\}$ and $\{111\}$. The F_2 faces are $\{130\}$, $\{021\}$, $\{221\}$, $\{112\}$, $\{100\}$ and $\{101\}$. The remaining faces parallel to the various PBCs are S faces. Crystals grown in nature display only F faces as the most important faces. The presence of S faces is induced by internal factors other than crystal structure or by external factors such as impurities and supersaturation. (25 refs.)

61896 Morphology and crystal growth of structurally related A_2BX_4 - and A_2BX_5 -compounds. H.Folner, H.Schwarz (Mineralogisch-Kristallographisches Inst., Tech. Univ. Clausthal, Clausthal-Zellerfeld, Germany).

Z. Kristallogr. (Germany), vol.161, no.1-2, p.35-43 (1982).

The morphological relationship of compounds of glaserite, Na_2SO_4 , low K_2SO_4 and olivine types is examined. The crystal structures can be retraced to a common basic structure. The morphological lattice is determined by a sign determination with the help of the Goldschmidt complication rule and with Fourier methods. The crystal growth of olivine, having a morphology similar to that of barite, deviates from the other compounds. The differences are indicated with the help of partitions of the three-dimensional space into Dirichlet domains of morphological points. The packing of space-filling polyhedra allow conclusions to be drawn on the growth mechanisms. (25 refs.)

61897 The crystal structure of $NaCrP_2O_7$. L.Bohaty, J.Liebertz (Inst. für Kristallographie, Univ. zu Köln, Köln, Germany), R.Frohlich.

Z. Kristallogr. (Germany), vol.161, no.1-2, p.53-9 (1982). In German.

The crystal structure of $NaCrP_2O_7$ has been determined by X-ray diffraction. The crystal data are: space group $P2_1/c$, $a=7.294(2)$, $b=7.838(2)$, $c=9.484(2)$ Å, $\beta=111.72(2)^\circ$, $V=503.8(4)$ Å³, $D_m=3.26$, $D_c=3.282$ Mg m⁻³, $Z=4$, $\mu(MoK\alpha)=2.89$ mm⁻¹. The structure was refined to $R=0.029$ for 2381 independent reflections ($|F_o| \geq 4\sigma(F_o)$). In addition, the lattice parameters of compounds isostructural with $NaCrP_2O_7$ were measured. (5 refs.)

61898 The crystal structure of antimony seleniodide, $SbSeI$. G.P.Voutsas, P.J.Rentzperis (Appl. Phys. Lab., Aristotle Univ. of Thessaloniki, Thessaloniki, Greece).

Z. Kristallogr. (Germany), vol.161, no.1-2, p.111-18 (1982).

The crystal structure of $SbSeI$ has been determined with the intensities of 821 independent reflections, measured on a computer-controlled Philips PW 1100 single-crystal diffractometer. The cell constants obtained by least-squares calculations from direct θ -value measurements on the diffractometer, are: $a=8.6862(9)$, $b=10.3927(9)$, $c=4.4152(3)$ Å, $Z=4$; space group $Pnam$. The positional and thermal parameters, with anisotropic temperature factors, were refined by full-matrix, least-squares calculations to a final $R=0.054$. (14 refs.)

61.65 SPECIFIC STRUCTURE OF ORGANIC COMPOUNDS

61899 Crystal and molecular structure of tetrachlorophosphorus (V) hexachlorouranate (V). J.C.Taylor, A.B.Waugh (Div. of Energy Chem., Lucas Heights Res. Labs., CSIRO, Sutherland, NSW, Australia).

Polyhedron (GB), vol.2, no.3, p.211-16 (1983).

The crystal structure of tetrachlorophosphorus (V) hexachlorouranate (V), $PCl_4^+UCl_6^-$, has been solved with 2492 independent F(hkl) collected by necessity from one component of a bocrystal: all crystals prepared were twinned. The structure is triclinic, space group $P1$, with $a=7.038(4)$, $b=7.373(4)$, $c=13.706(8)$ Å, $\alpha=89.38(3)^\circ$, $\beta=88.80(3)^\circ$, $\gamma=105.20(3)^\circ$, with $Z=2$. The two components of the bocrystal, in the volume ratio of 2.5 to 1, had their reciprocal lattice spots sufficiently separated to allow collection of the data set from component 1 with $AgK\alpha$ radiation ($\lambda=0.5608$ Å). A model was derived from the Patterson synthesis and refined by least squares to $R=\Sigma(|F_o|-|F_c|)/\Sigma|F_o|=0.146$. The structure was confirmed by a final ($\rho_r-\rho_c$) synthesis. The structure is an assembly of octahedral $U(1)Cl_6^-$, $U(2)Cl_6^-$ and tetrahedral PCl_4^+ groups. The chlorine atom array is hexagonal close-packed, while the polyhedra are regular within the experimental errors. The structure is isomorphous with the transition metal analogues PCl_5NbCl_5 and PCl_5TaCl_5 . (15 refs.)

61900 Crystal data for bis(η^5 -tert-butylcyclopentadienyl)hafnium(IV) dihydride dimer, $[(\eta^5-t-BuC_5H_7)_2HfH(\mu-H)]_2$. A.Laarif, F.Theobald (Faculte des Sci., Univ. de Besancon, Besancon, France); B.Gauthier, G.Tainturier.

J. Appl. Crystallogr. (Denmark), vol.16, pt.2, p.277 (1 April 1983).

Summary form only given, as follows. The air-sensitive title hydride $[(Hf(C_5H_7)_2)_2H_2]$ was prepared by hydrogenolysis of $(t-BuCp)_2HfMe_2$ (Conturier, 1980) and crystallized from a solution in heptane or toluene and hexane. The compound is triclinic with the following cell parameters: $a=7.22(3)$, $b=10.31(4)$, $c=12.47(6)$ Å, $\alpha=80.4(4)^\circ$, $\beta=74.6(4)^\circ$, $\gamma=72.1(3)^\circ$, $V=847$ Å³, $Z=1$, $D_x=1.67$ Mg m⁻³. Powder diffraction data were obtained from Debye-Scherrer photographs. The extended version of the paper examines several examples where Zr or Hf hydrides are monomers or dimers and shows that this structure is very similar to the related $[(MeCp)_2ZrH_2]$ compound (Jones & Petersen, 1981). This similarity and spectroscopic data show that the molecule probably has a center of symmetry situated between the two Hf atoms and the two bridging H atoms. The JCPDS Diffraction File No. for $[Hf(C_5H_7)_2)_2H_2]$ is 33-1996.

61901 Molecular and crystal structures of pregna-4, 16-dien-21-ol-3,20-dione acetate (16-dehydrocortexone) and pregna-1,4-dien-17 α ,21-diol-3,20-dione 21-acetate (dehydrocortexolone acetate). Z.I.Khazheeva, V.I.Simonov, A.V.Kamernitskii, N.S.Pavlova-Grishina, A.V.Skorova (Inst. of Crystallography, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.543-6 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.905-10 (Sept.-Oct. 1982). [received: April 1983]

Using diffractometric data and direct methods, the authors have determined and refined the structures of two steroid compounds: $C_{27}H_{30}O_4$ ($a=7.400$ Å, $b=12.926$ Å, $c=21.316$ Å, space group $P2_12_12_1$, $R=5.1\%$) and $C_{27}H_{30}O_5$ ($a=7.550$ Å, $b=11.805$ Å, $c=23.454$ Å, space group $P2_12_12_1$, $R=3.8\%$). The conformational parameters of the molecules of these biologically active compounds are established and analyzed. (7 refs.)

61902 Crystal structure of the π complex of cuprous chloride with acrylic acid. P.Yu.Zavaliy, V.S.Fundamenskii, M.G.Mys'kiv, E.I.Gladyshevskii (State Univ., L'vov, Ukrainian SSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.547-9 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.911-15 (Sept.-Oct. 1982). [received: April 1983]

The authors make a complete X-ray structure analysis of the π complex of CuCl with acrylic acid, with the composition $CuCl.C_3H_5O_2$. The parameters of the orthorhombic unit cell are $a=8.153(2)$ Å, $b=6.2234(8)$ Å, $c=20.620(3)$ Å, space group $Pbca$, $Z=8$ (automatic diffractometer, Mo $K\alpha$ radiation, Patterson and Fourier syntheses, parameters of all atoms refined to $R=0.048$). The copper and chlorine atoms form layers of six-membered rings with the boat conformation. The Cu-Cl distances are 2.245, 2.256, and 3.104 Å. The acrylic acid molecules are bound into dimers by hydrogen bonds O-H...O 2.644 Å long. These centrosymmetric dimer molecules link the CuCl layers, coordinating the copper atoms from different layers by C=O bonds. The Cu...C distances are 2.040 and 2.043 Å. The length of the C=C bond in the acrylic acid in the complex is increased to 1.377 Å as against 1.30 Å in the free state. (4 refs.)

61903 Crystal and molecular structures of two 15-membered crown ether triones: 1,4,7,10,13-pentaaxycyclopentadecane-3,11,15-trione and 4,7,10,13-tetraoxa-1-thiacyclopentadecane-3,11,15-trione. Yu.G.Ganin, Yu.A.Simonov, N.G.Luk'yanenko, Yu.A.Popkov, A.V.Bogatskii (Inst. of Appl. Phys., Acad. of Sci., Moldavian SSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.550-3 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.916-22 (Sept.-Oct. 1982). [received: April 1983]

The crystal structures of the compounds 1,4,7,10,13-pentaaxycyclopentadecane-3,11,15-trione (I) and 4,7,10,13-tetraoxa-1-thiacyclopentadecane-3,11,15-trione (II) are determined. The two 15-membered rings differ in the nature of the heteroatoms (O and S) in the first position. The conformations of the polyethylene and oxyacid parts are discussed. The authors advance the hypothesis that there is $\pi(p-d)$ interaction between the sulfur atom and the adjacent ether oxygens in II. Nonvalence 1,4-interactions, capable of stabilizing the conformations of the macrocyclic rings, are noted. (21 refs.)

61904 A new refinement of monoclinic tetracyanoethylene (TCNE) from X-ray and neutron data. U.Druck, H.Guth (Philipps-Univ., Marburg, Germany).

Z. Kristallogr. (Germany), vol.161, no.1-2, p.103-10 (1982).

The monoclinic phase of TCNE (C_6N_4) was submitted to a new X-ray and neutron diffraction analysis. Contrary to the results reported by Bekoe and Trueblood (1960) the authors found a slight disorder, such that 3.8-5% of the molecules are rotated about 90 degrees in the molecular plane around their center of gravity. The final R -values are 0.035 for the X-ray- and 0.033 for the neutron-data. The resulting X-N-map showed clearly resolved peaks, the heights of which correspond well with theoretical calculations. 61.70 DEFECTS IN CRYSTALS

(see also 61.80 Radiation damage, 62. Mechanical and acoustic properties, 71.55 Impurity and defect levels, 76.30M EPR of colour centres and other defects, 78.50 Impurity and defect absorption in solids, 81.40 Treatment of materials)

61905 Observation of a new memory effect in a modulated structure. J.P.Jamet, P.Lederer (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).

J. Phys. Lett. (France), vol.44, no.7, p.L257-64 (1 April 1983).

The authors report the first observation of a new memory effect in a modulated structure (deuterated thiourea). They present a qualitative explanation of this effect in terms of mobile defects, or impurities interacting with the modulation order parameter. The authors show that this effect can be used to obtain the lines of constant modulation wavevector in the E , T plane of the phase diagram, by thermodynamic methods. They suggest that a similar periodic modulation of defect concentration occurs in CDW systems like $NbSe_3$, and accounts for the non linearity induced by the electric field. (20 refs.)

61906 Oxygen defect profile in implanted garnet. P.Gerard, P.Martin, R.Danielou (LETI, CEA, Grenoble, France).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.303-6 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

For the first time direct measurements are presented for an oxygen defect profile, produced through implantation, in a bubble garnet material. An analysis of oxygen defects and of damage on heavy atoms profiles is given as a function of depth for the neon implantation at a dose of $2 \times 10^{14} \text{ cm}^{-2}$ by channeling experiments with nuclear reactions (NR) and Rutherford back-scattering (RBS). A good correlation is found between the present and the previous profiles obtained by using other experimental methods. (11 refs.)

61907 Comparison of different approaches to the study of local defects in crystals. I. Theoretical considerations and computational schemes. C.Pisani, R.Dovesi, P.Ugliengo (Inst. of Theoretical Chem., Univ. of Turin, Turin, Italy).

Phys. Status Solidi b (Germany), vol.116, no.1, p.249-59 (1 March 1983).

The standard way of treating local defects in crystals is to correct the Green function of the perfect periodic host system so as to account for the defect. This approach, which is termed here as 'perturbed crystal', is compared with a 'perturbed cluster' approach where instead the molecular solution for a cluster of atoms around and including the defect is corrected in order to account for the presence of the infinite surrounding medium. It is first shown that when a unique basis set is used to describe the crystal both before and after the defect is created, the perturbed crystal approach is essentially simpler. When however the defect is complicated and the use of different basis sets is practically compulsory, then the other approach is more natural and the corresponding computational scheme is more easily implementable. New explicit formulae for the perturbed cluster approach are derived which are more powerful and general than those used in previous works. (18 refs.)

61908 The mechanisms of the formation and growth of water bubbles and associated dislocation loops in synthetic quartz. A.C.McLaren, R.F.Cook, S.T.Hyde, R.C.Tobin (Dept. of Phys., Monash Univ., Clayton, Victoria, Australia).

Phys. & Chem. Miner. (Germany), vol.9, no.2, p.79-94 (1983).

The development of water bubbles in synthetic quartz has been monitored by measurements of (i) the intensity of the light scattered and (ii) the increase in volume of the crystal, both as a function of temperature and time. These macroscopic measurements have been complemented by observations of the resulting microstructures, using transmission electron microscopy (TEM). A mechanism is proposed on the assumption that hydrogen is incorporated in the quartz structure by means of $(4 \text{ H})_{\text{Si}}$ defects. On heating, these defects diffuse and clusters develop. A cluster of $n(4 \text{ H})_{\text{Si}}$ produces a water bubble of $(n-1)\text{H}_2\text{O}$, without any change of volume of the crystal. At any temperature T there is a critical bubble diameter above which the 'steam' pressure P exceeds the pressure p for a spherical bubble in mechanical equilibrium. If P becomes greater than p , then the bubble increases in volume until $P=p$, the increase in volume being achieved by the pipe diffusion, of Si and O away from the bubble site into a linked edge dislocation loop. This process produces the observed increase in volume of the crystal. The two diffusion processes take place virtually simultaneously and continue until all the $(4 \text{ H})_{\text{Si}}$ defects have been trapped in the bubbles. Values of the diffusion constant and the activation energy for the diffusion of the $(4 \text{ H})_{\text{Si}}$ defects are deduced. The relevance of these observations to the hydrolytic weakening of quartz is briefly discussed. (28 refs.)

61909 Effect of external stress on formation of vacancy loops in quenched aluminum. A.Sato, Y.Sugisaki, T.Mori (Dept. of Materials Sci. & Engng., Tokyo Inst. of Technol., Yokohama, Japan).

Acta Metall. (USA), vol.31, no.5, p.805-11 (May 1983).

Effects of tensile and compressive stresses on formation of vacancy loops in quenched 99.99% aluminum have been examined by using single crystals with the $\{110\}$ stress axis. Compressive stress acting on a $\{111\}$ plane promotes formation of faulted loops from vacancy clusters on this plane. Correspondingly, tensile stress retards formation of faulted loops on a $\{111\}$ plane, on which the stress acts. Based on a classical nucleation theory, a critical size for a vacancy disc to collapse into a faulted loop is estimated to be $\sim 3.0b$ in radius, containing ~ 37 lattice points on the fault plane, from the stress dependence of the nucleation rate of the loops. (17 refs.)

61910 An ephemeral Frenkel pair in iridium. M.-H.Gely, A.Dunlop, Y.Querre (CEN, Fontenay-aux-Rose, France).

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.1, p.23-8 (10 Jan. 1983). In French.

After activation by a neutron flux, iridium samples have been kept at low temperature (22K). The electrical resistivity decreases or increases according to whether the activation was moderate or high. A coherent interpretation is given implying the recoil-induced creation of a Frenkel pair during activation and its subsequent annihilation, with a probability ≈ 8 due to a second sub-threshold recoil. (11 refs.)

61911 Influence of ultrasound on the concentration of point defects in KBr crystals. Yu.A.Ivashkin, N.A.Tyapunina (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.604-5 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1007-9 (Sept.-Oct. 1982). [received: April 1983]

The authors have studied the process of PD formation in KBr crystals deformed by ultrasound. Point defects are formed in the process of plastic deformation as a result of the motion and interaction of dislocations. It had earlier been established that the excess PD concentration depends on the degree of plastic deformation and the stress in static conditions of loading. Two methods were used—flotation, based on precision measurements of the density of the specimens, and the method of control coloration. The flotation method gives an upper estimate of the change in vacancy concentration, since the change in density of the specimens is due not only to single vacancies but also to complexes of PD, pores, and microcracks. The control coloration method gives a lower estimate of the change in PD concentration, since it reflects only the change in concentration of F centers and their constituent anion vacancies. The functional dependences of the excess vacancy concentration on the stress, found by the two methods, are similar. It was of interest to use the control coloration method to investigate the concentration of anionic vacancies in crystals deformed by ultrasound. (20 refs.)

61912 A model for the evolution of a twist dislocation network. F.A.McClintock, F.Prinz (Dept. of Mech. Engng., MIT, Cambridge, MA, USA).

Acta Metall. (USA), vol.31, no.5, p.827-32 (May 1983).

The transition from edge dislocation loops to a hexagonal grid of screw dislocations is followed for torsion of a single f.c.c. crystal with a $\{111\}$ cross section and $\{112\}$ faces, so that $\{110\}$ slip directions are parallel to the surface and in the plane of the cross section. Application of the results to stress-strain behavior, as well as computer modeling of the reactions, appears tractable. (12 refs.)

61913 Velocity of a finite dislocation. A.S.Mel'nichenko (Inst. of Steel & Alloys, Moscow, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.390-1 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. It is known that the velocity of a dislocation depends on its length if this length is less than a certain critical value. Calculations are compared with the experimental data for niobium and it is found that at 77K the critical length is considerably greater than the dimensions of moving dislocation segments. This conflict between the theory and experiment may be due to small amounts of impurities, which can reduce considerably the velocity of a kink without altering significantly the rate of formation of kinks. Another possibility is the presence, on moving dislocations, of steps separated by an average distance less than the critical value at 77K. (6 refs.) *A.T.*

61914 Structure of dislocation cores in the silicon crystal. S.L.Altmann (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England), A.Lapicicella, K.W.Lodge.

Int. J. Quantum Chem. (USA), vol.23, no.3, p.1057-63 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

The authors have recently produced a Lifson-Warshel force field for the silicon crystal. This field, that goes further than the harmonic approximation, is particularly adapted for the calculation of defect structures. It requires five free parameters, but one of them in the field already produced, the linear bending term, is significant for the perfect lattice structure only and should be eliminated in dealing with defect structures. Also, one of the fixed parameters can be adjusted to fit precisely the experimental value of the stacking fault energy. They show that an excellent fitting of the phonon dispersion curves, in the least squares sense, is obtained with the parameters thus changed. They illustrate the use of this field in discussing the problem of reconstruction of the 90° partial dislocation in silicon. (18 refs.)

61915 Core energies and core tensions of dissociated and partial dislocations in FCC and HCP metals. F.Prinz (Dept. of Mech. Engng., Carnegie-Mellon Univ., Pittsburgh, PA, USA), A.Korner, H.O.K.Kirchner. *Philos. Mag. A (GB)*, vol.47, no.3, p.441-52 (March 1983).

Using the anisotropic theory of elasticity and a semi-atomistic Peierls model, the core energies and core tensions of dislocations in FCC and HCP metals have been calculated. All the results were expressed in terms of Fourier expansions. A simple algorithm allowed the determination of the core energies and core tensions of individual Shockley partials which form the perfect dislocations in close-packed planes. (26 refs.)

61916 Dislocation clusters in elastic fields. V.I.Vladimirov, N.D.Priemskii (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1056-8 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1721-4 (Sept. 1982). [received: April 1983]

Results are reported from calculations of the parameters of dislocation clusters produced in elastic fields. A number of different approximate descriptions are used for the dislocations (continuum and several discrete models). It is shown that the distribution function for the dislocations in a cluster is very sensitive to the nature of the interactions among dislocations at small distances. Numerical calculations are used to demonstrate that the continuum approximation of dislocation clusters, previously suggested by the authors and is designed to find approximate solutions of kinetic and other nonlinear problems by discarding nonphysical terms from the cluster equilibrium equation, gives better results than the singular integral equation approach, which is best suited for problems admitting a solution in closed form. Frictional effects on the nature of the solution are investigated. (5 refs.)

61917 Etching characterization of {001} semi-insulating GaAs wafers. Y.Okada (Electrotech. Lab., Ibaraki, Japan).

Jpn. J. Appl. Phys. Part I (Japan), vol.22, no.3, p.413-17 (March 1983). The characteristics of {001} semi-insulating GaAs wafers have been investigated by the etching/optical microscopy. New etch features such as groove have been revealed in only LEC crystals together with ridge features by an AB etch, but not in boat-grown crystals. The groove features are specifically revealed on gathering and twisting dislocations such as cell or lineage structures, and coincide with each dislocation lying near the surface. Small pits along the ridge features have been revealed in undoped LEC crystal, but not in undoped boat grown crystals. The distribution of the ridge features with the small pits correlates with that of 0.8 eV photoluminescence intensity in the wafer. (12 refs.)

61918 Dissolution kinetics and etch pit studies of potassium aluminium sulphate. B.van der Hoek, W.J.P.van Enckevort, W.H.van der Linden (RIM Lab. of Solid State Chem., Catholic Univ., Nijmegen, Netherlands).

J. Cryst. Growth (Netherlands), vol.61, no.2, p.181-93 (March 1983). The dissolution process of the {111} faces of potash alum is studied, both by microtopographic examinations of the etch pit patterns and by measurement of the dissolution kinetics in a rotating disc crystallizer. Both methods showed that the Cabrera-Levine dissolution theory holds for the two most common dislocation types ending on the {111} faces of potash alum. On the basis of the rotating disc experiments, the interfacial supersaturation of the etch pit experiments was roughly estimated. Using this, it was found that at interfacial supersaturations below -0.6% (dislocations with (110) Burgers vector) or below -0.85% (dislocations with (100) Burgers vector) numerous etch pits related to those dislocation types appeared. Below those undersaturations the dissolution process is mainly determined by volume diffusion. From the critical undersaturation, determined in the rotating disc crystallizer, the value of

the edge free energy of a step was found to be approximately 0.01 J/m². (31 refs.)

61919 Etch pits on single crystals and bicrystals of niobium. B.C.Cai, A.Dasgupta, Y.T.Chou (Dept. of Metall. & Materials Engng., Lehigh Univ., Bethlehem, PA, USA).

J. Less-Common Met. (Switzerland), vol.90, no.1, p.37-45 (March 1983). Three types of etch pit were observed on single crystals and bicrystals of niobium. The relationship between the shape of the pits and the orientation of the etching surface was established and discussed on the basis of the surface energy concept. It was demonstrated that misorientations of tilt boundaries can be determined in bicrystals using the etch pit technique. (9 refs.)

61920 Improved technique for observation of dislocation structure of austenitic MnCrNi steels after small deformation. A.Gemperle (Inst. of Phys., Czechoslovak Acad. of Sci., Praha, Czechoslovakia), I.Kasova, V.Cihal. *J. Microsc. & Spectrosc. Electron. (France)*, vol.7, no.6, p.559-74 (Dec. 1982).

Up to now, dislocation structures have been compared in statistically oriented grains in most papers dealing with plastic deformation of polycrystals. In these grains slip is accomplished on various slip systems with various intensities and only very distinct differences in dislocation arrangement in relation to e.p. stacking fault energy can be detected. In this paper an attempt is made to equalize the deformation conditions for the comparison of dislocation structures by a choice of grains having equal crystallographic orientation in respect to tensile axis. (6 refs.)

61921 Weak beam images of dislocations triple ribbons. G.Vanderschaeve (Univ. des Sci. et Tech. de Lille, Villeneuve d'Ascq, France). *J. Microsc. & Spectrosc. Electron. (France)*, vol.7, no.6, p.695-14 (Dec. 1982). In French.

Weak beam images of dislocations triple ribbons have been calculated, taking into account the overlap of the strain field due to each partial dislocation. It is shown that the separation of image peaks is very close to the actual separation between dislocations providing $|s|d > |g.b|$ for screw dislocations and $|s|e \geq 17|g.b|$ for edge dislocations, where d is the width of the narrower stacking fault ribbon. (18 refs.)

61922 Dissociation of dislocations in diamond. P.Pirouz, D.J.H.Cockayne (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England), N.Sumida, P.Hirsch, A.R.Lang.

Proc. R. Soc. London Ser. A (GB), vol.386, no.1791, p.241-9 (8 April 1983).

Weak-beam electron microscopy has been applied to study the dissociation of dislocations in a type IIa diamond. Dislocations with Burgers vector $\frac{1}{2}[110]$ on (111) glide planes have been found to be dissociated into two Shockley partials, with separations between 2.5 and 4.3 nm, and extended nodes and dissociated dipoles have also been observed. The stacking fault energy has been determined, from the mean and distribution of the separations of the partials, to be 279 ± 41 mJ m⁻². The behaviour of dislocations in diamond appears to be similar to that of dislocations in Ge and Si. (36 refs.)

61923 Glide dislocations on cube planes in a low stacking-fault energy alloy. A.Korner, H.P.Karntaler (Inst. fur Festkörperphys., Univ. Wien, Wien, Austria).

Phys. Status Solidi a (Germany), vol.75, no.2, p.525-35 (16 Feb. 1983).

Single crystals of Cu-15 at.% Al strained into stage II are studied using electron microscopy methods. In spite of the very low stacking-fault energy total dislocations $\{a/2 [110] (001)\}$ are observed to bow out on the cube plane under the influence of the internal stresses. These dislocations can originate from the transformation of Lomer-Cottrell locks which can glide on (001) after being constructed. The shape of the half loops observed on (001) deviates strongly from the elliptical one and agrees well with the calculated shapes using anisotropic elasticity theory. From the curvature of the loops large stresses are deduced which are interpreted in terms of a dislocation locking stress caused by short-range-order effects pinning the dislocations. (25 refs.)

61924 Chemical etching of deformation sub-structures in quartz. M.W.Wegner, J.M.Christie (Dept. of Earth & Space Sci., Univ. of California, Los Angeles, CA, USA).

Phys. & Chem. Miner. (Germany), vol.9, no.2, p.67-78 (1983).

Chemical etching of dislocations has been studied in natural and synthetic quartz single crystals, is deformed synthetic quartz and in naturally and experimentally deformed quartzites. The ability of different etchants to produce polished or preferentially etched surfaces on quartz is described. Dislocation etching was achieved on all crystal planes examined by using a saturated solution of ammonium bifluoride as the etchant. Appropriate etching times were determined for etching quartzites for grain size, sub-grain boundaries, deformation lamellae, dislocations and twins. Growth and polished surfaces of synthetic single crystal quartz were similarly etched and dislocation etch pits, characteristic of various orientations were found. The use of ammonium bifluoride proved to be especially advantageous for the basal plane, producing a polished surface with etch pits, suitable for dislocation etch pit counting. 'Double' etch pits, have been found on Dauphine twin boundaries on the basal plane and the first order prism, using this etchant. Slip lines and deformation bands were suitably etched on deformed synthetic crystal surfaces for identification of the slip planes. Other acidic etchants have been explored and their application to the study of deformation structures in quartz crystals is discussed. (57 refs.)

61925 Effect of interaction of misfit dislocations in multilayer epitaxial films. A.I.Fedorenko, B.A.Savitskii, A.Yu.Sipatov, L.P.Shpakovskaya (Polytech. Inst., Khar'kov, Ukrainian SSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.569-74 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.948-55 (Sept.-Oct. 1982). [received: April 1983]

Electron microscopy and electron diffraction are used to investigate the dislocation structures of three-layer epitaxial films, taking the chalcogenides of lead as an example. Systems of types *ABA* and *ABC* are considered, and are grown by successive deposition of chalcogenides *A*, *B*, and *C* (PbS, PbSe, PbTe). In both types of film, the preceding interphase surface is found to have a marked influence on the formation of a dislocation structure at the next interphase boundary. This is because of two effects: (i) interactions between the fields of elastic stresses of misfit dislocations at adjacent boundaries; (ii) inheritance of vertical 'tails' of misfit dislocations from the preceding interphase surface by the following epitaxial layer. (8 refs.)

61926 Observation of precipitates on 'growth' dislocations in GaAs single crystals with low impurity content. A.V.Markov, S.S.Shifrin, L.M.Morgulis (State Sci.-Res. & Design Inst. of Rare Metals Industry, USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.620-2 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1031-3 (Sept.-Oct. 1982). [received: April 1983]

The authors have studied 'growth' dislocations in GaAs single crystals grown by the Czochralski method and also by horizontal directed crystallization, and doped with various impurities (Te, S, Sn, Si, Zn, Cr) over a wide range of

concentrations. The impurity concentrations were determined by means of electrophysical measurements; in the case of Cr-doped seminsulating GaAs, they were determined by means of chemiospectral analysis. The dislocations were revealed by means of Abrahams-Buiochi etching agent (AB), which gives high relief of the traces in the 'projection' etching pattern. After thinning in a polishing etchant of $H_2SO_4:H_2O_2:H_2O=3:1:1$ to about 40-50 μ , the specimens were finished off in AB etchant and dislocation traces led to a thin place which was transparent to electrons at an accelerating voltage of 100 kV. 61927 The role of elastic interaction stresses on the onset of slip in polycrystalline alpha brass. I. Experimental determination of operating slip systems and qualitative analysis. K.Hashimoto, H.Margolin (Dept. of Phys. & Engng. Metall., Polytech. Inst. of New York, New York, NY, USA). *Acta Metall. (USA)*, vol.31, no.5, p.773-85 (May 1983).

Coarse grained α -brass specimens with grain sizes of 2.4 mm (as cast), 0.86 (wrought), 0.52 (as cast) and 0.19 (wrought) were compressed to the proportional limit. The orientation of a number of grains, including 67 which revealed cross slip, were determined by the back reflection Laue technique. Trace analysis of cross slipping systems permitted the determination of the operating slip systems. Of the 195 slip systems determined, 118 were primary or strongly operating. The remainder were either cross slip or secondary slip systems. Of the 118 primary slip systems only 30 had the highest Schmid Factor (S.F.) based on the applied stress. This indicated that internal stresses arising from the elastic interactions of neighboring grains, provided the necessary additional stress to permit the observed slip system to operate. A qualitative analysis, based on the elastic contribution of surrounding grains to slip in a given grain confirmed this inference. (16 refs.)

61928 Strains and internal stresses in silicon wafers. A.P.Oksanich. *Ind. Lab. (USA)*, vol.48, no.6, p.587-91 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.52-5 (June 1982). [received: March 1983]

A study is made of complicated kinds of deformations in silicon wafers, and diagrams of macrostresses and dislocations in them are determined. A procedure and equipment are developed for checking complicated kinds of bends in which the degree of distortion is accounted for automatically as a function of crystallographic directions. (11 refs.)

61929 Comments on reported magneto-oscillations in dislocation drag at low temperatures. B.R.Watts (School of Math. & Phys., Univ. of East Anglia, Norwich, England). *Philos. Mag. B (GB)*, vol.47, no.3, p.L25-8 (March 1983).

The essential similarity between recently reported oscillations in the magnetic field dependence of dislocation drag and quantum oscillations of conduction electrons is pointed out. An explanation, in terms of magnetostriction, for the appearance of quantum oscillations in the dislocation drag experiments is given. A consequence is that the oscillatory, and possibly the non-oscillatory, magnetic field dependence is not associated with dislocation drag. (8 refs.)

61930 The projected atomic structure of a large angle [001] $\Sigma=5$ ($\theta=36.9^\circ$) twist boundary in gold: diffraction analysis and theoretical predictions. J.Budai, P.D.Bristowe, S.L.Sass (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA).

Acta Metall. (USA), vol.31, no.5, p.699-712 (May 1983). The projected atomic structure of a large angle [001] $\Sigma=5$ ($\theta=36.9^\circ$) twist boundary in Au was determined using X-ray diffraction techniques. The extra reflections resulting from the periodic structure of the boundary were studied using synchrotron radiation. The observed structure factor rules are consistent with the boundary existing in the exact coincidence configuration. The projected structure was determined using a variable coordinate and reliability factor analysis which was simplified by the low value of Σ , the boundary symmetry and the assumption of a thin boundary region. The structure thus determined consists of groups of atoms which have undergone large rotations about '0'-elements in the planes immediately adjacent to the boundary. The structure is made up of separate patches of median f.c.c. structure in analogy with small angle boundaries. Various structures calculated by computer relaxation techniques using interatomic potentials are also presented and compared with the diffraction results. (34 refs.)

61931 Investigation of the structure of grain boundaries with special misorientations in tungsten. A.V.Volkov, L.K.Fionova (Inst. of Steel & Alloys, Moscow, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.402-5 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. A field-ion microscope was used to study the structure of grains with large values of the reciprocal of the density of common sites in the coincident-site lattice of tungsten of technical purity. It was found that a slight deviation of a tilt boundary from a plane of good matching resulted in the formation of microsteps, whereas the presence of a twist component was compensated by grain-boundary dislocations. (10 refs.) A.T.

61932 An investigation of the degree of randomness in the dispersion of point features (triple junctions) in a plane. S.R.Stock, J.E.Hilliard (Dept. of Materials Sci. & Engng., Northwestern Univ., Evanston, IL, USA).

J. Microsc. (GB), vol.130, pt.1, p.107-9 (April 1983).

The nearest-neighbour distance distribution was used as a criterion to investigate the dispersion of triple junctions. Comparison of the expected and measured distributions by the χ^2 -test indicated that the triple junctions were probably not randomly located, contrary to an earlier conclusion based on an areal probe of the same specimen. The present results suggest that areal probes are insensitive to large deviations from randomness in the location of points in a plane. (10 refs.)

61933 Determination of grain boundary rotation parameters from Kikuchi patterns. I. A simplified method for determining the accurate orientation relationship of two grains. H.O.Martikainen (Dept. of Mining & Metall., Helsinki Univ. of Technol., Espoo, Finland), M.A.Korhonen, V.K.Lindroos. *Phys. Status Solidi A (Germany)*, vol.75, no.2, p.559-66 (16 Feb. 1983).

A simplified method for analysing the crystallographic orientation relationship of two adjacent grains by using electron diffraction Kikuchi line patterns is described. The error estimates of rotation axis and angle determined by the method, are formulated. The present method appears to be particularly useful in fast and accurate orientation determinations. Furthermore, as the method of analysis is in a general form, it is not dependent on the crystal system in question. (14 refs.)

61934 Growth twins of biphenyl. O.G.Kozlova, E.D.Dukova, A.O.Orlova (Inst. of Crystallography, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.574-6 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.956-60 (Sept.-Oct. 1982). [received: April 1983]

The authors make goniometric measurements on macroscopic crystals of biphenyl and a twin of symmetry mm2. They find the conditions in which biphenyl forms twins when its crystals are grown from the vapor. Statistical data show that with $T=45^\circ\text{C}$ and $\Delta T=2-3^\circ$ composition of individual crystals into twins of symmetry mm2 occurs preferentially on the series of faces (101), (201), (301), belonging to the same crystallographic zone [010]. 61.70T Doping and implantation of impurities

- 61935 Kinetics of antimony doping in silicon molecular beam epitaxy. M.Tabe, K.Kajiyama (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.3, p.423-8 (March 1983).
 A new kinetic model for Sb doping into the Si MBE layer is proposed. In this model, Sb doping steps are assumed as follows: a fraction of impinging Sb₂ molecules adsorbs on the growing Si surface (adlayer) and monoatomic Sb desorbs from the adlayer into vapor; a fraction of monoatomic Sb in the adlayer is incorporated into the bulk, so that surface-concentration of Sb atoms may be in equilibrium with bulk-concentration of Sb. According to this model, calculated results successfully represent the present experimental data on relations between incident Sb₂ flux, Sb concentration in the adlayer and that in bulk. As a result, it is indicated that doping levels in MBE layers are uniquely determined by Sb concentration in the adlayer, and not by Sb₂ flux/Si flux ratio, when Si growth rate is lower than 1 Å/s.
 61936 A simple method to produce quasi-simultaneous multiple-energy helium implantation. F.Paszi, M.Fried, A.Manuaba, G.Mezei, E.Kotai, T.Lohner (Central Res. Inst. for Phys., Budapest, Hungary). *J. Nucl. Mater. (Netherlands)*, vol.114, no.2-3, p.330-3 (Feb. 1983).
 Demonstrates a simple and cheap method to produce a practically simultaneous multiple energy implantation where—in principle—no restrictions and limitations exist for obtaining different kinds of energy spectrum from a monoenergetic beam source. (11 refs.)
 61937 The post-hydrogenation of low-pressure chemical vapor deposited amorphous silicon. A.E.Widmer, R.Fehlmann, C.W.Magee (Lab. RCA Ltd., Zurich, Switzerland). *J. Non-Cryst. Solids (Netherlands)*, vol.54, no.3, p.199-205 (March 1983).
 Amorphous silicon films prepared by low pressure chemical vapor deposition were exposed to atomic hydrogen in an RF plasma. Concentrated hydrogen and 20% hydrogen in argon was used for the plasma. The hydrogen concentration as a function of depth was measured for various process parameters with secondary ion mass spectrometry (SIMS). Hydrogenation temperatures of 250 to 400°C and exposure times from 30-120 min were used. The hydrogen surface concentration varied between 4 and 10 at.%, whereby the higher values were obtained with plasma treatments in concentrated hydrogen. The fit of an error function diffusion profile to the experimentally measured SIMS concentration results in a diffusion coefficient at 400°C of $D=6 \times 10^{-14}$ cm² s⁻¹. (13 refs.)
 61938 High temperature and short time thermal annealing of ion-implanted silicon. S.Matsumoto, K.Kashiwabara, H.Maki (Dept. of Electrical Engng., Keio Univ., Kanagawa, Japan), T.Niimi. *J. Vac. Soc. Jpn. (Japan)*, vol.25, no.12, p.788-94 (1982). In Japanese.
 Arsenic and phosphorus-implanted silicon substrates have been annealed by a furnace with higher temperature and shorter time than those of the conventional furnace annealing. Carrier concentrations obtained by differential van der Pauw measurements lie on the as-implanted distribution, showing a complete electrical activation with negligible redistribution of dopants. The experimental values of Hall mobility coincide with those of the Irvin mobility, suggesting the regrowth of ion-implanted silicon. Diffusion profiles of dopants after the regrowth of ion-implanted silicon can be modelled by separating the regrowth and diffusion processes with an effective diffusion time. (20 refs.)
 61939 Changes induced by ion implantation in forsterite SiO₄ Mg₂. S.Massouh, C.Bovier, J.Serughetti (Dept. de Phys. des Materiaux, Univ. Claude Bernard, Villeurbanne, France). *Radiat. Eff. (GB)*, vol.65, no.1-4, p.73 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
 Summary form only given, as follows. The various methods of optical absorption spectroscopy, Rutherford back-scattering, transmission electron micro-

scopy and X-ray diffraction have been associated to study the high-dose ion implantation (150 keV, 10^{17} ions cm⁻²) phenomena in SiO₄Mg₂ single crystals. After thermal annealing at high temperature under vacuum or in atmosphere, different new phases appear: for an under vacuum anneal, the formation of solid solution is observed: SiO₄ (Mg, Fe)₂ by X-ray diffraction; for atmospheric anneal precipitates a spinelle phase of Fe₂O₄ or Mg Fe₂O₄. Preliminary results on the mechanical properties studied by creep technique will be discussed for these implanted and annealed crystals. (no refs.)

61940 Ion implantation and luminescence. F.J.Bryant (Dept. of Phys., Univ. of Hull, Hull, England). *Radiat. Eff. (GB)*, vol.65, no.1-4, p.81-93 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
 For insulators, the relationship between ion implantation and luminescence has been reviewed. Luminescence has been shown to be an important technique in the study of ion implanted layers and implantation mechanisms and the value of implantation doping in producing luminescence centres or devices has been discussed. Some particular topics have been chosen and considered to illustrate the useful relationship between luminescence and implantation. Cathodoluminescence studies have been used to investigate the importance of various implantation parameters in implantation doping. Identification of luminescence centres from post-implantation annealing treatments has led to an understanding of the lattice sites occupied by the implanted ions. The method of using optically-detected magnetic resonance (ODMR) to investigate implanted ions and the damage occurring during implantation has been illustrated by reference to phosphorus implantation in zinc selenide. The significance of depth-resolved cathodoluminescence in implantation studies has been briefly considered. Finally, the advantages of ion implantation in studying the role played by impurities in the radiation dosimeter material LiF are outlined. (33 refs.)

61941 Ion beam hydrogenation of polysilicon coated thermal oxide on silicon. J.Belson (Dept. of Electronic & Electrical Engng., Univ. of Surrey, Guildford, England). *Radiat. Eff. (GB)*, vol.65, no.1-4, p.95-9 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
 The annealing of bare thermal oxide on silicon at 400-500°C in a hydrogen bearing gas results in a reduced density of states N_{ss} at the substrate silicon/oxide interface. Treatments of this type have played a role in MOS processing schedules for several years. However, a similar approach applied to large areas (~cm²) of polysilicon coated oxide appears to be less effective in reducing N_{ss} . This may be due to the polysilicon acting as a partially impermeable barrier which tends to starve the substrate/oxide interface of hydrogen. In the present work hydrogenation of 2-inch diameter, polysilicon coated wafers has been accomplished by hydrogen ion implantation. H₂⁺ ions of 135 kV energy were implanted (to a dose of 10^{15} cm⁻²) through a 7000 Å polysilicon coating into an underlying 1400 Å SiO₂ layer. The polysilicon was removed after 30-min anneals carried out in pure N₂ at 300, 400 or 500°C. Aluminium dots, 1 mm in diameter were then deposited onto the oxide and high frequency (1 MHz) and quasistatic C-V curves recorded for determinations of N_{ss} . Control anneals on unimplanted material were carried out in pure N₂ and N₂-H₂ ambients. Control samples annealed in pure N₂ with their polysilicon coating intact had mid-gap N_{ss} values of not less than 4×10^{10} cm⁻² eV⁻¹. The corresponding value after N₂-H₂ anneals on polysilicon-free wafers was 3×10^{10} . H₂⁺ implanted samples annealed in pure N₂ with their hydrogenation may depend upon confinement of the associated displacement damage to the polysilicon. This allows the implanted hydrogen to be activated within the SiO₂ at temperatures similar to those employed for normal homogeneous gas annealing of the substrate silicon/oxide interface. (12 refs.)

61942 Chemical and catalytic effects of ion implantation. G.K.Wolf (Phys.-Chem. Inst., Heidelberg Univ., Heidelberg, Germany). *Radiat. Eff. (GB)*, vol.65, no.1-4, p.107-116 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
 Energetic particles are used for inducing chemical reactions as well as for modifying the properties of materials with regard to their bulk and surface chemical behavior. The effects are partly caused by radiation damage on phase intermixing, partly by the chemical properties of the individual bombarding particles. A survey of relevant applications of these techniques is presented which considers chemical reactions of implanted and recoil atoms and their use for syntheses, doping and labelling of compounds; the formation of thin films by decomposing chemical compounds with ion beams; catalytic effects on substrates treated by sputtering or ion implantation. Recent results with nonmetallic substrates are reviewed. Mainly hydrogenation reactions at a solid/gas interface or redox reactions at an electrified solid/liquid interface are mentioned. The present status and future prospects of these kinds of investigations will be discussed. (29 refs.)

61943 Implantation as a tool for performing selective materials (application to solar energy conversion). G.Chassagne, G.Abouchacra, J.Davenas, A.Delmas, C.Dupuy, J.Serughetti, M.Treilleux (Dept. de Phys. des Materiaux, Univ. Claude Bernard, Villeurbanne, France). *Radiat. Eff. (GB)*, vol.65, no.1-4, p.119-25 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
 A selective solar material must absorb most of the solar spectrum, principally the visible light, and reflect the IR light. Insulators are generally transparent in a wide part of the optical spectrum and the defects are revealed in these crystals by strong absorption bands. On the other hand, metals absorb much of the IR and near IR light and have a large reflection coefficient in the same region of the spectrum. In previous papers it has been shown that metallic colloids, formed by precipitation of impurities in insulators, are responsible for a strong absorption band. Such metallic inclusions may be easily produced in most insulators by implantation. According to the nature of the implanted metal a selective absorption can be obtained. So a composite material (cermet) may be performed combining a colloidal absorption in the visible and a metallic reflection. The authors discuss the different ways to achieve these properties using direct ion beam implantation. Various cermet (LiF:Na,Au; MgO:Na,Au) have been studied as function of energy (0.1-1 MeV) and dose (10^{16} - 10^{17} ions/cm²). Colloids are completely developed by consecutive annealing. The modelization of these cermet requires a careful characterization by optical methods (spectrophotometry) and microscopic investigation (TEM, SEM, RBS, SIMS). These techniques are used to determine the filling factor and the concentration profile of metal in the insulating matrix. With the help of the Maxwell-Garnett theory and using a single or multilayer model it is possible to suggest an interpretation of the optical properties. (9 refs.)

- 61944 Microhardness of an implanted system.** V.M.Gurov, A.I.Lyapin (Inst. of Mech. Engng., Mogilev, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1266-8 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2063-5 (Oct. 1982). [received: April 1983]
Results are reported from measurements of the microhardness of iron samples irradiated with W^{+} ions. It is shown that a PMT-3 microhardness gage can be used for such measurements. The data imply that solubility in the implanted layer can be assessed from the behavior of the microhardness as a function of the radiation dose. The properties of irradiated samples are found to vary when a DC current is passed through them. The radiation dose is the main factor determining whether the microhardness decreases or increases (i.e. the sign of the change). (1 ref.)

61945 Optical absorption calibration curve for measurement of CR content in semi-insulating GaAs. Xu Zhenjia, Zhang Zehua, Sun Bokang (Inst. of Semiconductors, Acad. Sinica, Peking, China). *Chin. J. Semicond. (China)*, vol.4, no.2, p.194-6 (March 1983). In Chinese. A method using infrared absorption is described for measuring Cr content in semi-insulating GaAs, which is calibrated by neutron activation analysis. The applicability of the calibrated curve is also discussed. (7 refs.)

61946 Some mathematical results for impurity redistribution during the growth of a layer on a substrate. F.Bailly, M.Barbe, G.Cohen-Solal, D.Lincot (Lab. de Phys. des Solides, CNRS, Meudon, France). *J. Phys. (France)*, vol.44, no.4, p.489-95 (April 1983). Presents a series of results for the redistribution by diffusion of an impurity initially distributed homogeneously in a substrate during the growth of a layer on this substrate. It also gives results concerning the diffusion during the same growth process of an impurity coming from an exterior phase. In both cases the nature of the layer is different from that of the substrate. In addition to the obtained analytical results, the mathematical method used to obtain them is also of interest. (3 refs.)

61947 Evaluation of the valency of Fe, Cr, Cu, Sb doping ions in $Pb(Zr_{0.95}Ti_{0.05})O_3$ ceramics. P.Gonnard, M.Trocac (Lab. de Génie Electrique & Ferroelectricite, INSA, Villeurbanne, France). *J. Solid State Chem. (USA)*, vol.47, no.1, p.92-7 (15 March 1983). The valency of the ions Fe, Cr, Cu, Sb, incorporated in PZT 95/5 ceramics, is evaluated from the viewpoint of a correlation between the mean radius of the ions at the octahedral site and the following two parameters: the temperature of the antiferroelectric-ferroelectric phase transition, and the volume of the cubic unit cell. It is found that Fe and Cr enter as Fe^{2+} and Cr^{2+} at the B site. Experiments suggest that Cu is incorporated at the B site as Cu^{+} and Cu^{2+} and that Sb enters partly at the A site as Sb^{3+} and mainly at the B site as Sb^{5+} . (15 refs.)

61948 Changes in the concentration of 1.0 and 1.28 eV copper luminescence centers during annealing of electron-irradiated n-type GaAs. K.D.Glinchuk, N.S.Zayats, A.V.Prokhorovich (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1189-90 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1851-2 (Oct. 1982). [received: April 1983]

The authors have investigated the influence of electron irradiation and subsequent annealing on the luminescence of n-type GaAs and the efficient 'recombination' interaction between gallium vacancies V_{Ga} of radiation origin and interstitial Cu, copper impurity atoms (mutual annihilation of V_{Ga} and Cu, took place), which increased the concentration of 1.0 and 1.28 eV luminescence centers containing substitutional Cu_{Ga} copper atoms. (3 refs.)

61949 Post-deposition high temperature processing of silicon nitride. H.J.Stein, P.S.Peercey, R.J.Sokel (Sandia Nat. Labs., Albuquerque, NM, USA).

Thin Solid Films (Switzerland), vol.101, no.4, p.291-8 (25 March 1983).

Hydrogen, which is normally incorporated in silicon nitride in the form of Si-H and N-H bonds, is lost by trap-limited diffusion during high temperature post-deposition processing. Hydrogen loss occurs from films prepared by both atmospheric pressure chemical vapor deposition and low pressure chemical vapor deposition and such loss appears to be unimpeded by polycrystalline silicon gate layers. The authors have found that partial reloading of hydrogen-depleted films to reform N-H and Si-H bonds can be achieved by annealing in H_2 gas at 900°C. It is inferred, therefore, that silicon nitride does not reconstruct when hydrogen is lost during high temperature processing. Changes in the equilibrium positive charge parallel changes in the hydrogen concentration in silicon nitride, consistent with a previously reported parallel behavior between positive charge and Si-H bonds. (11 refs.)

61950 Impurity incorporation in RAO polysilicon layers and consequences on their electrical properties. G.Revel, N.Deschamps (Lab. Pierre Sue, CENS, Gif sur Yvette, France), J.P.Deville, C.Texier-Hervo, C.Belouet. Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stressa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.970-5.

The growth of polysilicon layers by direct freezing of a film on a carbon ribbon by the RAD process goes along with a contamination of the silicon melt by carbon and its compositional impurities. The authors report on this contamination effect studied mainly by means of neutron activation analyses (NAA) and its consequences on the electrical properties of the layers. The purification of the carbon ribbons in chlorine at high temperatures results in low contamination levels of the melt; NAA evidenced a significant segregation at the growth front, the effective partition coefficients determined being in the 10^{-1} to 10^{-3} range. Even though impurities are shown to impair the device performances, it is concluded that they are not necessarily incorporated in an electrically active form. Finally, AM_1 conversion efficiencies of 12% are reported for RAD cells 4 cm² in size. (8 refs.)

61.70Y Interaction between different crystal structure defects

61951 On the microhardness induced by impurity ions in the NaCl and KCl single crystals. S.R.Ghadekar, B.T.Deshmukh (Dept. of Phys., Nagpur Univ., Nagpur, India).

Curr. Sci. (India), vol.51, no.23, p.1109-11 (5 Dec. 1982).

The authors investigated the effect of dopant ions on dislocation density and microhardness of NaCl and KCl. It is found that the dopant ions with large ionic radii increase the microhardness by increasing the dislocation density due to lattice strains. Multivalent dopants create ion vacancies which provide obstacles to the dislocation motion thereby raising the microhardness of the crystals. (6 refs.)

61952 Interaction of lithium with multiply charged acceptors in germanium. G.M.Gavrilov, L.A.Goncharov, P.D.Kervashvili, N.V.Pan'kevich (50th Anniversary of the Great October Socialist Revolution Kiev Polytech. Inst., Kiev, Ukrainian SSR).

Inorg. Mater. (USA), vol.18, no.5, p.605-9 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.715-19 (May 1982). [received: Feb. 1983]

An analysis of the data obtained showed that when Li and a multiply charged impurity Ag, Fe, or Ni are introduced into germanium directly in the processes of crystallization, an interaction between them unquestionably occurs; moreover, the nature of this interaction varies. The main process of interaction of Li and Ag and of Li with Fe is electrical compression. The interaction of Li and Ni is of a more complex nature; in this case the possibility of formation of stable electrically active complexes should be taken into consideration. (7 refs.)

61953 On the interaction between a vacancy and an interstitial impurity atom in BCC transition metals. K.Masuda (Dept. of Materials Sci. & Engng., Tokyo Inst. of Technol., Tokyo, Japan). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.9-16 (1 March 1983). The binding energies are calculated between a vacancy and an interstitial impurity (like carbon) atom in BCC transition metals (α -Fe, Mo, and W). The changes in the total energy due to the introduction of lattice defects are calculated using a tight-binding type electronic theory and the Born-Mayer repulsive potential. A comparison is made with previous theoretical calculations as well as the recent experimental observations (positron annihilation experiments). In addition the detailed electronic structure is investigated of the impurity atom, assuming both, interstitial and substitutional occupations and using the recursion method by Haydock et al. (1972, 1975). It is shown that there are marked differences in the local p -orbital density of states between the octahedral and substitutional impurity (carbon) atoms. These calculations enable one to understand the stability of the vacancy-interstitial impurity pair in BCC transition metals. (20 refs.)

61954 Interactions between dislocations and grain boundaries in BCC metals. S.G.Zaychenko.

Russ. Metall. (GB), no.6, p.125-9 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.126-9 (1981).

On the example of α -Fe, computer calculations were made of the interactions between the dislocations in BCC metals and the boundary type (010), which separates a grain containing the dislocation from an adjacent one, displaced by the angle θ about [001]. The calculations were made within the framework of the anisotropic theory of elasticity. It is shown that the interaction consists of attraction for small disorientation angles, between 0 and 20°, and repulsion in the case of disorientations between 20 and 70°. Effect of the interaction: presence around the boundaries of areas free of dislocations, the dimensions of which are proportional to the interaction force between the dislocations and the boundary. (5 refs.)

61955 Interaction of primary radiation defects with dislocations in indium antimonide. F.A.Zaitov, O.V.Gorshkova, A.Ya.Polyakov.

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1198-9 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1863-5 (Oct. 1982). [received: April 1983]

The interaction of neutron irradiation defects with dislocations is considered in InSb. The authors consider the dose dependence of the concentration of acceptors, donors and deep levels and the changes in the electron mobility. (19 refs.)

61956 Drift forces on vacancies and interstitials in alloys with radiation-induced segregation. W.G.Wolfer (Nuclear Engng. Dept., Univ. of Wisconsin, Madison, WI, USA).

J. Nucl. Mater. (Netherlands), vol.114, no.2-3, p.292-304 (Feb. 1983).

Linear irreversible thermodynamics is employed to derive the total drift force on interstitials and vacancies in substitutional binary alloys. The obtained results are evaluated for binary Fe-Ni alloys. It is shown that radiation-induced segregation produces new drift forces which can be of the same order of magnitude as the stress-induced drift force produced by edge dislocations in an alloy with uniform composition. Hence, segregation results in a significant modification of the bias for void nucleation and swelling. The additional drift forces on interstitials and vacancies are due to the compositional dependence of the formation and migration energies; due to the dependence of the point defect strain energy on the local elastic properties; due to a coherency strain field caused by lattice parameter variations; and finally due to the Kirkendall force produced by the difference in tracer mobilities. Estimates of these forces given for Fe-Ni alloys indicate that the Kirkendall force is small compared to the other segregation-induced forces on interstitials. In contrast, the Kirkendall force seems to be the dominant one for vacancies. (29 refs.)

61957 On the rate theory for pulsed irradiation. H.Rauh, R.Bullough, M.H.Wood (Theoretical Phys. Div., AERE, Harwell, England).

J. Nucl. Mater. (Netherlands), vol.114, no.2-3, p.334-37 (Feb. 1983).

To date, no rigorous chemical rate theory framework has been established to allow for the pulsed mode of operation. Previous dynamical studies have only included the consequences of the transient damage rate in the concentration fluctuations and not in the sink strengths themselves, the adopted sink strength being those derived for a continuous damage rate. The authors have developed a more general dynamical rate theory and present first results for pulsed irradiation. (6 refs.)

61958 Internal stress buildup in SIPA creep. B.L.Adams (Dept. of Materials Sci. & Engng., Univ. of Florida, Gainesville, FL, USA).

J. Nucl. Mater. (Netherlands), vol.115, no.1, p.49-55 (March 1983).

A discrete simulation of internal stress effects, arising during stress-induced preferred-absorption (SIPA) irradiation creep, has been conducted for randomly oriented linear-elastic FCC polycrystals. Of particular interest are the intercrystalline incompatibility stresses arising during the development of faulted interstitial loops (Frank loops). These simulations suggest that a unique state of internal stress can develop at a sufficiently large loop volume-fraction. As this state is approached the deviatoric creep-rate reduces to zero. Extensive microstructural data suggest, that unfaulting processes limit loop volume-fractions to levels consistent with a maximum reduction in creep-rate of ~18%. A substantial coupling effect is predicted between faulted loop SIPA and other SIPA mechanisms, such as preferred absorption at perfect dislocations (SIPAD), and climb controlled glide (CCG). Faulted

loop SIPA coupled with CCG creep leads to an enhanced creep-rate. The opposite effect is predicted for the coupling with SIPAD creep. (31 refs.)

61959 Flash lamp annealing of ion-implanted polycrystalline silicon. K.B.Kadyrakunov, E.V.Nidaev, A.E.Plotnikov, L.S.Smirnov, I.G.Melnik, M.V.Makeev (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).

Phys. Status Solidi a (Germany), vol.75, no.2, p.483-8 (16 Feb. 1983). In German.

The behaviour of phosphorus implanted films of polycrystalline silicon deposited on SiO₂ is studied during the annealing with pulses of a xenon lamp of 10⁻² s duration. It is shown that the annealing with flash lamp pulses allows a complete activation of an implanted impurity during the annealing both in solid and in liquid phase. The melting of the film surface is accompanied by an increase of crystal sizes up to 5 μ m. The electron mobility in these layers reaches 250 cm²V⁻¹s⁻¹. The layers are stable to the subsequent heat treatments at temperatures up to 900K. (10 refs.)

61960 Point defect densities during the early transient stage of radiation-induced metal swelling. V.A.Pechenkin.

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1051-6 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1712-20 (Sept. 1982). [received: April 1983]

The behavior of point defect densities during the initial period of irradiation is studied analytically and by solving the material balance equations numerically. Estimates are derived for the characteristic formation time of loops of interstitial atoms, the density and diameter of interstitial atoms, and the duration of the transient period. The influence of the transient density stage on radiation-induced porosity in metals is studied. (15 refs.)

61961 Microscopic processes in low-power annealing of ion-implanted Ge. G.Vitali, M.Marinelli, U.Zammit (Istituto di Fisica, Facoltà di Ingegneria, Univ. of Rome, Rome, Italy), F.Scuderi.

Phys. Lett. A (Netherlands), vol.94A, no.6-7, p.320-4 (21 March 1983).

Recrystallization due to low-power ruby laser annealing of ion-implanted Ge is shown to be associated with small-scale migration of defects. In the present case no fusion processes can be invoked. The experimental analysis was performed with scanning (SEM) and transmission electron microscopy (TEM), and reflection high-energy electron diffraction (RHEED) techniques. (20 refs.)

61962 Spatial and size distributions of inhomogeneities initiating laser breakdown in alkali halide crystals at 10.6 μ m. A.V.Gorbanov (Inst. of Solid State Phys., Acad. of Sci., USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.7, p.343-4 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.792-5 (July 1982). [received: April 1983]

Reports a systematic study of the size effect in the breakdown of NaCl and KCl by pulses from a TEA CO₂ laser ($t_p=100$ ns), not only in the volume but also at the surface. The size dependence was studied in detail, and the author did not use randomly selected samples. Instead, samples were cleaved from various parts of large single-crystal bars grown from the melt by the Kyropoulos method with diameters and heights up to 200 mm. With some reservation it may thus be suggested that the nature of the breakdown centers did not change as their quantitative characteristics were varied. (12 refs.)

61963 In-resonator laser annealing of semiconductors. Yu.V.Koval'chuk, G.V.Ostrovskaya, V.B.Smirnitskii, O.V.Smol'skii, I.A.Sokolov (A.F. Ioffe Physicotechn. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.398-9 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.917-20 (Aug. 1982). [received: April 1983]

Reports a study of the in-resonator laser annealing of GaP and GaAs wafers after ion implantation. The experiments show that it is necessary to control the orientation of the samples with respect to the laser beam during laser annealing in order to achieve reproducible results; alternatively, the laser oscillator must be optically decoupled from the laser amplifier stages. (3 refs.)

61964 Thermal model for interference laser annealing. V.N.Abakumov, Zh.I.Alferov, Yu.V.Koval'chuk, E.L.Portnoi.

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.417-18 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.966-70 (Aug. 1982). [received: April 1983]

Analyzes interference laser annealing by studying the intensity distribution of the laser beam over the surface of the sample during the interference of two plane waves. There is a change in the absorption not only along the direction into the target (the y direction), which is the only direction in conventional laser annealing, but also along the surface (the x direction), perpendicular to the lines of the grating. For the analysis, the authors adopt a thermal model with melting and crystallization of a damaged surface layer. For a graphic description of the annealing they consider a simplified problem: the solid phase and the melt are isotropic, have a constant specific heat c , a thermal conductivity k , and the same density ρ . - 61966** Radiation induced effects and annealing methods in fiberoptics and glasses. H.Bock, J.Siehs, N.Vana (Atominst. of the Austrian Univ., Wien, Austria). *Radiat. Eff. (GB)*, vol.65, no.1-4, p.75-8 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
- Radiation induced effects in glass-rods and fiberoptics have been studied to determine parameters affecting the application of these materials in nuclear technology, i.e. as fiberscopes for visual inspection in severe radiation environments. Different glass and fibertypes have been exposed to fission product gamma radiation. The radiation induced transmission loss was measured with a spectrophotometer and then different annealing methods were examined to improve the transmission properties again. Especially the changes in glass and fiber recovery vs. time as a function of radiation dose and annealing temperature were investigated. Annealing experiments were performed exposing the samples either to temperature treatment or to various light sources such as quartz lamp, arc lamp or UV-laser for optical annealing. The transmission recovery was then investigated either as a function of annealing temperature or of exposure time to the light sources. The results allow conclusions on the design and composition of optical fiber endoscopes to be used in severe radiation environment where image transmission is required in the presence of high level nuclear radiation. (2 refs.)
- 61967** Radiation-induced transmission loss in optical materials at infrared wavelengths. H.U.Fahrbach, A.Eberhagen (Max-Planck-Inst. für Plasma-phys., Garching, Germany). *Radiat. Eff. (GB)*, vol.65, no.1-4, p.127-30 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
- Information concerning the effect of irradiation on the optical properties of materials in the infrared, sub-mm- and mm-wavelength regions is of increasing importance in fusion plasma diagnostics. The radiation induced transmission loss of a number of materials has therefore been investigated at wavelengths in the ranges 200 nm to 40 μ m and 0.23 to 2.0 mm. The samples were irradiated with doses of up to 10^{10} rad in a nuclear reactor. While germanium shows considerable transmission loss at doses as low as 10^6 rad, and the transmission of TPX decreases at 10^9 rad, other materials, e.g. fused quartz and possibly ZnSe, exhibit sufficient radiation hardness for use in fusion plasma diagnostics. (10 refs.)
- 61968** Intrinsic defects in silicon and their interaction with boron impurities at low temperatures. V.V.Emtsev, T.V.Mashovets, E.Kh.Nazaryan (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Semicond. (USA)*, vol.16, no.10, p.1225-7 (Oct. 1982). Translation of: *Fiz. i Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1901-4 (Oct. 1982). [received: April 1983]
- Describes an investigation of the process of formation of defects in Si:B under conditions of low-temperature (4.2 and 78K) gamma irradiation. This was the first study of the effects of irradiation of p-type silicon with gamma rays at 4.2K. Moreover, the concentrations of group III acceptors and of compensating donors before and after low-temperature irradiations were determined separately for the first time. (21 refs.)

Phys.-Semicond. (USA)*, vol.16, no.10, p.1230-1 (Oct. 1982). Translation of: *Fiz. i Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1907-9 (Oct. 1982). [received: April 1983]
- The authors investigate the influence of radiation defects on electronic processes in n-type Ge-Si solid solutions. The Hall effect and the electrical resistivity were determined for antimony-doped Ge-Si single crystals at temperatures 10-300K. At room temperature the resistivity was 5 Ω cm and the difference between the donor and acceptor concentrations was 7×10^{14} cm $^{-3}$. The concentration of the second compound of the solid solutions was 0.01-1.5 at% Si. These crystals were irradiated with 2.5 MeV electrons and with ^{60}Co γ rays at room temperature. A study was made of the isochronous and isothermal annealing of defects. The annealing took place in the range 300-660K and measurements were made at 90K after the various annealing stages. In the isochronous annealing case the period at each temperature was 15 min. (10 refs.)

- 61970** Heating of a bilayered material bombarded by an electron beam. P.Montmitonnet, E.Dargue-Ceretti (Ecole des Mines de Paris, Valbonne, France). *J. Microsc. & Spectrosc. Electron. (France)*, vol.7, no.6, p.615-27 (Dec. 1982). In French.
- The temperature of a target bombarded by an electron beam is calculated analytically for a two-layered cylindrical material. No other geometric restriction is assumed. The model is compared with previous approximate calculations,

using more restrictive hypotheses. For very thin films, the present model confirms Roll's analysis. Furthermore, it allows precise calculation under quite general geometrical conditions. (8 refs.)

- 61971** Determination of electron depth-dose function for kilovolt electrons on GaAsP. G.Oelgart, H.Scholz (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany). *Phys. Status Solidi a (Germany)*, vol.75, no.2, p.547-53 (16 Feb. 1983).
- A new technique to determine the depth-dose function is described using the measurement of the electron beam induced barrier current on bevelled homo p-n junction structures. A universal depth-dose function on GaAsP is found in the form $\Phi(z) = \Phi_0 \exp[-(z-a/z_0)^2]$ with $z_0 = 2.3a$ for $z \geq a$ and $1.3a$ for $0 \leq z < a$ in the investigated energy range from 10 to 45 keV. The distance of the maximum under the surface can be obtained by the relation $a = A_0 E_p^{0.65}$ with $A_0 = 2.95 \times 10^{-3}$ (E_p in keV, a in μ m). (8 refs.)
- 61972** Irradiation damage of II-VI compounds in a high-voltage electron microscope. T.Yoshiie, H.Iwanaga, N.Shibata (Faculty of Liberal Arts, Nagasaki Univ., Nagasaki, Japan), K.Suzuki, M.Ichihara, S.Takeuchi. *Philos. Mag. A (GB)*, vol.47, no.3, p.315-29 (March 1983).
- Dislocation loops produced by electron irradiation on a 1 MV electron microscope have been studied above room temperature for five II-VI compounds: CdS and ZnO, with the wurtzite structure, and CdTe, ZnSe and ZnS, with the zincblende structure. For all the crystals the density of loops decreased as the irradiation temperature increased, until no loops were produced above a certain temperature which varied from crystal to crystal. However, the loop density did not depend on the electron flux intensity, suggesting the heterogeneous nucleation at some impurity complex of equilibrium concentration. Diffraction contrast analyses showed that the loops are of interstitial type in each crystal, with Burgers vectors as follows: $1/2[0001]$ and $1/3[1120]$ for wurtzite crystals, the density ratio of the former type to the latter being increased with increasing temperature; mostly $1/3[111]$ and a few $1/2[110]$ for zincblende crystals, the latter type being presumably formed as a result of unfaulting in the former. An effect of crystal polarity on the shape of the loops in zincblende crystals has been observed. (21 refs.)
- 61973** Radiation damage in pure and helium-doped α - Al_2O_3 in the HVEM. Qualitative aspects of void and aluminium colloid formation. T.Shikama, G.Pells (Metall. Div., AERE, Harwell, England). *Philos. Mag. A (GB)*, vol.47, no.3, p.369-79 (March 1983).
- Thick foils of α - Al_2O_3 single crystals of both high purity and doped with 1000 at p.p.m. helium have been irradiated with 1 MV electrons at temperatures of 900-1130K in a high-voltage electron microscope (HVEM). Following irradiation the foils were thinned further and examined at room temperature in the HVEM by both bright-field and dark-field techniques. Both helium-doped and undoped samples exhibited three radiation damaged products which could be observed in bright field. These were dislocation tangles and small features which exhibited white or dark contrast. The white features showed the contrast behaviour of voids, whilst the dark features were best observed using diffraction contrast. Additional diffraction patterns were indexed as being from aluminium metal which, viewed in dark field, showed images corresponding to the dark features observed in bright field. Confirmation that the dark features were aluminium metal precipitates was obtained from loss of diffraction contrast when the specimen was heated above the melting point of aluminium. (10 refs.)
- 61974** Damage in the cation sublattice of α - Al_2O_3 irradiated in an HVEM. A.Y.Stathopoulos (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England), G.P.Pells. *Philos. Mag. A (GB)*, vol.47, no.3, p.381-94 (March 1983).
- α - Al_2O_3 has been irradiated at high temperatures with 300 keV electrons at which energy only aluminium ions are displaced. Systematic examination in a 100 kV electron microscope revealed pure edge dislocations of interstitial character with $b = 1/3[0001]$ and $b = 1/3[1010]$ lying on basal and prismatic $\{1010\}$ planes respectively. The loops are stoichiometric but faulted on the aluminium sublattice. A model is proposed by which cation displacement at high temperatures results in aluminium interstitials precipitating between basal or $\{1010\}$ prismatic planes with simultaneous diffusion of oxygen ions between the aluminium layers producing the faulted loops. (14 refs.)
- 61975** Microstructural changes in irradiated silica based glasses. M.Antonini, A.Manara (Joint Res. Center, Ispra, Italy), S.Buckley. *Radiat. Eff. (GB)*, vol.65, no.1-4, p.55-61 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
- High voltage electron microscopy studies have been performed on irradiated pure silica and borosilicate glasses to check their long-term stability when these materials are employed near high energy radioactive sources, such as in fusion reactors and during the storage of nuclear waste. The intense energetic beam of electrons produced by the Harwell 1 MeV microscope, ranging from 10^{17} to 10^{20} e/cm 2 /s has been focused upon specimens of various composition and impurity content at different temperatures up to about 850°C. Pure silica samples have also been bombarded with 46.5 MeV Ni^{16+} ions at the Variable Energy Cyclotron. It is found that while no significant changes are detectable in pure irradiated silica, clear evidence is present in complex borosilicate glasses for the growing of large defect clusters (over 1000 Å, resembling gas bubbles) after electron doses of about 8.5×10^{19} e/cm 2 and dose rates exceeding 2×10^{18} e/cm 2 /sec. Moreover, small regions, about 100 Å wide, scattering electrons more than the matrix are also present. The nature of this fine microstructure has been established as a phase separation into crystalline tridymite. The observations are discussed in terms of their dependence on temperature, sample thickness, dose and dose rates. (18 refs.)
- 61976** Effect of prior large scale electron irradiation on crystallization in two Fe-Ni based metallic glasses. E.Schopf, M.von Heimendahl (Univ. Erlangen-Nürnberg, Erlangen, Germany). *Scr. Metall. (USA)*, vol.17, no.3, p.313-16 (March 1983).
- Amorphous metallic alloys Metglas 2826 and 2826A were subjected to a high energy electron irradiation of 1500 kV, 3.4×10^{18} e/cm 2 , at low temperature (about 100K) within an electron accelerator (Dynamitron). Afterwards, the specimens were heated in case of 2826A to 341°C or 381°C and in case of 2826 to 342°C or 386°C to produce crystallization. Whereas in 2826A nucleation of crystals was enhanced due to irradiation and growth was not influenced, in 2826 both nucleation and growth were unchanged. These results are in qualitative agreement with former in-situ HVEM experiments on the same alloys and are discussed in terms of incubation times, related to relaxation times. (14 refs.)
- 61977** The temperature dependence of the electron irradiation resistance of crystalline paraffin. R.H.Wade, J.Pelissier (CENG, Grenoble, France). *Ultramicroscopy (Netherlands)*, vol.10, no.3, p.285-90 (1982).
- Reports experimental data on the radiation resistance of crystalline paraffin for temperatures ranging upwards from helium temperature in the hope of throwing some light on the apparent incompatibility of previously published results. The method adopted was to follow the evolution of the electron diffraction pattern intensities as a function of the total electron dose. The latent

dose effect found by Siegel (1982) was confirmed by the low temperature results. (19 refs.)

- 61978 Radiation conversions in MgCr₂O₄. Yu.G.Chukalkin, V.V.Petrov, I.N.Dubrovina, B.N.Goshchitskii (Inst. of Metal Phys., Ural Sci. Center, Acad. of Sci., Sverdlovsk, USSR). *Inorg. Mater. (USA)*, vol.18, no.6, p.1055-7 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.894-6 (June 1982). [received: Feb. 1983]

The irradiation of compounds with a spinel structure with fast neutrons leads to a statistical redistribution of di- and trivalent cations over the tetrahedral (8a) and octahedral (16d) positions of the crystal lattice. Therefore, an attempt to fix Cr³⁺ ions in tetrahedral positions by irradiation was made. The object of investigation was magnesium chromite MgCr₂O₄. The samples were irradiated in a nuclear reactor at 343K with a flux of fast neutrons ($E_H \geq 1$ Mev) 2×10^{20} cm⁻². With the indicated flux, the sample should be entirely randomized. To investigate the structural changes the authors used a neutron diffraction method. The initial samples had a spinel structure (space group Fd3m), characterized by the lattice parameter $a = 8.33$ Å. Irradiation with fast neutrons radically changes the structure of the investigated compound. The diffraction picture of the irradiated sample corresponds to a structure of the NaCl type (space group Fm3m) with parameter of the unit cell equal to 4.18 Å. (3 refs.)

- 61979 Vacancies and carbon impurities in α -iron: neutron irradiation. P.Hautojarvi, L.Pollanen, A.Vehanen, J.Yli-Kauppi (Lab. of Phys., Helsinki Univ. of Technol., Espoo, Finland). *J. Nucl. Mater. (Netherlands)*, vol.114, no.2-3, p.250-9 (Feb. 1983).

Positron annihilation and resistivity measurements have been performed on neutron-irradiated pure Fe, Fe-50 at ppm C and Fe-750 at ppm C. Small vacancy clusters are observed already in the as-irradiated state at 77K. Vacancy migration is found to start at around 160K as correlated within the collision cascades. This results in additional vacancy agglomeration and carbon impurities have no effect on the phenomenon. At 350K carbon atoms segregate strongly around the existing vacancy clusters. All defects anneal out below 600K. (43 refs.)

- 61980 Low temperature neutron and gamma irradiation of glass fiber reinforced epoxies. H.W.Weber (Antoniustitut der Österreichischen Univ., Wien, Austria), E.Kubasta, W.Steiner, H.Benz, K.Nylund. *J. Nucl. Mater. (Netherlands)*, vol.115, no.1, p.11-15 (March 1983).

Measurements of the fracture strength of epoxies, which are reinforced with different types of fiber glass and used commercially for magnet insulation are described. The samples were exposed to reactor irradiation at 77K, and measurements of tensile strength in the direction of the fibers were taken at the same temperature without warm up. The results show moderate degradation of the fracture strengths up to a total dose of 7.4×10^5 Gy, a linear swelling by about 5% at the same dose and a total destruction of the composite after a dose of $\sim 1.5 \times 10^6$ Gy. (7 refs.)

- 61981 Effects of quenching and fission damage on the low temperature electrical resistivity of single crystal UO₂. H.Matsui, M.Horiki, N.Ohya, T.Kato, M.Osada (Dept. Nuclear Eng., Nagoya Univ., Nagoya, Japan). *J. Nucl. Mater. (Netherlands)*, vol.115, no.1, p.128-30 (March 1983).

The electrical resistivity of single crystal UO₂ at low temperatures was measured. Some specimens were investigated in aligned crystal directions [100] and [110]. Effects of crystal defects on the electrical resistivity were examined by an introduction of vacancies by quenching and of the Frenkel-type defects by neutron irradiation (fission damage). It was found that the temperature dependence of the resistivity could be divided into three regions for all samples investigated here, except the irradiated one. (9 refs.)

- 61982 The effects of ionizing radiation on HLW glasses. D.R.Cousens, S.Myhra (School of Sci., Griffith Univ., Nathan, Queensland, Australia). *J. Non-Cryst. Solids (Netherlands)*, vol.54, no.3, p.345-65 (March 1983).

The production of displacement damage in HLW glasses has been accelerated by a factor of 10³ by neutron-irradiation of a typical borosilicate glass which has been doped with up to 10% UO₂ so that (α, n) and (n, f) events are produced. The energetic products of these reactions constitute the primary knock-ons which initiate displacement cascades. A stored energy of ≈ 100 kJ/kg has been measured with differential scanning calorimetry. The effects of positive ion 'self-irradiation' on the chemical durability of the glass have been investigated by studying the leaching/dissolution of irradiated and control powder specimens in an aqueous solution. The initial leaching/dissolution rates for Li, Sr and Si are enhanced by a factor of 2-4 by irradiation while the longer term rates are typically increased by 50%. The effects of back-reactions and changing particle size distribution complicate the interpretation of the result. The release of some activation products and fission fragments have been monitored; most species are well retained, but Ru exhibits an anomalously high leaching rate. (17 refs.)

- 61983 Energy deposition effects on amorphous selenium, by low temperature neutron irradiation. E.Bonjour, R.Calemczuk (CENG, Grenoble, France). *Radiat. Eff. (GB)*, vol.65, no.1-4, p.79 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Summary form only given, as follows. The authors have observed recently that neutron irradiation at low temperature can induce very strong changes in configurational disorder of glasses. This conclusion has been drawn from

enthalpy change diagrams performed near T_g by differential scanning calorimetry, on amorphous selenium. A progressive change was observed from a stabilized relaxation state to a highly quenched state as a function of the neutron dose. They explain these effects by a local heating process. The irradiation was done at low temperature (30K) and fission and capture effects were shielded by enclosing samples in NB cells. (no refs.)

- 61984 Friction and source hardening in irradiated mild steel. K.L.Murty, D.J.Oh (North Carolina State Univ., Raleigh, NC, USA). *Scr. Metall. (USA)*, vol.17, no.3, p.317-20 (March 1983).

The effect of neutron fluence on stress-strain behavior of mild steel at ambient temperature revealed that Luders strain increases with fluence, and at the highest fluence employed here, namely 1.4×10^{19} n/cm², fracture occurred during Luders propagation. The lower yield stress increased as cube root of fluence and friction stress increased as square root of fluence. The interstitial impurity atoms (C and N) combine with irradiation induced defects, thereby resulting in reduced net concentration of free C and N in solution, and thus the source pinning effect decreases in irradiated steels as observed here. The increase in Luders strain with the corresponding decrease in source hardening resulted in reduced work-hardening in irradiated steels as expected. (10 refs.)

- 61985 An investigation into the potential importance of helium trapping during the nucleation of radiation-induced voids. M.P.Shaw, B.Ralph, W.M.Stobbs (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England). *J. Nucl. Mater. (Netherlands)*, vol.115, no.1, p.1-10 (March 1983).

Transmission electron microscopy has been used to investigate the effect of small modifications in the concentration of γ -forming elements (Al, Ti and Si), in a model nickel-based superalloy, upon the formation of helium bubbles during post-implantation annealing. The results show that bubble formation and growth can be significantly influenced, and in some cases inhibited, depending upon specific combinations of elements that partition to γ . The results are discussed in relation to the possible mechanisms involved and their potential importance in minimizing void swelling in nuclear reactor constructional materials. (20 refs.)

- 61986 Precipitation and void-swelling in nickel-manganese austenitic stainless steels. R.M.Boothby, D.R.Harries, T.M.Williams (Metall. Div., AERE, Harwell, England). *J. Nucl. Mater. (Netherlands)*, vol.115, no.1, p.16-24 (March 1983).

The precipitation and void-swelling characteristics of austenitic stainless steels in which nickel is partially replaced by manganese have been investigated. Alloy compositions were chosen on the basis of manganese being half as effective as nickel in stabilizing austenite, and steels with 'nickel equivalent' contents of 25-37% were examined. The steels were irradiated with 46 MeV Ni⁶⁺ ions to 60 dpa at 625°C and also aged for 1000 h at 600°C. The high-Mn alloys (20-30% Mn) were very susceptible to the formation of inter-metallic phases during thermal ageing but less so in the shorter-duration irradiation experiment. Irradiation promoted the formation of Ni- and Si-rich phases—the silicide G phase (in which Mn can replace Ti) and in one instance M₆C. The Cr-rich carbide M₂₃C₆ formed in both the aged and irradiated steels. Among the high-Mn alloys, void-swelling decreased with increasing Ni and (Ni+Mn) contents, although a 25Ni-1Mn steel showed no swelling at 625°C. (30 refs.)

- 61987 On the critical dose for blistering in helium irradiated zirconium and Zr-Nb. R.H.Zee, J.F.Watters, O.M.Westcott (AECL, Chalk River, Nuclear Engng., Chalk River, Ontario, Canada). *J. Nucl. Mater. (Netherlands)*, vol.115, no.1, p.131-3 (March 1983).

A study was carried out in order to determine the critical dose for blister formation in pure Zr and Zr-Nb (0.25 wt.%) under helium ion irradiation. Specimens in the annealed and 40% cold-worked condition were used. It was found that alloying was more important than plastic deformation in reducing blister formation. (9 refs.)

- 61988 The influence of helium implantation profile shapes on blister formation in metals. I.M.Neklyudov, V.F.Rybalko, G.D.Tolstolutsaya (Inst. of Phys. & Technol., Acad. of Sci., Kharkov, Ukrainian SSR). *J. Nucl. Mater. (Netherlands)*, vol.115, no.1, p.134-6 (March 1983).

Experimental results revealing the influence of the helium implantation profiles on blister formation are presented. (10 refs.)

- 61989 Direct observation of the primary state of damage of ion-irradiated tungsten. II. Definitions, analyses and results. M.I.Current, C.-Y.Wei, D.N.Seidman (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA). *Philos. Mag. A (GB)*, vol.47, no.3, p.407-33 (March 1983).

For pt.I see *ibid.*, vol.44, p.459 (1981). In a previous paper (Wei, Current and Seidman, 1981) the results of an extensive field-ion microscope investigation of the vacancy portion of the primary state of damage of ion-irradiated tungsten specimens were presented. The vacancies were contained in depleted zones (DZs) which had been created, at ≤ 15 KeV, by a variety of single projectile ions with initial energies in the range 15 to 70 keV. In this paper the definitions of all the principal quantities used to characterize the three dimensional vacancy population with a DZ are presented; that is, the number of vacancies, the average diameter and orientation of a DZ with respect to the incident ion beam, the average vacancy concentration within a DZ, the radial distribution functions and the first-nearest-neighbour cluster functions. All the DZs are analysed in great detail, using these principal quantities, and the results are presented in graphical form. In addition, many other detailed physical properties of DZs are presented. (32 refs.)

61990 Radiation damage, its recovery and platinum behavior and lattice location in ion bombarded MgO and Al₂O₃ as used for catalytic studies. H.Matzke (European Inst. for Transuranium Elements, Karlsruhe, Germany), A.Turos, P.Rabette.

Radiat. Eff. (GB), vol.65, no.1-4, p.1-9 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Channeling and back-scattering techniques were used to study single crystals of α -Al₂O₃ and MgO following bombardment with Pt- (or Xe-) ions of 30 keV energy and doses between 9×10^{15} and 8×10^{16} ions/cm², as used for catalytic investigations. The MgO crystals showed saturation damage after implantation with the lower dose. Damage recovery proceeded progressively with increasing temperature and was not complete before 1300°C was reached. The Pt formed coherent precipitates. In contrast, a quasi-amorphous zone was formed on ion bombarded Al₂O₃. Outdiffusion of the impurity and recovery of the bombardment damage started at ~650°C, the temperature of the phase change to the recrystallized state. At temperatures in excess of 900°C, the Pt precipitated into small single crystal grains of near spherical shape. The results can be used to interpret the catalytic behavior of the systems Pt/single crystalline support. (13 refs.)

61991 Nuclear and electronic energy loss of noble gas ions bombarding solid benzene and relative chemical effects. O.Puglisi, G.Marletta, A.Torrisi (Istituto Dipartimentale di Chimica e Chimica Industriale, Catania, Italy), G.Foti, L.Torrisi.

Radiat. Eff. (GB), vol.65, no.1-4, p.11-16 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Solid benzene has been bombarded with several inert gas ions at various energies ranging between 15-100 keV. Under these conditions the energy deposition (η) which occurs via nuclear collisions ranged between $4 \times 10^{-3} \pm 1$ of total energy loss. After implantation many products have been found in the target, and good correlation between the C₁₃ product yield and η has been found. This correlation is explained in terms of different fragmentation events which occur after electronic nuclear energy deposition. (7 refs.)

61992 Ion implantation effects in glasses. G.W.Arnold (Sandia Nat. Labs., Albuquerque, NM, USA).

Radiat. Eff. (GB), vol.65, no.1-4, p.17-30 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Ion implantation can be used to introduce network damage and to alter the chemical composition in glasses. Structural changes can be inferred from IR measurements near 1000 cm⁻¹ and by optical absorption near 2150 Å. Implantation-induced damage decreases the implanted volume in fused silica with consequent changes in the refractive index, the near-surface hardness, and the tensile surface stress. Prior work in these areas is reviewed. Implantation into alkali silicate glasses depletes the alkali content in the implanted region. These changes allow preferential surface crystallization in Li₂O-2SiO₂ glasses. Crystallization of amorphous SiO₂ can be induced by implantation of Li. Insight into the crystallization process is obtained by following the associated ion movement by elastic recoil detection (ERD) and optical techniques. Implantation of 20 keV H shows that saturation of implanted H-sites in fused silica occurs at about 2.2×10^{21} H/cm² in agreement with free volume estimates of the maximum number of available interstitial sites. Details of H and D interactions in fused silica were studied as a function of fluence and temperature. Results are of interest in studies of corrosion in glasses considered for nuclear waste encapsulation and for components in fusion reactors. (30 refs.)

61993 Optical, chemical and mechanical modifications induced by ion implantation on glass surfaces. V.Chinellato (Stazione Sperimentale del Vetro, Murano, Italy), V.Gottardi, S.Lo Russo, P.Mazzoldi, F.Nicoletti, P.Polato.

Radiat. Eff. (GB), vol.65, no.1-4, p.31-9 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Soda-lime glasses have been implanted with 50 keV Ar ions. Modifications induced on the glass surface have been studied as a function of implanted dose, with particular regard to optical, chemical and mechanical properties. Optical measurements indicate a reduction of the refractive index, connected to the surface sodium content. The sodium profile has been measured using the Na²³(p,α)Ne²⁰ nuclear reaction. An improvement of the mechanical resistance has been observed at low implantation dose, together with a change of the chemical durability. An expansion of glass has been observed by SEM and interferometric microscopy for 80 keV implantation energy. (10 refs.)

61994 Comparison of heavy-ion, proton and electron irradiation effects in vitreous silica. M.Antonini (Univ., Modena, Modena, Italy), P.Camagni, P.N.Gibson, A.Manara.

Radiat. Eff. (GB), vol.65, no.1-4, p.41-8 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Summarizes recent experiments at the JRC, aiming to determine the relative damage effects produced in a-SiO₂ by particles of different mass and energy, so as to correlate typical defects with specific production mechanisms. By systematic analysis of optical absorption spectra, the main colour centres that are currently associated with primary irradiation effects were characterized. Centres responsible for the B₂-band (5.04 eV) and E'-band (5.78 eV) were quantitatively investigated with respect to particle type, production yield and saturation behaviour. Arguments taken from energy loss and DPA seem to suggest that the E' centre is based on a stable structural substrate, which is not reconciled with simple ideas of a broken bond. The B₂ centre is confirmed to be associated with atomic defects produced by collisions. New determinations in the vacuum UV, performed on heavy-ion irradiated samples, seem to put this centre in quantitative relationship to a centre responsible for a 7.15 eV absorption. (20 refs.)

61995 Annealing studies of irradiation effects in vitreous silica. M.Antonini (Univ. Modena, Modena, Italy), P.Camagni, P.N.Gibson, A.Manara.

Radiat. Eff. (GB), vol.65, no.1-4, p.49-53 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Describes a series of annealing experiments devoted to the study of the thermal behaviour of B₂ and E' centres produced by heavy-ion irradiations in v-SiO₂. Thermal bleaching of the B₂ component is shown to be complete and irreversible at relatively low temperatures ($\leq 500^\circ\text{C}$). On the other hand, bleaching of E' in the same range is reversible and the corresponding absorption band can be entirely recovered in subsequent electron irradiation, suggesting the existence of a stable precursor defect for this centre. By alternating isochronal annealing cycles with electron reirradiations, the annealing of such defects was investigated up to 1000°C, taking care to compare the behaviour of the heavy-ion damaged material with that of undamaged material. The results seem to suggest a structural difference between pre-existing E' precursors of normal SiO₂ and those produced in excess by dis-

placing radiation, the latter being characterized by a distinct process of destruction with an activation energy $Q \geq 0.6$ eV. (11 refs.)

61996 Electron and ion beam effects in amorphous SiO₂ and Si₃N₄ films for electronic devices. R.Hezel (Inst. für Werkstoffwissenschaften VI, Univ. Erlangen, Erlangen, Germany).

Radiat. Eff. (GB), vol.65, no.1-4, p.101-6 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

The effect of electron and ion beam irradiation on the Si₂₃ Auger spectra of SiO₂, Si₃N₄ and Si-oxy-nitride films was measured by the relative intensity of the 92 eV signal, characteristic for the formation of 'free' silicon during irradiation. While in Si-oxy-nitride (O/N=0.37) the beam effects were almost negligible, some damage was found in Si₃N₄, but SiO₂ appeared to be extremely sensitive for electron and ion beam irradiation. By low energy electron loss spectroscopy (ELS) of ion bombarded SiO₂ and Si₃N₄ films new electron states due to broken Si-O and Si-N bonds could be determined within the band energy gap of the insulators. The measured energy losses were interpreted by means of electron energy level schemes of the amorphous films. (13 refs.)

61997 On the registration of low energy (E~1 keV/amu) ion tracks in dielectric minerals. J.Borg, J.C.Dran, Y.Langevin, M.Maurette, J.C.Petit (Lab. Rene-Bernas, Orsay, France).

Radiat. Eff. (GB), vol.65, no.1-4, p.133-7 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Deals with the interaction of low energy (~1 keV/amu), heavy (Z>10) ions with solid state track detectors. Such ions, losing their energy mainly by nuclear collisions, trigger the formation of very short latent tracks of damaged material showing an enhanced chemical reactivity. Indeed, shallow etch pits have been successfully revealed in muscovite mica etched in 40% hydrofluoric acid. The authors have investigated in detail the variations of these etch pit characteristics with various parameters (atomic number Z and energy E of the incident ions, thermal annealing temperature T). (4 refs.)

61998 Thermal stability and chemical reactivity of defects produced in silicates by high energy heavy ions. Y.Langevin (Lab. Rene-Bernas, Orsay, France), J.P.Duraud.

Radiat. Eff. (GB), vol.65, no.1-4, p.139-42 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

The authors study the heavy ion (Au and U) irradiation of labradorite and muscovite. The thermal behavior and chemical reactivity of these tracks show that the latent track is now a continuous cluster of defects, similar to an amorphous phase, along part of the range. From these results, they tentatively assess the relation between energy loss and defect production in silicates. (6 refs.)

61999 Preparation of superinsulating surfaces by the nuclear track technique. B.E.Fischer, D.Albrecht, R.Spöhr (GSI, Darmstadt, Germany).

Radiat. Eff. (GB), vol.65, no.1-4, p.143-4 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

The authors report on the preparation of superinsulated surfaces by heavy ion irradiation and etching. The dependence of the effect on a texture parameter called porosity (=track density \times cross section of an individual etched track channel) has been investigated in a preliminary experiment with 7.5 MeV/u xenon ions on a mica sample. To test the protection against conducting contaminants the resistance (R) of some irradiated and etched samples is compared with that (R₀) of an untreated sample after sputter-coating with 0.7 μm gold. (no refs.)

62000 Formation and relaxation kinetics of mechanical stress in a glass surface layer during ion bombardment. I.I.Daugela, L.I.Prankevicius (A. Snekhus Polytech. Inst., Kaunas, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1306-7 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2123-4 (Oct. 1982). [received: April 1983]

Studies mechanical stresses in K-8 optical glass caused by bombardment by He⁺ and Ar⁺ ions of energy 100 keV. The penetration depth of 100-keV He⁺ ions into the glass was 0.63 μm , considerably greater than the penetration depth 0.08 μm of Ar⁺ ions. The mechanical stresses in the layer are produced because the penetrating ions cause a large number of defects (dislocations, thermal peaks, etc.). Mobile defects may accumulate in the surface layer to form immobile continuous defects or extrude to the surface. The experimental findings indicate that when glass is irradiated with Ar⁺ ions, which give up most of their energy to the atomic nuclei (formation of defects), even small doses 2×10^{15} ion/cm² result in saturation and additional bombardment does not change the velocity of the surface acoustic waves. When bombardment is by light He⁺ ions, which lose much of their kinetic energy in the solid glass as a result of electron deceleration (excitation and ionization of atoms), saturation does not occur even at 10^{16} ion/cm² doses. (5 refs.)

62001 Ion beam induced composition changes during Auger sputter profiling of thin Al films on InP. D.K.Skinner (Allen Clark Res. Centre, Plessey Res. (Caswell), Caswell, Ltd., England), J.G.Swanson, C.V.Haynes.

Surf. & Interface Anal. (GB), vol.5, no.1, p.38-42 (Feb. 1983).

Auger sputter profiles of thin Al films on InP are presented and shown to be susceptible to an unusual type of ion beam induced interfacial distortion. It is found that recoil implantation and atomic mixing produce a differential broadening of the In and P at the interface which can seriously affect the integrity of the Auger profile. Energy shifts in the Al Auger peak indicate that this distortion is associated with AlP formation to a depth dictated by the ion beam energy and species. Experimental requirements for the reduction of interfacial distortion are discussed. The influence of the ion beam on the topography and morphology of the InP surface in relation to interfacial distortion is also considered. (17 refs.)

61.80M Channelling, blocking and energy loss of particles

(see also 29.70 Energy loss and range relations)

- 62002 A one dimensional microscopical model for the study of the coherence in the stopping power problem. III. P.Szilas, G.Sussmann (Theoretische Phys., Univ. Muenchen, Munich, Germany). *Z. Phys. B (Germany)*, vol.50, no.3, p.209-16 (1983). For pt.II see *ibid.*, vol.42, p.253 (1981). The authors consider the quantum mechanical problem of a particle being scattered inelastically by a chain of N infinitely heavy, equidistantly spaced two-level atoms. In a previous paper (Sussmann, G., Szilas, P.: *Z. Phys. B—Condensed Matter* 42, 253, 1981) the time dependent problem of a Gaussian wave packet impinging on the target atoms has been studied and an explicit asymptotic expression for the reduced density matrix ρ_R of the particle has been given. The authors now introduce the coarse grained density matrix $\bar{\rho}_R$. The incoherence $\beta = 1 - \text{Tr}(\bar{\rho}_R^2)$, i.e. the deviation of the state of the particle from a pure state, being small on certain conditions, they find a single particle wave function ψ with $\psi(x,t)\psi^*(x',t) \approx \langle x | \bar{\rho}_R | x' \rangle$ and a nonlinear Hermitean Hamiltonian $H_\psi = p^2/2m + W_\psi$ such that $i\hbar\psi(x,t) = H_\psi\psi(x,t)$ describes the time evolution. Finally the authors also consider W_ψ within the framework of the phenomenological theory of nonlinear frictional operators. (12 refs.)
- 62003 Crystallographic contrast due to primary ion channelling in the scanning ion microscope. P.H.La Marche, R.Levi-Setti, K.Lam (Dept. of Phys., Univ. of Chicago, Chicago, IL, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1240-2 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). The authors observe large crystallographic contrast, in scanning ion micrographs of recrystallized Cu and Si, made by collecting secondary ions or electrons. The contrast is attributed to primary ion-channelling effects. Observed relative secondary ion and electron yields are discussed in relation to the rate of energy loss, calculated for various crystallographic directions. (19 refs.)
- 62004 Nuclear tracks in solids. R.M.Walker (McDonnell Center, Washington Univ., St. Louis, MO, USA). *Radiat. Eff. (GB)*, vol.65, no.1-4, p.131-2 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). A nuclear track is defined as a more or less contiguous set of radiation damage sites that form a linear array defining the trajectory of a charged particle. The author considers better methods to define the atomic nature of tracks prior to etching, a better understanding of the way in which energy transferred to the electronic system results in the displacement of nuclei and a clearer picture of annealing processes. (no refs.)
- 62005 Small angle neutron scattering from oriented latent nuclear tracks. D.Albrecht, P.Armbruster, R.Spohr (GSI, Darmstadt, Germany), M.Roth. *Radiat. Eff. (GB)*, vol.65, no.1-4, p.145-8 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). Parallel arrays of long cylindrical objects with vanishing distance correlation and defined orientation, such as latent nuclear tracks, generated at the heavy ion accelerator facility GSI Darmstadt, represent an almost ideal case for a scattering experiment. A feasibility study has been conducted, using small angle neutron scattering, yielding the following results: 1) In contrast to transmission electron microscopy, the technique is virtually nondestructive and suitable also for low melting point organic materials. 2) Observation times between 0.1 and 1 h were sufficient at the neutron small-angle scattering apparatus D17 at ILL, Grenoble. Latent tracks at areal densities $< 3 \times 10^{11}$ ions per cm^2 could be observed safely below the track interference limit between neighbouring tracks. 3) Small-angle neutron scattering yields intense two-dimensional scattering distributions from which equivalent track radii can be determined. (3 refs.)
- 62006 Experimental determination of the limiting surface-channelling energy. L.L.Balashova, Sh.N.Garin, A.I.Dodonov, E.S.Mashkova, V.A.Molchanov, V.B.Flerov (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.363-4 (July 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.840-4 (July 1982). [received: April 1983] When accelerated particles interact with the surfaces of single crystals, one observes surface-channelling effects, analogous to the channelling effects which occur in the interior of the crystals. Surface-channelling effects can be

observed only if the energy of the transverse motion of the incident particles is not very low (so that the particles can cross the potential barrier created by the surface rows of the crystal). The authors report an experimental determination of this minimum energy. The target was the (100) face of a copper single crystal, on which the close-packed (110) atomic rows form deep semi-channels. The target was bombarded by 30-keV argon ions and 15-keV nitrogen ions. (6 refs.)

- 62007 Density and thermal expansion of liquid U-Nb alloys. W.D.Drotning (Sandia Nat. Labs., Albuquerque, NM, USA). *High Temp.-High Pressures (GB)*, vol.14, no.3, p.253-8 (1982). (10th Plansee Seminar on 'Trends in Refractory Metals, Hardmetals, and Special Materials, and their Technology', Reutte, Austria, 1-5 June 1981). The density and volumetric thermal expansion of U-Nb alloys were measured in the liquid phase by gamma densitometry. Compositions varied from 0 to 25 wt.% Nb, and data were obtained over a temperature range of 200-300K above the liquidus temperature for each of the six alloys. The density of each molten alloy was found to vary linearly with temperature. For pure uranium, the density in the liquid phase is given by $\rho/\text{g cm}^{-3} = 16.95 - 12.9 \times 10^{-7} [(T/\text{K}) - 1407]$. The liquid density at the liquidus temperature was found to vary smoothly with alloy composition. From the liquid density and thermal expansion data, the molar volume was calculated for each alloy. For intermediate compositions, the data indicate a volume expansion, typified by an excess molar volume of approximately 4% at 2000K for alloys near 40 at.% Nb. Experimental measurements at high temperature were also made of the solid phase linear thermal expansion for pure uranium and for the 10 and 15 wt.% Nb materials. (9 refs.)

- 62008 Computation of normal modes from identified complex modes. S.R.Ibrahim (Old Dominion Univ., Norfolk, VA, USA). *AIAA J. (USA)*, vol.21, no.3, p.446-51 (March 1983). A technique is presented to compute a set of normal modes from a set of measured (damped) complex modes. The number of elements in the modal vectors, which is equal to the number of measurements, can be larger than the number of modes under consideration. It is also shown in this paper that the practice of normal mode approximation to complex modes can lead to considerably large errors when the modes are too complex. A numerical example and a simulated experiment are presented to illustrate the concepts discussed and to support the theory presented. (18 refs.)
- 62009 Optimization of the computation of elastic constants from the measurements of ultrasonic velocities. B.Hosten, B.Castagnede (Lab. de Mecanique Phys., Univ. de Bordeaux-I, Talence, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.5, p.297-300 (7 Feb. 1983). In French. An optimized process is proposed for the mechanical characterization of anisotropic materials by means of an ultrasonic method. Newton's method is adapted to a specific problem of optimization of the stiffness matrix coefficients. (4 refs.)

62010 Elastic properties of CsCN. A.Loidl (Inst. für Phys., Univ. Mainz, Mainz, Germany), S.Haussuhl, J.K.Kjems, *Z. Phys. B (Germany)*, vol.50, no.3, p.187-92 (1983).

The temperature dependence of the elastic constants of CsCN exhibiting the CsCl structure was measured with ultrasonic and neutron techniques. The room temperature values were found to be $c_{11}=18.8$, $c_{12}=10.7$ and $c_{44}=2.95 \times 10^{10}$ dyn/cm². The sound waves in T_{2g} and E_g symmetries exhibit anomalous temperature effects which are similar but definitively weaker than those in the NaCl type cyanides. In addition the authors measured the acoustic phonon dispersion along [100] and [110]. These results are compared with recent molecular dynamics calculations. (28 refs.)

62011 Elasticity moduli of TGS crystals for cylindrical samples. H.Wolniewicz (Inst. of Phys., Tech. Univ. of Wrocław, Wrocław, Poland). *Mater. Sci. (Poland)*, vol.7, no.4, p.475-9 (1981).

Elasticity moduli for triglycine sulphate (TGS) were determined by the electric resonance method. Resonance frequencies were estimated as a function of the sample diameters. Evaluation of the accuracy of results obtained indicates the most favourable diameters of the sample for which reasonable values of elasticity moduli are obtained. (8 refs.)

62012 On the elastic anisotropy of ferroelectric triglycine selenate. S.K.Khanna (Dept. of Phys., Indian Inst. of Technol., Madras, India). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.173-8 (1 March 1983).

The numerical values of the elastic constants C_{11} , C_{22} , C_{33} , C_{15} , C_{35} , C_{55} are determined experimentally by using an acousto-optical method. Results are reported of the anisotropy of the velocity of 10 MHz ultrasonic waves in the direct vicinity of the phase transition temperature. It is observed that in the ferroelectric phase the velocity rises with a rotation of the sound wave vector by 2 to 4° with respect to the z-axis in the Y-Z plane. On the other hand these critical anomalies of velocity are found to follow an identical logarithmic behaviour in the paraelectric phase. The results are discussed on the basis of Landau theory but at the same time taking into account the long range dipole-dipole interactions as well as the fluctuations of the order parameter. The correlation parameter is estimated from the temperature dependence of the elastic coefficient in the paraelectric phase ($\delta=0.2 \times 10^{-16}$ cm²). (12 refs.)

62013 Coincidence of bounds for some elastic moduli of polycrystals with [100] fibre texture. C.M.Sayers (Materials Phys. Div., AERE, Harwell, England). *Philos. Mag. A (GB)*, vol.47, no.3, p.L1-4 (March 1983).

Kroner and Wawra (1978) have demonstrated that the Voigt and Reuss bounds for the elastic constants C_{13} , C_{33} and C_{44} of a polycrystalline aggregate of cubic crystallites with [100] fibre texture coincide. In this paper it is shown in addition that the quantity $C_{11}+C_{12}$ has the same value in the Voigt and Reuss schemes, and that the difference in $C_{66}=(C_{11}-C_{12})/2$ varies with the square of the anisotropy factor $C=(C_{11}-C_{12}-2C_{44})$ of the crystallites from which the aggregate is composed for small anisotropy C . Expressions for the elastic stiffness and compliance constants in the Voigt and Reuss schemes are given which correct those recently given by Ledbetter (1982). (12 refs.)

62014 On the work hardening rate of glassy polymers. I. Application to the physical ageing of atactic PMMA. C.Bultel, J.M.Lefebvre, B.Escaig (Lab. des Structures et Propriétés de l'Etat Solide, Univ. des Sci. et Tech. de Lille, Villeneuve d'Ascq, France). *Polymer (GB)*, vol.24, no.4, p.476-80 (April 1983).

The authors introduce a new parameter to characterize the non-elastic behaviour of glassy polymers, namely the work hardening rate. The change in molecular microstructure induced by nonelastic deformation during the pre-yield stage is treated as a defect nucleation rate. Such defect nucleation is very sensitive to the past thermomechanical history of the material and therefore the parameter K , which characterizes the ability of the polymer to deform non-elastically, will be influenced by any structural variation. Application to physical ageing of atactic poly(methylmethacrylate) PMMA is presented. (13 refs.)

62015 Strain-ageing in silver chloride. I. The representative curve. H.Shalitt, M.T.Sprackling (Phys. Dept., Queen Elizabeth Coll., London, England). *Philos. Mag. A (GB)*, vol.47, no.3, p.331-42 (March 1983).

A study has been made of strain-ageing at room temperature in zone-refined silver chloride. It is found that if the yield stress after ageing is measured on a single specimen for a sequence of ever-increasing ageing times, the graph of change of flow stress against \ln (ageing time) is a reproducible curve that reflects the various mechanisms that operate during ageing, and has been called the representative curve. The representative curve for silver chloride at room temperature has four distinct regions which are interpreted in terms of the dislocation-point-defect interactions taking place in the material. (27 refs.)

62016 The low-temperature flow stress of europium-doped sodium chloride. B.Subramanian, J.J.Martin (Dept. of Phys., Oklahoma State Univ., Stillwater, OK, USA). *Philos. Mag. A (GB)*, vol.47, no.3, p.343-9 (March 1983).

The flow stress of single-crystal NaCl:Eu has been measured as a function of europium concentration and heat treatment at 80, 196, 273 and 300K. Samples that were fast-cooled from temperatures above 673K contain isolated Eu^{2+} -Na vacancy (IV) dipoles. These samples are considerably softer than samples which had been aged at 423K for 24 hours. The aged samples contain an aggregated phase. A linear dependence of flow stress on concentration was observed at all temperatures for the fast-cooled samples. At 80K the curve of the flow stress versus concentration had a line gradient approximately twice the value observed at the higher temperatures. If this linear dependence is caused by a Snoek-relaxation of the isolated IV dipoles, their relaxation time must be considerably modified by the presence of the moving dislocations. The aged samples showed a square-root dependence of flow stress on concentration for temperatures above 196K. (21 refs.)

62017 Orientation dependence of slip deformation of the conjugate system in Cu-6 at.% Al single crystals. T.Mori, H.Fujita (Dept. of Materials Sci. & Engng., Osaka Univ., Yamada-oka, Suita, Japan). *Philos. Mag. A (GB)*, vol.47, no.3, p.435-40 (March 1983).

The orientation dependence of slip deformation of the conjugate system has been examined in cylindrical Cu=6 at.% Al single crystals. The threshold stress of conjugate slip, which occurs abruptly in the later stages of deformation, is high when the crystal axis is near (111), but becomes lower as the axis approaches (100). Furthermore, as the initial axis is far away from the symmetry line of (100)-(111), the threshold stress becomes higher. This orientation dependence is just the reverse of that appropriate to twinning deformation. It is concluded that twinning and conjugate slip deformations are interdependent stress-relief mechanisms. (13 refs.)

62018 Impurity-induced weakening of materials. B.V.Petukhov (Inst. of Crystallography, Acad. of Sci., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.360-1 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.833-6 (July 1982).

[received: April 1983]
The authors derive a theory for the impurity induced weakening of materials. They consider the dislocation motion in plastic deformation and the effect of an impurity on the probability for thermally activated production of solitons. (8 refs.)

62019 Fatigue life estimation using simple fracture mechanics. F.Sherratt (Univ. of Warwick, Warwick, England). *J. Soc. Environ. Eng. (GB)*, vol.22, no.1, iss.96, p.23-7, 35 (March 1983). Methods of using linear elastic fracture mechanics (LEFM) in static design are first dealt with. Various expressions for fatigue crack growth are presented and fracture mechanics in cumulative damage is then considered. (5 refs.)

62020 Correlation between grain-boundary hardening and grain-boundary energy in niobium bicrystals. Y.T.Chou, B.C.Cai, A.D.Romig, Jr., L.S.Lin (Dept. of Metall. & Materials Engng., Lehigh Univ., Bethlehem, PA, USA). *Philos. Mag. A (GB)*, vol.47, no.3, p.363-8 (March 1983). Grain-boundary hardening of oriented niobium bicrystals with symmetric tilt boundaries has been determined using microhardness measurements. The boundary hardening was found to be misorientation-dependent and related to the boundary energy. For bicrystals with low-angle boundaries, the hardening varies with misorientation with a linear relationship of the Read-Shockley type. For bicrystals with high-angle boundaries, hardening cusps (minima) were observed near the coincidence-site-lattice boundaries. (13 refs.)

62021 Wear resistance of friction elements working in oil. V.S.Fantalov, V.M.Zhuchkov, E.G.Yudin. *Izv. VUZ Mashinost.* (USSR), no.12, p.59-62 (1982). In Russian. The general form of the relationships between the wear of metal-ceramic discs, working in oil and paired with steel discs, is investigated as a function of parameters of the slipping process, using postulates from the molecular-mechanical theory of friction. Values of unknown coefficients, entering the equations derived, have been found using the results of experimental investigations, for a wide range of parameter changes in the disc slipping process. The dependence obtained can be applied to estimating the lifetime of units working in oil under friction. The metal-ceramic discs described are used in transmissions of transport machines. (2 refs.) Z.F.V.

62022 A new model for the erosion of metals at normal incidence. G.Sundararajan, P.G.Shewmon (Dept. of Metall. Engng., Ohio State Univ., Columbus, OH, USA). *Wear* (Switzerland), vol.84, no.2, p.237-58 (15 Jan. 1983). A new theoretical model is proposed for the erosion of metals by particles at normal incidence. The model employs a criterion of critical plastic strain to determine when the material will be removed. This critical plastic strain is defined as the strain at which the deformation in the target localizes and hence results in the lip formation. It is shown that, under typical erosion conditions, the 'localization' model is more appropriate than the 'fatigue' models. Finally, it is demonstrated that the new model predicts quite well all the essential features of the normal impact erosion process. (34 refs.)

62023 Elastic wave propagation in solids in relation to acoustic emission. H.F.Pollard (School of Phys., Univ. of New South Wales, Kensington, NSW, Australia). *Met. Forum* (Australia), vol.5, no.3, p.158-66 (Winter 1982). Three-dimensional wave propagation in large solids, both isotropic and anisotropic, are discussed, together with the effects produced by surfaces and the formation of waveguide modes in finite solids. Some causes of wave energy loss are briefly treated, and a final section dealing with the problem of acoustic emission source identification is included. (12 refs.)

62024 Brewster reflections of elastic waves in hexagonal crystals. V.N.Lyubimov, V.I.Ai'shits (L.Ya. Karov Sci.-Res. Physicochem. Inst., Acad. of Sci., USSR). *Sov. Phys.-Crystallogr.* (USA), vol.27, no.5, p.512-16 (Sept.-Oct. 1982). Translation of: *Kristallografiya* (USSR), vol.27, no.5, p.851-8 (Sept.-Oct. 1982). [received: April 1983]

The authors describe two types of Brewster reflection of elastic waves in hexagonal crystals. They discuss the case in which the surface is parallel to the hexad symmetry axis and the plane of incidence is rotated through a small angle α relative to the plane of transverse isotropy. They establish the conditions which must be obeyed by the elastic constants if these reflections are to arise. The first type of Brewster reflections can arise if $\alpha=0$ (analogous reflections occur in isotropic bodies); when $\alpha=0$ there can be two such reflections, but when $\alpha \neq 0$ either both of them or only one of them (accord-

ing to the values of the elastic constants of the crystal) may split into two different Brewster reflections. The reflections existing when $\alpha=0$ may be isolated, but when $\alpha \neq 0$ they may be converted to leaky (or counter-leaky) waves. The second type of Brewster reflections arises from the transverse body wave which is propagated along the surface when $\alpha=0$, satisfying the boundary conditions. When $\alpha \neq 0$ this wave can give rise to two different Brewster reflections which have no analogue in an isotropic body. The maximum number of Brewster reflections of both types is six when $\alpha \neq 0$. A case is also possible in which there is no Brewster reflection either in the plane of transverse isotropy ($\alpha=0$) or in its vicinity ($\alpha \neq 0$). (13 refs.)

62025 Irreversible double refraction of elastic waves in crystals with magnetic structure and spatial dispersion. V.N.Belyi (Inst. of Phys., Acad. of Sci., Belorussian SSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.516-18 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.859-62 (Sept.-Oct. 1982). [received: April 1983]

The author generalizes the coupling equation of the linear theory of elasticity for crystals with magnetic structure and spatial dispersion. He shows that in such media there is irreversible double refraction, consisting in a difference between the velocities of propagation of elastic waves for opposite wave-normal directions. He discusses the reflection of elastic shear waves from a plane-parallel layer. He shows that the polarization characteristics of the reflected wave depend on the Faraday rotation of the plane of polarization and the irreversibility parameter. (9 refs.)

(see also 81.40J Elasticity and anelasticity)

62026 Hydrogen relaxation in lutetium. P.Vajda, J.N.Daou (CNRS, Univ. de Paris-Sud, Orsay, France), P.Moser.

J. Phys. (France), vol.44, no.4, p.543-51 (April 1983).

The internal friction and the dynamic modulus have been measured between 4.2 and 470K in the system α -LuH(D)_x, with $x=0$ to 0.2. In well annealed specimens an (H)-peak is observed at 215-225K, which has a linearly x-dependent amplitude and exhibits an isotope effect on its activation energy and relaxation time. It is attributed to a Snoek-like relaxation of H-H pairs reorienting in the Lu-lattice. The isotope effect is interpreted in a model of tunnelling from different excited levels for LuH_x and LuD_x. Deformation introduces a (d-H)-peak at 250-260K in H(D)-containing samples only, also exhibiting an isotope effect; it is attributed to a Snoek-Koster type relaxation of H(D) trapped on dislocations. Two (d_{1,2})-peaks at 160 and 215K, which occur in the pure metal only, and a (d)-peak centred near 350K in all deformed specimens are ascribed to geometrical kink migration and to double-kink generation on a screw dislocation network, respectively. 62.50 HIGH-PRESSURE AND SHOCK-WAVE EFFECTS IN SOLIDS

62027 Random walk of dislocations following a high-velocity impact. B.J.West, M.F.Shlesinger (Center for Studies of Nonlinear Dynamics, La Jolla Inst., La Jolla, CA, USA).

J. Stat. Phys. (USA), vol.30, no.2, p.527-35 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

The permanent distortion of an elastic material due to a shock wave generated by a high-velocity impact is modeled by a random walk of dislocations. The dislocation movement is inhibited by a spatial and energetic distribution of activation barriers. The dislocations also experience a radially outward stress bias from the point of impact. The experimentally observed scaling of the total integrated momentum as well as the scaling with time of the penetration distance and strength of the shock wave are obtained in this model. (11 refs.)

62028 Effect of initial conditions on the evolution of a laser-generated shock wave. F.Cottet, J.P.Romain (Lab. d'Energetique et Detonique, ENSMA, Poitiers, France).

J. Phys. Lett. (France), vol.44, no.7, p.L235-40 (1 April 1983). In French. The evolution of a high amplitude laser-generated shock in a solid target is described by the use of a hydrodynamic model. In comparison with a previous model, this one takes into account the front face target propagation due to the ablation pressure effect. This model is also used to study the initial pressure profile effect on the shock wave decay. (10 refs.)

(see also 62.80 Ultrasonic relaxation; for sound propagation, see 43.; for second sound in quantum fluids, see 67.40, 67.50 and 67.60)

62029 Sound speeds and isentropic compressibilities of 1,1,2,2-tetrachloroethane with alcohols. N.V.Choudary, J.C.Mouli, P.R.Naidu (Chem. Labs., Sri Venkateswara Univ., Tirupati, India).

Acoust. Lett. (GB), vol.6, no.4, p.56-61 (Oct. 1982). [received: March 1983]

New experimental data for sound velocity in binary mixtures of 1,1,2,2-tetrachloroethane with 1-propanol, 1-butanol, 1-pentanol, 1-hexanol, heptanol and 1-octanol were collected at 303.15K. The results have been analysed in terms of free-length theory and collision factor theory. The analyses showed that the former theory gives a better estimate of sound speed in the six mixtures than the latter. The sound speed data were also used to compute isentropic compressibilities. The deviation in isentropic compressibility suggests that the effects of interactions between like and unlike molecules balance each other to varying degrees in the mixtures. (17 refs.)

62030 Dynamic features of the aminopolycarboxylate complexes in aqueous solutions studied by the ultrasonic absorption method. Y.Funaki.

J. Sci. Hiroshima Univ. A (Japan), vol.46, no.2, p.253-66 (Jan. 1983).

Ultrasonic absorption was measured in aqueous solutions of ethylenediaminetetraacetate (EDTA) and trans-1,2-cyclohexanediaminetetraacetate (CyDTA) complexes of various divalent and trivalent metal ions. Relaxation absorption was observed only for the labile complexes, i.e. Ca, Sr, Ba, Co(II), Zn, Cd, La, Ce and Nd complexes. From the pH and concentration dependence of the relaxation parameters, the absorption was ascribed to the equilibrium of pentadentate form=hexadentate form of the coordinated ligand. It was clarified that the rate-determining step of the formation of the hexadentate form is the loss of water from the central metal ion. The rate and the stability constants and the volume change of the reaction were obtained. The effects of the structure of ligand and the charge of metal ion on the above equilibrium were studied by comparing the results of divalent metal-CyDTA and lanthanide-EDTA systems with those of divalent metal-EDTA systems. (23 refs.)

62031 Pressure effects and ultrasonic attenuation in the binary liquid mixture 3-methylpentane and nitroethane near the critical point. E.A.Clerke, J.V.Sengers, R.A.Ferrell, J.K.Bhattacharjee (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2140-51 (April 1983).

Experiments are reported in which a critical mixture of 3-methylpentane plus nitroethane has been subjected to varying pressures. By varying the static pressure the authors have determined the dependence of the critical temperature on pressure with considerable accuracy. By sudden depressurization they have cooled the sample adiabatically leading to phase separation via spinodal decomposition; from these experiments they have determined the adiabatic thermal pressure coefficient near the critical point. By combining the data with the experimental density data of Greer and Hocken (1973) the authors are able to determine the asymptotic critical behaviour of the thermal-expansion coefficient and of the specific heat, consistent with two-scale-factor universality. They also obtain a value for the adiabatic coupling constant which appears in the dynamic scaling theory for the frequency dependence of the critical sound attenuation. The thermodynamic data appear to be in good agreement with the critical ultrasonic attenuation data obtained by Ishida and Harada (1980) for 3-methylpentane plus nitroethane. (46 refs.)

62032 Wave propagation in a solid propellant. C.Dumont (Lab. de Mecanique des Solides, Ecole Polytech., Palaiseau, France).

Rev. Acoust. (France), vol.15, no.63, p.242-5 (1982). In French.

With a comparative method using an FFT (fast Fourier transform), the 1-dimensional propagation of short pulses in propellants is studied. Two experimental techniques for both emission and reception are used to scan two frequency bands. Phase velocity and attenuation curves are shown for low and high frequencies in various conditions of temperature and confining pressure. The technique using piezoelectric transducers is the most convenient one. (8 refs.)

62033 Effect of the Bragg and deformation-potential forces on ultrasonic propagation in metals. G.Feyder (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA), E.Kartheuser, L.R.Ram Mohan, S.Rodriguez.

Phys. Rev. B (USA), vol.27, no.6, p.3213-20 (15 March 1983).

A study is given of the effect of the Bragg and deformation reaction forces on acoustic propagation in simple metals. The authors show that no significant alterations of the results obtained within the free-electron model are expected and that no change occurs in the position and strength of the helicon-phonon interaction. (11 refs.)

62.90 OTHER TOPICS IN MECHANICAL AND ACOUSTICAL PROPERTIES OF CONDENSED MATTER

- 62035 Topological limitations of effective-medium approximations in fluid-solid systems having two longitudinal-acoustic modes. P.N.Sea, D.L.Johnson (Schlumberger-Doll Res. Center, Ridgefield, CT, USA). *Phys. Rev. B (USA)*, vol.27, no.6, p.3133-7 (15 March 1983). Considers the acoustic properties of two-component composites. The authors show that in order for the system to have two distinct nondispersive longitudinal modes, one component must be a fluid, the other must be a solid, and each component must be part of an infinite, percolating cluster. Although the Biot theory is able to describe these modes, effective-medium theories, within the single-site approximation, cannot predict them precisely because some or all of the constituents are taken as unconnected inclusions. In the special case in which the solid constituent occurs as isolated particles within the fluid (a suspension) there is only one longitudinal mode and the Biot theory and the average- t -matrix approximation are in essential agreement with each other and with experiments in predicting its speed. (17 refs.)

63.00 LATTICE DYNAMICS AND CRYSTAL STATISTICS

(see also 05.50 Lattice theory, 65. Thermal properties, 66.70 Thermal conduction, 68.30 Dynamics of surface and interface vibrations, 78.30 Infrared and Raman spectra)

63.10 GENERAL THEORY

- 62036 Propagation of acoustic and optical solitons in nonlinear diatomic chains. St.Pnevmatikos, M.Refnissenet (Lab. d'Optique du Réseau Cristallin, Univ. de Dijon, Dijon, France), N.Flytzanis. *J. Phys. C (GB)*, vol.16, no.11, p.L305-10 (20 April 1983). The authors present an analytic and numerical study of a nonlinear diatomic chain with a quartic interaction potential between nearest neighbours. In the continuum approximation using scaling arguments and a decoupling ansatz for the motion of the two different masses they find 'acoustic' pulse type excitations which obey a modified Boussinesq equation and 'optical' envelope type solitary solutions of a nonlinear Schrödinger equation. Computer simulations on their propagation and interaction show these excitations to be long lived. (16 refs.)

63.20 PHONONS AND VIBRATIONS IN CRYSTAL LATTICES

- 62037 Comparative reinvestigation of the interaction of phonons with Wannier and Frenkel excitations in crystalline solids. J.Singh (Res. School of Chem., Australian Nat. Univ., Canberra, Australia). *Chem. Phys. (Netherlands)*, vol.75, no.3, p.371-7 (15 March 1983). The interaction of lattice vibrations with excitons in inorganic and organic semiconductors/insulators is reinvestigated. These results expose the comparative nature of exciton-phonon interaction in the two types of solids and produce two new coupling functions useful for Frenkel exciton-phonon interaction. (17 refs.)
- 62038 Lattice instability in one-dimensional molecular-type crystals. D.Feinberg, J.Ranninger (Groupe des Transitions de Phases, CNRS, Grenoble, France). *J. Phys. C (GB)*, vol.16, no.10, p.1875-85 (10 April 1983). The authors study crystalline systems which as far as the electrons are concerned behave like composites of diatomic molecules loosely coupled together. The electrons are in molecular states which weakly overlap between neighbouring molecular sites. They examine a linear chain of such molecules which are oriented orthogonally to the chain direction. They show that such a system is unstable under a deformation consisting in squeezing the diatomic molecules orthogonally to the chain direction in some periodic fashion along the chain direction. (10 refs.)
- 62039 Analysis of translation-rotation coupling in an orientationally disordered ionic crystal. R.M.Lynden-Bell (Dept. of Theoretical Chem., Univ. of Cambridge, Cambridge, England), I.R.McDonald, M.L.Klein. *Mol. Phys. (GB)*, vol.48, no.5, p.1093-117 (10 April 1983). Molecular dynamics calculations are used to study the coupling between translations and rotations in a model appropriate to solid sodium cyanide in its orientationally disordered high temperature cubic phase. Static properties are analysed via the formalism of Michel and Naudts (1978) through the introduction of a wavevector dependent parameter λ which measures the extent of translation-rotation coupling. The dynamics of the crystal are shown to be described accurately by a Mori-type theory, similar to that adopted by de Raedt and Michel (1980) in which collective time correlation functions are expressed in terms of λ and certain other static averages. The same approach is used to discuss the crystal dynamics in the region of long wavelength, where the molecular dynamics calculations yield no direct information. (35 refs.)

- 62040 Spin-phonon interactions in the Ising model with a transverse field. J.M.Wesselinowa (Dept. of Phys., Univ. of Sofia, Sofia, Bulgaria). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.71-82 (1 March 1983). A Green function technique is used to study the effects of spin-phonon interactions in the Ising model with a transverse field. The renormalized energy of the coupled mode, the damping of the spin waves, and the phonon damping are evaluated. The transverse dynamic structure factor exhibits three peaks due to the coupling of the transverse soft-mode and the acoustic phonon mode. The width of the central peak is proportional to the phonon damping. (30 refs.)
- 62041 Effect of three-body forces on thermophysical and anharmonic properties of rare gas solid mixtures. R.K.Singh, D.K.Neb, S.P.Sanyal (Dept. of Postgraduate Studies & Res. in Phys., Univ. of Jabalpur, Jabalpur, India). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.289-97 (1 March 1983). The effects of three-body forces on the thermophysical and anharmonic properties of rare gas solid (RGS) mixtures are investigated using the virtual crystal approximation and an interatomic potential consisting of the long-range van der Waals dipole dipole interaction and three-body forces, the short-range Born-Mayer type overlap repulsion, and the zero-point energy. The agreement between experimental and the authors' theoretical results of various properties of the host RGS is, generally, better than obtained by most earlier workers. The results on RGS mixtures follow systematic trends identical to those of diatomic solid mixtures but reliance in them will be deferred until the report of the corresponding measured data. (45 refs.)
- 62042 Sound emission by bubbles. A.V.Vershinin, A.L.Sukstanskii. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.3, p.418-22 (March 1983). In Russian. A study has been made for interaction of a stationary-moving bubble with elastic lattice vibration (phonons). The latter are estimated for emission intensity and an extra slowing-down force acting upon the bubble and arising due to the interaction is discussed. The force is shown to be maximum at the bubble rate equal to the sound velocity. Sound emission by the bubble vibrating under the effect of an external magnetic field is considered. Sound intensity values are estimated for a case of solitary bubble vibrations and bubble lattice vibrations. A diagram of the generated sound directness is plotted for the case of lattice vibrations. (4 refs.)

63.20D Phonon states and bands, normal modes, and phonon dispersion

- 62043 Phonon spectrum and Debye Waller-factors of niobium carbide (NbC). R.B.Yadav (Dept. of Phys., S.D.P.G. Coll., Muzaffarnagar, India). *Physica B & C (Netherlands)*, vol.115 B+C, no.2, p.233-6 (Jan. 1983). A consistent and comprehensive approach has been adopted to derive the framework of a deformation dipole model (DDM) which is capable of explaining successfully the lattice dynamics of ionic crystals. The application of this model to the case of niobium carbide crystal has reproduced fairly well the phonon dispersion and Debye-Waller factors. (9 refs.)
- 62044 Special features of vibrational properties of mixed crystals with TiSe structure. N.M.Gasany, A.S.Ragimov (Dept. of Phys., Azerbaijan State Univ., Baku, Azerbaijan SSR), A.F.Goncharov, N.N.Melnik, E.A.Vinogradov. *Physica B & C (Netherlands)*, vol.115 B+C, no.3, p.381-94 (March 1983). Polarized IR reflection and Raman scattering spectra have been studied in solid solutions based on TiSe structural type chain single crystals ($\text{TiS}_{1-x}\text{Se}_x$, $\text{TiGa}_{1-x}\text{Te}_x$ and $\text{TiIn}(\text{Se}_{1-x}\text{Te}_x)_2$). The results of processing the IR spectra of mixed crystals are analyzed from the standpoint of a random-element-isodisplacements (REI) model extended to the case of many oscillators. In the case of the formation of mixed cells in solid solutions, respective modes have been observed in IR reflection and Raman scattering spectra. (32 refs.)
- 62045 Lattice dynamics of α -quartz including the effect of the width of the atomic electron distribution. K.Iishi (Dept. of Mineralogical Sci. & Geology, Yamaguchi Univ., Yamaguchi, Japan), M.Miura, Y.Shiro, H.Murata. *Phys. & Chem. Miner. (Germany)*, vol.9, no.2, p.61-6 (1983). On the basis of the polarizable-ion model (PIM) the effect of the width of the atomic electron distribution on the lattice dynamics of α -quartz was taken into account using the Birman method. The frequencies of optical modes, elastic constants and piezoelectric constants were reproduced using the parameters of this model (an effective charge z , a width parameter w , an electronic polarizability α , and force constants). The width parameter of the oxygen atom was found to be about 0.59 Å, and the effective charge of the silicon atom 1.42 electron charges. (24 refs.)
- 62046 Lattice dynamics of FCC Ca. C.Stassis, J.Zaretsky, D.K.Misemer, H.L.Skriver, B.N.Harmon (Dept. of Phys., Iowa State Univ., Ames, IA, USA), R.M.Nicklow. *Phys. Rev. B (USA)*, vol.27, no.6, p.3303-7 (15 March 1983). A large single crystal of FCC Ca was grown and was used to study the lattice dynamics of this divalent metal by coherent inelastic neutron scattering. The phonon dispersion curves were measured, at room temperature, along the $\{000\}$, $\{\bar{1}\bar{1}0\}$, $\{\bar{1}\bar{1}\bar{1}\}$, and $\{0\bar{1}\bar{1}\}$ symmetry directions. The dispersion curves bear a striking resemblance to those of FCC Yb, which is also a divalent metal with an electronic band structure similar to that of Ca. In particular, the shear moduli c_{44} and $(c_{11}-c_{12})/2$ differ by a factor of 3.4, which implies that FCC Ca (like FCC Yb) is very anisotropic with regard to the propagation of elastic waves. The frequencies of the $T_1[\bar{1}\bar{1}0]$ branch for $\bar{1}$ between approximately 0.5 and 0.8 are slightly above the velocity-of-sound line determined from the low-frequency measurements. Since a similar effect has been observed in FCC Yb, it is natural to assume that the anomalous dispersion exhibited by the $T_1[\bar{1}\bar{1}0]$ branches of these metals is due to an electronic effect. To provide further support for this assumption the authors have performed a band theoretical calculation of the generalized susceptibility $\chi(\bar{q})$

of FCC Ca. The results suggest that, for ξ between approximately 0.6 and 0.8, there is a relative decrease in the electronic screening of the vibrational motion of the nuclei, which may account for the positive dispersion exhibited by the $T_1[\xi\theta]$ branch in this range of ξ values. The data were used to evaluate the elastic constants, the phonon density of states, and the lattice specific heat of FCC Ca. (22 refs.)

63.20P Localized modes

- 62047 Localized mode energies and hydrogen potential in refractory metals. D.Richter (Inst. fur Festkörperforschung, KFA Jülich, Jülich, Germany). *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.293-306 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982). Recent experimental results on local vibrations of hydrogen atoms in niobium and tantalum are reviewed. First, high resolution measurements of pure Nb-H(D,T) and Ta-H(D) systems where well-defined second harmonics have been resolved are examined and interpreted in terms of a weakly anharmonic potential common to all hydrogen isotopes. Secondly, the first observations by spectroscopic methods of the trapping of hydrogen atoms in niobium are surveyed. The measurements revealed detailed microscopic information, e.g. on the symmetry of the trapping sites and their degree of disturbance. Interstitial oxygen and nitrogen impurities as well as substitutional titanium were found to be strong traps which suppressed the precipitation of hydride phases at low temperature, whereas in the case of vanadium the easily recognizable vibrational pattern of ordered hydride phases were observed. 63.70 STATISTICAL MECHANICS OF LATTICE VIBRATIONS

(see also 65. Thermal properties of condensed matter, 66.70 Thermal conduction)

- 62048 A quantitative systematization of hydrogen-induced changes in Debye temperatures of metals. I.Jacob (Dept. of Nuclear Engng., Ben Gurion Univ. of the Negev, Beer-Sheva, Israel). *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.309-16 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982). Nuclear resonance scattering of γ -rays has recently been used to obtain information on the Debye temperatures θ_D of metal hydrides. In particular the contribution of nickel to the θ_D of Mg_2Ni , LaNi_2 and their hydrides was estimated. It was assumed that the different behaviour of θ_D for nickel in the two cases (i.e. an increase upon hydrogenation in Mg_2Ni and no change in LaNi_2) could be related to the different stabilities of the two hydrides. Consequently an empirical relationship connecting the Debye temperatures θ_M and θ_H of a metal and its hydride respectively with the heat ΔH_f of formation of the hydride was derived. It appeared, however, that two ambiguous calculating procedures were used to derive the θ_H values. One of these procedures was used consistently in the present work for all the metal-hydrogen systems and the original phenomenological rule was changed accordingly. The qualitative theoretical considerations preceding the derivation of the empirical relation are briefly presented. Some experimental data are discussed in terms of the proposed empirical rule. In particular, the obvious exceptions associated with the group IVa metal hydrides TiH_x and ZrH_x are attributed to the Jahn-Teller effect in these systems. (40 refs.)
62049 New model for thermal effects in photoelectron spectroscopy. H.Martensson (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden). *Phys. Rev. B (USA)*, vol.27, no.7, p.4492-4 (1 April 1983). A new model is proposed to explain recently observed anomalous Debye-Waller factors in photoelectron spectra from Cu (110). The d -bands are described by a tight-binding formalism, and their response to thermal vibrations is found to be strongly dependent of k -space location. (6 refs.)
62050 The Debye-Waller factor in quasi-one-dimensional and quasi-two-dimensional crystals. M.A.Krivoglaz, A.V.Min'kov (Inst. of Metal Phys., Acad. of Sci., Ukrainian SSR). *Sov. Phys.-Crystallogr. (USA)*, vol.27, no.5, p.503-6 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.837-42 (Sept.-Oct. 1982). [received: April 1983]
The authors make an analytical calculation of the Debye-Waller factor $\exp(-2M_2)$ in chain and layer crystals. They take account of the spatial dispersion, which influences the vibration spectra in these crystals. They investigate

the dependence of $2M_2$ and of the corresponding effective Debye temperatures θ on the temperature, the direction of the diffraction vector Q , and the parameters $\epsilon \ll 1$ characterizing the elastic anisotropy. They find that $2M_2$ depends markedly on the direction of Q . The linear temperature dependence of $2M_2$ extends into the region of low temperatures well below θ . At very low temperatures the effective Debye temperature strongly depends on T and becomes considerably higher than at high temperatures. (8 refs.)

64.10 GENERAL THEORY OF EQUATIONS OF STATE AND PHASE EQUILIBRIA

- 62051 Calculation and prediction of fluid phase equilibria from an equation of state. U.K.Deiters (Dept. of Chem., Univ. of Bochum, Bochum, Germany). *Fluid Phase Equilibria (Netherlands)*, vol.10, no.2-3, p.173-82 (March 1983). (Supercritical Fluids. Their Chemistry and Application, Cambridge, England, 13-15 Sept. 1982). Liquids or compressed gases consisting of light molecules show deviations from classical mechanics, which are caused by the discontinuity of energy levels. From the assumption that each molecule is confined to a cell with a size depending on the free volume, a quantum correction is derived which extends any van der Waals type equation of state to quantum gases. The correction is applied to a semiempirical equation of state developed by the author. The extended equation yields reasonable critical compressibility factors and gives a better representation of PVT data than the uncorrected equation. Furthermore high pressure phase equilibria in mixtures containing helium and hydrogen have been calculated. Again the agreement with experimental data is improved; the adjustable binary interaction parameters have values close to the Berthelot-Lorentz rules and are less temperature dependent. (11 refs.)
62052 Thermodynamic calculation of supercritical-fluid equilibria: New mixing rules for equations of state. K.W.Won (Process Methods & Data, Advanced Technol. Div., Fluor Engrs. Inc., Irvine, CA, USA). *Fluid Phase Equilibria (Netherlands)*, vol.10, no.2-3, p.191-210 (March 1983). (Supercritical Fluids. Their Chemistry and Application, Cambridge, England, 13-15 Sept. 1982). Simple cubic equations of state with conventional mixing rules have played an important role in the calculation of phase equilibria and other thermodynamic properties of non-polar fluid mixtures. In the application of supercritical fluids to separation processes, volumetric as well as phase equilibrium properties are very important for rational process design. Heyen (1980) proposed a cubic equation of state which shows better accuracy in the calculation of volumetric properties, compared to the Peng-Robinson equation of state. In order to apply his equation to polar mixtures, Heyen recently proposed a density-independent mixing rule, but this does not obey the universally-observed quadratic mixing rule of the second virial coefficient in the low-density limit. The paper proposes a new density-dependent mixing rule for the Heyen equation of state. The Heyen equation of state with the author's new mixing rule appears to calculate the phase equilibria and the volumetric properties of CO_2 -containing non-polar as well as polar mixtures with good accuracy. 62055 Kink and phase transition in three-dimensional system with double-well potential. Yang Zhen-qing, Chang Shu-ren (Dept. of Phys., Nan-kai Univ., Tientsin, China).

Commun. Theor. Phys. (China), vol.2, no.1, p.803-9 (1983).

The authors present a three-dimensional system in which kinks and phase transitions are treated at a unified level. As in the two-dimensional case, there are two sorts of kink which correspond to domain walls with 90° and 180° transition angles. But there are also two types of phase transition, one of which is displacive and the other is of order-disorder. (8 refs.)

62056 Microscopic surface tension and binary nucleation. C.Flageollet-Daniel, J.P.Garnier, P.Mirabel (Inst. de Chimie, Univ. Louis Pasteur, Strasbourg, France).

J. Chem. Phys. (USA), vol.78, no.5, p.2600-6 (1 March 1983).

Experimental results concerning the binary homogeneous nucleation from the vapor phase of water-alcohols mixtures are reexamined. It is shown that the large discrepancies between theory and experiment can be explained by the fact that, for those mixtures, the use of macroscopic surface tension values is not applicable to binary droplets. A lattice model is developed to describe a microscopic cluster. This allows the determination of the surface monolayer composition, and the calculation of the actual surface tension as a function of the cluster size. The introduction of this model in the classical theory of binary nucleation restores good agreement with the experimental results. (27 refs.)

62057 Kinetics of phase separation in binary fluids: nucleation near the critical point. J.S.Langer (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).

Physica A (Netherlands), vol.118A, no.1-3, p.282 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

Summary form only given, as follows. Recent interest in nucleation problem has been stimulated, at least in part, by a sharp disagreement between conventional droplet theories and observations of anomalously large supersaturations in binary fluids near their critical points. This problem apparently has been resolved by examining actual completion rates instead of focusing attention only on rates of droplet formation. Current calculations are in reasonable agreement with observed cloud points, but more detailed predictions of average sizes and numbers of droplets as functions of time after quench have not yet been checked by experiment. One outstanding theoretical problem is that of joining the early stage nucleation theory to the late stage theory of coarsening. An improved analysis of this transition will be necessary in order to make accurate predictions of the size distribution of droplets throughout the reaction. It will also be necessary to generalize the Lifshitz-Slyozov-Wagner theory of coarsening to account for finite volume fractions of the nucleating phase, especially if one wants to extend the theory to describe the relatively deep quenches achieved near the critical point. (10 refs.)

62058 Nucleation and growth of nonclassical droplets. D.W.Heermann, W.Klein (Dept. of Phys., Boston Univ., Boston, MA, USA).

Phys. Rev. Lett. (USA), vol.50, no.14, p.1062-5 (4 April 1983).

Nucleation and growth are studied in the metastable region of the Glauber-kinetic Ising model with medium-range interactions. Monte Carlo data indicate that the nucleating droplets are not in general compact but quickly become so during the initial phase of growth and then grow as compact droplets. This two-stage growth process is also predicted by a qualitative theory. (20 refs.)

62059 Effective field theory for interface delocalization transitions. R.Lipowsky, D.M.Kroll, R.K.P.Zia (Sektion Phys., Ludwig-Maximilians-Univ. Munchen, Munchen, Germany).

Phys. Rev. B (USA), vol.27, no.7, p.4499-502 (1 April 1983).

Semi-infinite systems are considered which give rise to a delocalization transition of the interface between two coexisting phases. Since the interface position becomes a zero mode at the transition, interface fluctuations invalidate mean-field theory for space dimension $d \leq 3$. An effective field-theoretic model for this zero mode is obtained via the collective-coordinate method. Results for a simplified version of this model in $d=2$ and in $d=3$ are reported. (23 refs.)

64.70 PHASE EQUILIBRIA, PHASE TRANSITIONS, AND CRITICAL POINTS

(see also 81.30 Phase diagrams and microstructures developed by solidification and solid-solid phase transformations)

62060 Phase equilibria in systems of TiX with Cd(Zn)X (X=S, Se, Te). F.Kh.Guseinov, M.B.Babanly, A.A.Kuliev (S.M. Kirov State Univ., Azer-baidzhan SSR).

Inorg. Mater. (USA), vol.18, no.5, p.642-5 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.759-63 (May 1982). [received: Feb. 1983]

The phase equilibria in TiX-Zn(Cd)X systems have been investigated by DTA, X-ray phase analysis, and measurement of the microhardness of the alloys. In these systems no TiZn(Cd)X₂ compounds are formed, the existence of which has been suggested previously in the literature. The TiSe-Zn(Cd)Se systems belong to the simple eutectic type and in the neighborhood of TiSe are characterized by a degenerate eutectic. A thermodynamic analysis has been made of the liquidus of the TiSe-CdSe and TiTe-Zn(Cd)Te systems in a regular-solution approximation with allowance for dissociation of the thallium chalcogenides in the liquid phase. (9 refs.)

62061 The Ti₂Te+Ge=2Ti+GeTe ternary interlinked system. N.A.Kulieva, M.B.Babanly, I.S.Sattar-zade (S.M. Kirov State Univ., Azer-baidzhan SSR).

Inorg. Mater. (USA), vol.18, no.5, p.646-9 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.764-8 (May 1982). [received: Feb. 1983]

The phase equilibria in the Ti₂Te+Ge=2Ti+GeTe system were investigated by differential thermal analysis and X-ray diffraction analysis and measurements of the EMF values and microhardnesses. It was established that the Ti₂Te-GeTe boundary system is quasi-binary and is characterized by the formation of Ti₃GeTe₂ and Ti₂GeTe₂ intermediate phases. The liquidus surface of the Ti₂Te+Ge=2Ti+GeTe system is primarily the region of primary crystallization of the solid solutions on the basis of Ge, which proceeds via a monotectic reaction over a significant range of concentrations. It is shown that Ti+Ge+Ti₂Te, Ti₂Te+Ti₃GeTe₂+Ge, Ti₂GeTe₂+GeTe+Ge three-phase regions that are bound by Ge-Ti₂Te (Ti₃GeTe₂, Ti₂GeTe₂) tie lines exist in this system below the solidus. (7 refs.)

62062 The establishment of equilibria in the Pd-H₂-D₂-H₂O-D₂O system. S.G.McKee, F.A.Lewis, J.P.Magennis, T.J.Kelly (Chem. Dept., Queen's Univ., Belfast, N Ireland).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.475-80 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

Palladium can absorb large volumes of the isotopes of hydrogen. Analysis of the ratios of isotopes in outgassed mixtures provides a means of determining electrolytic isotopic separation factors and also of determining ratios of isotopes absorbed within electrodes after equilibria have been established with respect to the hydrogen and deuterium dissolved in surrounding mixtures of H₂O and D₂O. Measurements were made at values of hydrogen (deuterium) contents corresponding to the α , α - β and β phase composition ranges in the Pd-H(D) system. (21 refs.)

62063 Generalized phase diagram polymer-solvent. V.P.Budtov. *Vysokomol. Soedin. Ser. A (USSR)*, vol.25, no.3, p.493-9 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

The analytical expressions for the spinodal and binodal on the phase diagram of a polymer solution are derived with and without taking into account the concentration dependence of the χ parameter. The method of drawing of the generalized phase diagram is proposed. Such a diagram in the proposed coordinates is general for a wide range of flexible polymers of various MM in different solvents. The calculated dependences are compared with experimental data for solutions of polystyrene, polyisobutylene and polyethylene in various solvents. The good coincidence of analytical expressions and experimental results is shown. (11 refs.)

62064 Volume dependence of melting temperature at high pressure and its relation to a new dimensionless quantity. U.Walzer (Akad. de Wissenschaften, Zentralinst. fuer Phys. der Erde, Jena, Germany). *Exp. Tech. Phys. (Germany)*, vol.31, no.1, p.33-51 (1983). In German. The dependence of melting temperature on the atomic volume is inferred in two separate ways from different assumptions. The first deduction is based on an interatomic pair potential and a dislocation model, while the second one is based on the equation of state by Ullmann and Pan'kov, on an expression for the dependence of the Grüneisen ratio on pressure and bulk modulus and on Lindemann's law. It is also possible to infer the equation of state from the lattice theory alone. From this, the exponents of the $T_m(v)$ equations are independently determined. They are found to be in agreement. Reversing the sequence of conclusions, one may, if one accepts the other aforementioned premises, infer Lindemann's law. However, this applies only for high coordination numbers and high pressures, respectively. If one might proceed from the assumption that, at an approximate pressure, but at an assumed zero temperature, the materials of the Earth's core would exist in the form of a close-packed structure, it is possible to determine the ratio of melting temperature to formula weight as a function of the pressure for the actual Earth's core. (52 refs.)

62065 Kinetics of bulk melting and overheating of metals. A.P.Baikov, V.I.Motorin, S.L.Musher, A.F.Shestak (Inst. of Automation & Electrometry, Acad. of Sci., Novosibirsk, USSR). *Fiz. Met. & Metallogr. (USSR)*, vol.55, no.2, p.323-30 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. A theory is developed of homogeneous nucleation in the course of bulk melting of metals. An expression is obtained for the overheating above the melting point $\Delta T = T - T_m$ (for typical metals $\Delta T = 100-200^\circ\text{C}$). The results are reported of an experimental study in which such values of ΔT were observed in the course of rapid Joule heating of copper samples. It is shown that the rate of growth of nuclei of the liquid phase is governed by the microscopic kinetics of melting and that the elastic forces have practically no influence on the dynamics of nucleation. The results are applicable also to other substances characterized by a low specific heat. (29 refs.) A.T.

62066 Phase diagram and transition properties of condensed ammonia to 10 kbar. R.L.Mills, D.H.Liebenberg, Ph.Pruzan (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA). *J. Phys. Chem. (USA)*, vol.86, no.26, p.5219-22 (23 Dec. 1982). A piston-cylinder apparatus was used to measure the transition curves and corresponding volume changes in condensed NH_3 from 200 to 305K (0.9-10.5 kbar). The melting curve had two distinct branches: a lower one bounding solid I and an upper one bounding solid II. The two melting curves intersected at 217.34K (3.070 kbar), forming a solid I-solid II-liquid triple point. The solid I-solid II transition line was determined from the triple point up to 224K (8.0 kbar). From sound-velocity measurements, it appeared that ultrasonic signals were completely attenuated in both solids over wide P - T regions adjoining the melting curves. (17 refs.)

62067 Applications of thermoanalytical techniques to the study of crystallization kinetics in glass-forming liquids. I. Theory. H.Yinnon, D.R.Uhlmann (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA). *J. Non-Cryst. Solids (Netherlands)*, vol.54, no.3, p.253-75 (March 1983). A critical review is presented of mathematical method advanced over the last 20 years for the analysis of data obtained from non-isothermal thermoanalytical studies of crystallization of glass-forming liquids. The methods are based on the Avrami treatment of transformation kinetics and define an effective crystallization rate coefficient having an Arrhenian temperature dependence. Several different way of mathematically treating the data have been proposed. Most are shown to be based on an incorrect neglect of the temperature dependence of the rate coefficient. By taking proper account of the temperature dependence of the crystallization rate coefficient, the methods are shown to lead to similar conclusions. In detail, it is shown that the effective activation energy of the overall crystallization process can be calculated from the slope of the line obtained by plotting $\ln[Q/(T^2 - T_0)]$ versus $1/T^2$, where T^2 is the temperature of maximum crystallization rate, T_0 is an initial temperature and Q is the heating rate employed in the experiment. 62068 Interstitial polymers based on a polyurethane network. I. Melting points and fractional crystallinities. I.Aladescu, N.B.Graham, R.W.Richards (Dept. of Pure & Appl. Chem., Univ. of Strathclyde, Glasgow, Scotland). *Polymer (GB)*, vol.24, no.3, p.279-84 (March 1983). The preparation of a series of interstitial polymers based on a polyurethane network is described, the 'guest' polymers being poly(methyl acrylate) and poly(methacrylic acid). Differential scanning calorimetry has been used to determine the melting points and heats of fusion of the interstitial polymers, and the latter data being used to calculate fractional crystallinity. Both melting point and crystallinity are reduced as the weight fraction of guest polymer increases, crystallinity disappearing entirely in the case of the poly(methacrylic acid) interstitial. For this latter material, there is evidence for the formation of a complex between the poly(methacrylic acid) and the network chains. (37 refs.)

62069 Thermal and mechanical properties of tetramethyl-p-silphenylenesiloxane/dimethylsiloxane block copolymer. Y.Nagase, T.Fukatsu, K.Ikeda, Y.Sekine (Dept. of Chem., Waseda Univ., Tokyo, Japan). *Polymer (GB)*, vol.24, no.4, p.463-8 (April 1983). Several kinds of tetramethyl-p-silphenylenesiloxane/dimethylsiloxane (TMPS/DMS) block copolymers having various compositions and segment lengths were synthesized. For these copolymers, differential scanning calorimetry was carried out to determine the melting temperatures, the heat of fusion and the crystallinities. The stress-strain behaviour and the dynamic mechanical behaviour were also investigated for these copolymers. The tensile strength was decreased and the percentage elongation was increased with increasing DMS content and segment length. In the case of the copolymers for which the DMS contents remained constant at 26 wt.%, two major transitions were observed at around -120° and -10°C for the copolymers having DMS block sizes of 300, 380 and 540. (13 refs.)

62070 Composition stabilization of a Ga-Al-Sb-As liquid phase (thermodynamic analysis). A.N.Baranov, Yu.P.Yakovlev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.385-7 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.888-92 (July 1982). [received: April 1983] The composition of a Ga-Al-Sb-As liquid phase in contact with a GaAs substrate can be stabilized. After the interaction with this substrate, the composition of the melt will be the same despite a variation of the original antimony concentration over a rather broad range. The authors offer a thermodynamic derivation of this effect; the composition stabilization of a liquid phase in contact with a certain substrate. (8 refs.)

- 62071** Critical and supercritical fluids. J.S.Rowlinson (Phys. Chem. Lab., Oxford Univ., Oxford, England). *Fluid Phase Equilibria (Netherlands)*, vol.10, no.2-3, p.135-9 (March 1983). (Supercritical Fluids. Their Chemistry and Application, Cambridge, England, 13-15 Sept. 1982). The characteristic properties of fluids at the gas-liquid critical point and in the supercritical state are described briefly. (13 refs.)
- 62072** Mean-field lattice gas description of vapour-liquid and supercritical equilibria. L.A.Kleintjens (Res. & Patents, DSM, Geleen, Netherlands). *Fluid Phase Equilibria (Netherlands)*, vol.10, no.2-3, p.183-90 (March 1983). (Supercritical Fluids. Their Chemistry and Application, Cambridge, England, 13-15 Sept. 1982). Recently the authors improved the mean-field two-component lattice-gas model introducing interacting surface areas and an empirical entropy of mixing parameter. The treatment in its present form has proven to be well capable of describing almost quantitatively fluid-phase behaviour of non-polar and polar substances of low- and high molar mass and mixtures thereof in large temperature and pressure ranges. The model works particularly well in the critical fluid region which allows adjustment of the parameters to scarce experimental data with expressions for spinodal, critical condition and equation of state. (30 refs.)
- 62073** Thermophysical properties of supercritical fluids with special consideration of aqueous systems. E.U.Franck (Inst. fuer Phys. Chem., Univ. Karlsruhe, Karlsruhe, Germany). *Fluid Phase Equilibria (Netherlands)*, vol.10, no.2-3, p.211-22 (March 1983). (Supercritical Fluids. Their Chemistry and Application, Cambridge, England, 13-15 Sept. 1982). Selected thermophysical properties of polar, dense supercritical fluids are discussed. The static dielectric constant of water and the freon R22 (CHClF_2) is shown in some detail. Examples of critical curves for binary systems with water and methanol are given. New experimental data of excess volumes up to 400°C and 2000 bar are shown for water combined with H_2 , CH_4 and benzene. Excess Gibbs energies and activity coefficients for water-benzene are also shown. Results of the solubility of anthracene in ten different high pressure fluids, obtained by UV-spectroscopy, are presented. The PVT-data of concentrated supercritical aqueous NaCl-solutions and the ion product of pure water to 1000°C are discussed. (35 refs.)
- 62074** Thermodynamics of supercritical steam+carbon dioxide mixtures. C.J.Wormald, C.N.Colling, G.Smith (School of Chem., Bristol Univ., Bristol, England). *Fluid Phase Equilibria (Netherlands)*, vol.10, no.2-3, p.223-31 (March 1983). (Supercritical Fluids. Their Chemistry and Application, Cambridge, England, 13-15 Sept. 1982). Measurements of the excess enthalpy of steam+carbon dioxide have been made at temperatures from 363 to 698K at pressures up to 6 MPa. Analysis of the measurements at low pressures yields values of the cross term second virial coefficient B_{12} . Evidence for a specific interaction between water and carbon dioxide is found, the enthalpy of association is $\Delta H = -14 \pm 2 \text{ kJ mol}^{-1}$. The measurements at high pressures are fitted by the Peng-Robinson equation of state using values of the interaction parameter k_{ij} which are temperature dependent. (25 refs.)

62075 Phase equilibria and critical phenomena in fluid (n-alkane+water) systems at high pressures and temperatures. T.W.De Loos, J.H.Van Dorp, R.N.Lichtenthaler (Dept. of Chem., Delft Univ. of Technol., Delft, Netherlands).

Fluid Phase Equilibria (Netherlands), vol.10, no.2-3, p.279-87 (March 1983). (Supercritical Fluids. Their Chemistry and Application, Cambridge, England, 13-15 Sept. 1982).

In fluid (n-alkane+water) mixtures (gas+gas) equilibria of the second type are found. Phase equilibria in fluid (n-pentane+water) and (n-heptane+water) were measured in the temperature range 600 to 675K and at pressures from 15 to 170 MPa. The critical curve of these systems starts at the critical point of pure water and runs through a temperature minimum with increasing pressure. Experimental results are compared with previous studies and it is found that the data fit very well within the systematics of other (n-alkane+water) systems. (15 refs.)

62076 High-pressure phase studies on fluid mixtures of low-volatile organic substances with supercritical carbon dioxide. R.Konrad, I.Swaid, G.M.Schneider (Dept. of Chem., Univ. of Bochum, Bochum, Germany).

Fluid Phase Equilibria (Netherlands), vol.10, no.2-3, p.307-14 (March 1983). (Supercritical Fluids. Their Chemistry and Application, Cambridge, England, 13-15 Sept. 1982).

Two high-pressure phase equilibrium cells working according to the analytical method in the temperature range 300 to 450K and up to 200 MPa have been developed. In the first cell p,T,x,y equilibrium data can be determined by sampling and GC analysis. With this cell the gas-liquid phase behaviour of the ternary systems carbon dioxide+tridecane+hexadecane and carbon dioxide+tridecane+1-hexadecanol were determined at 423.4K and between 8 and 35 MPa. For the second apparatus a spectroscopic high-pressure cell fitted with two pairs of sapphire windows was developed. Molar absorptivities are obtained from calibration runs in the homogeneous region. Gas-liquid phase equilibria in the system decane+CO₂ were investigated from 342.8 to 400.2K and between 10 and 20 MPa; here absorption data were measured in the NIR region. (15 refs.)

62077 Steam explosion experiments with single drops of iron oxide melted with a CO₂ laser. L.S.Nelson, P.M.Duda (Sandia Nat. Labs., Albuquerque, NM, USA).

High Temp.-High Pressures (GB), vol.14, no.3, p.259-81 (1982). (10th Plansee Seminar on 'Trends in Refractory Metals, Hardmetals, and Special Materials, and their Technology', Reutte, Austria, 1-5 June 1981).

A carbon dioxide laser has been used to prepare single drops of molten iron oxide. Both spontaneous and triggered steam explosions can be produced when these drops fall into water. The techniques used permit quantitative examination of film boiling and the explosions via high-speed photography and pressure transducer traces. Permanent gas present in the boiling layer prevents spontaneous explosions of the drops. This gas is air entrained by the drops as they enter the water. There is a threshold region for triggering via an applied pressure transient between 0.2 and 0.4 MPa. Below this region there are no explosions; above, prompt explosions always occur. In the threshold region, the drops undulate violently and finally explode after delays as long as 100 ms. The steam explosion can involve multiple events where a steam bubble alternatively grows and collapses as the melt fragments. Significant pressures are generated by the collapse of these bubbles; these pressures are in the range 10-50 MPa near the drop. During the explosion, one molten iron oxide drop fragments into several million particles. Heat-to-work conversions of 2-3% have been estimated for single-drop experiments. (54 refs.)

62078 Molecular composition of zinc-germanium diphosphide vapour. I.S.Gorban' (Acad. of Sci., Ukrainian SSR), G.Sh.Viksmán, S.B.Pyatakova, I.I.Tichina.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.2, p.70-2 (1983). In Ukrainian.

The evaporation mechanism and molecular composition of the ternary diamond-like semiconductor ZnGeP₂ vapour are determined by the mass-spectrometric method. The investigations show that evaporation of the ZnGeP₂ is dissociational. The ratio of the vapour compounds (Zn, P, P₂, P₃, Ge) is determined by the evaporation temperature. (6 refs.)

62079 Vaporization behaviour of the system AlF₃(s)-Al(l). H.Kvande (Inst. of Silicate & High-temperature Chem., Univ. of Trondheim, Trondheim, Norway).

High Temp.-High Pressures (GB), vol.14, no.3, p.245-52 (1982). (10th Plansee Seminar on 'Trends in Refractory Metals, Hardmetals, and Special Materials, and their Technology', Reutte, Austria, 1-5 June 1981).

Two methods, the boiling point method and the transpiration method, have been used to determine the partial pressures of AlF₃(g) and Al₂F₆(g) over solid aluminium trifluoride. These partial pressures are subtracted from the measured total pressure over AlF₃(s)+Al(l) to give the partial pressure of AlF(g), formed by the reaction $\frac{1}{3}\text{AlF}_3(\text{s}) + \frac{2}{3}\text{Al}(\text{l}) = \text{AlF}(\text{g})$. Thermodynamic values for these vaporization reactions are calculated and compared with literature data. (26 refs.)

62080 Thermodynamic functions for the congruent sublimation of cadmium telluride. B.de Lary, A.Finch, P.J.Gardner (Dept. of Chem., Royal Holloway Coll., Egham, England).

J. Cryst. Growth (Netherlands), vol.61, no.2, p.194-8 (March 1983).

Using a modified entrainment method the enthalpy and entropy changes for the reaction $\text{CdTe}(\text{c}) = \text{Cd}(\text{g}) + 0.5 \text{Te}_2(\text{g})$ at 298.15K were determined as 72.0±0.9 kcal mol⁻¹ and 51.0±0.8 cal K⁻¹, respectively, both values being significantly higher than previous estimates. (28 refs.)

62081 Study of the vaporization of solid AlAs. P.Imperatori, D.Ferro, V.Piacente (Istituto di Chimica Fisica, Univ. Degli Studi, Rome, Italy).

J. Less-Common Met. (Switzerland), vol.90, no.1, p.57-63 (March 1983).

The vaporization of solid AlAs was studied using the mass spectrometry and Knudsen effusion techniques. This compound vaporizes according to the reaction $\text{AlAs}(\text{s}) = \text{Al}(\text{s}) + \frac{1}{2}\text{As}_2(\text{g})$. The pressure of As₂(g) depends on the temperature according to the equation $\log P = (9.0 \pm 0.5) - (17.2 \pm 0.4) \times 10^3/T$, where P is in kilopascals. A value of $\Delta H_{298}^\circ = 163 \pm 7 \text{ kJ mol}^{-1}$ associated with the vaporization reaction was derived by second-law treatment of the pressure data. The free-energy function and the standard heat of formation ($\Delta H_{\text{form}}^\circ = 62 \pm 7 \text{ kJ mol}^{-1}$) of AlAs(s) were also calculated. (11 refs.)

62082 Kinetics of the cubic-hexagonal transformation of cadmium sulfide. K.Matsumoto, K.Takagi (Res. Inst. of Electronics, Shizuoka Univ., Hamamatsu, Japan), S.Kaneko.

J. Electrochem. Soc. (USA), vol.130, no.2, p.423-6 (Feb. 1983).

The kinetics of cubic-hexagonal transformation of CdS conforms to a second-order rate equation with an activation energy of ca. 67 kcal/mol. The transformation is enhanced by the addition of NaCl of 0.001-0.1 weight ratio with little change of the activation energy. The role of the NaCl added is considered to reside, in that NaCl makes the movement and rearrangement of atoms in CdS easy as a flux, and that the contact points of CdS particles with NaCl provide the starting points of the further phase transformation. The mechanism of this transformation is presumed to be a linear growth process where the cubic-hexagonal interface moves progressively along the [111] direction of the cubic form. (21 refs.)

62083 Thin colloidal crystals: a series of structural transitions. B.Pansu, P.Pieranski, L.Strzelecki (Lab. de Phys. des Solides, Univ. de Paris-Sud, Orsay, France).

J. Phys. (France), vol.44, no.4, p.531-6 (April 1983).

The authors study thin layers of colloidal crystals made of polystyrene balls (1.1 µm diameter) in aqueous suspension. These thin layers are produced by confining colloidal crystals between two glass planes, which act as repulsive and perfectly smooth boundaries at colloidal scales. When the two planes form a wedge, a continuous passage from 2 to 3 dimensions is realized. Direct observation with an optical microscope reveals that this passage is characterized by a series of structural transitions consisting of changes in the number of layers and also in the structure of each layer. (9 refs.)

62084 Effect of pressure on the thermal hysteresis of a first-order transition. A.N.Das (Kandi Raj Coll., Kandi, Murshidabad, India), B.Ghosh.

J. Phys. C (GB), vol.16, no.10, p.1799-802 (10 April 1983).

The third- and fifth-order couplings between elastic strains and the order parameter of a first-order transition have been considered in the Landau free-energy expansion. The thermal hysteresis becomes pressure-dependent owing to the fifth-order coupling. The behaviour of the thermal hysteresis and the pressure hysteresis observed in some transitions of (NH₄)₂H(SO₄)₂ and (NH₄)HSO₄ crystals has been explained. (10 refs.)

62085 Effect of third- and fifth-order coupling terms on the spontaneous strain of a second-order structural phase transition. A.N.Das (Kandi Raj Coll., Kandi, Murshidabad, India), B.Ghosh.

J. Phys. C (GB), vol.16, no.10, p.1803-5 (10 April 1983).

The third- and fifth-order couplings between the order parameter and elastic strains for a second-order structural phase transition have been considered in the Landau phenomenological free-energy expansion and it is shown that the ratio of the contributions to the spontaneous strain due to the fifth-order coupling and the sum of third- and fifth-order coupling is directly related to the ratio of the temperature derivative of the order parameter and that of the spontaneous strain. (7 refs.)

62086 A theory of incommensurate phase transitions in anisotropically stressed BaMnF₄. J.Lorenc (Carnegie Lab. of Phys., Univ. of Dundee, Dundee, Scotland).

J. Phys. C (GB), vol.16, no.10, p.1807-26 (10 April 1983).

A simplified theory of incommensurate phase transitions in anisotropically stressed BaMnF₄ is proposed. The equilibrium properties and phase transitions induced by temperature and/or anisotropic stress are analysed in terms of the Landau-Ginzburg theory. A conjecture concerning the phase diagram is presented. The occurrence of critical end points or $n=2$ component 'renormalised' tricritical points is demonstrated within the renormalisation group approach. (31 refs.)

62087 Evidence for the incommensurate phase in AlPO₄ near α - β transition: a differential scanning calorimetry study. J.Durand, M.Lopez, L.Cot, O.Retout (Lab. de Chimie des Matériaux, Ecole Nat. Supérieure de Chimie, Montpellier, France), P.Saint-Gregoire.

J. Phys. C (GB), vol.16, no.11, p.1311-15 (20 April 1983).

Careful measurements of the specific heat of AlPO₄ near α - β phase transition are presented. They show that the intermediate phase is also realised in AlPO₄ in a temperature range of about 1°. The results are briefly discussed in comparison with those of quartz, in which an incommensurate intermediate phase has recently been discovered. (12 refs.)

62088 An X-ray diffraction study of the δ - α' transformation in a Pu-2 at.% Al alloy. E.G.Zukas, S.S.Hecker, R.A.Pereyra (Los Alamos Nat. Lab., Los Alamos, NM, USA).

J. Nucl. Mater. (Netherlands), vol.115, no.1, p.63-8 (March 1983).

The face-centered cubic (FCC) δ phase of plutonium is stable from 310° to 458°C. An addition of 2.0 at.% aluminium retains the δ phase metastably to room temperature. This δ phase transforms to α' during subzero thermal treatments. Under hydrostatic compression at room temperature, the δ transforms initially to β' , and this then transforms to α' at the higher pressures. During mechanical polishing, the δ phase transforms to α' . An X-ray diffraction study of this transformed zone by sequential removal of thin surface layers by electropolishing shows that this transformation is not directly from δ to α' , but from δ to γ with the γ phase then transforming to α' . There is no evidence for the presence of either the β or β' phases when the δ phase is transformed by mechanical polishing. (16 refs.)

62089 The secondary effect of the cooperative Jahn-Teller distortion in rare earth vanadates. H.Unoki (Electrotech. Lab., Ibaraki, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1063-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

A short range interaction between displacement of the rare-earth ion and the local deformation of its environment in rare earth vanadates is noticed. Anomalies in the dielectric constant as well as the specific heat are discussed based on this secondary effect accompanying the cooperative Jahn-Teller phase transition. (10 refs.)

62090 Structural transitions in superionic conductors. M.Parrinello, A.Rahman, P.Vashishta (Argonne Nat. Lab., Argonne, IL, USA). *Phys. Rev. Lett. (USA)*, vol.50, no.14, p.1083-6 (4 April 1983).

The $\alpha \rightarrow \beta$ phase transition in AgI is studied with use of the new molecular-dynamics technique which allows for a dynamical variation of the shape and size of the cell. In the present model, upon heating of β -AgI, the iodine ions undergo a HCP-BCC transformation and silver ions become mobile, whereas the reverse transformation is observed on cooling of α -AgI. The calculated $\alpha \rightarrow \beta$ transition temperature and structural and dynamical properties are in good agreement with experiments. (10 refs.)

62091 Two critical points on the γ - α phase boundary of cerium alloys. J.D.Thompson, Z.Fisk, J.M.Lawrence, J.L.Smith (Center for Materials Sci., Los Alamos Nat. Lab., Los Alamos, NM, USA), R.M.Martin. *Phys. Rev. Lett. (USA)*, vol.50, no.14, p.1081-4 (4 April 1983).

It is shown that the P - T diagram for the γ - α phase transition in $\text{Ce}_{0.9}\text{La}_{0.1}\text{Th}_{0.1}$ has two critical points with first-order transitions between them. This phase diagram follows from the Fermi-liquid properties of the $4f$ electronic system, the experimentally known volume dependence of $k_B T_{FL}$, and the dilution effect of alloying. (9 refs.)

62092 Structural transformations in solid nitrogen at high pressure. S.Nose, M.L.Klein (Chem. Div., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).

Phys. Rev. Lett. (USA), vol.50, no.16, p.1207-10 (18 April 1983).

The Andersen-Parrinello-Rahman constant-pressure molecular-dynamics technique has been generalized to study molecular crystals. The method, which appears to have wide applicability, is used to study structural transformations in solid nitrogen at high pressures. (16 refs.)

62093 Structural phase stability in third-period simple metals. A.K.McMahan, J.A.Moriarty (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA). *Phys. Rev. B (USA)*, vol.27, no.6, p.3235-51 (15 March 1983).

Extensive phase-stability calculations for the FCC, HCP, and BCC structures of Na, Mg, Al, and Si are reported both near 1 atm and under high pressure, where Si becomes a natural member of this set of third-period simple metals. Calculations for each element have been carried out by two entirely different first-principles techniques: the generalized pseudopotential theory (GPT) and the linear-muffin-tin orbitals (LMTO) method. The two techniques give results in good qualitative agreement for Mg, Al, and Si and predict sequences of high-pressure structural phase transitions for these elements which arise from the lowering and partial filling of the initially empty $3d$ band under compression. Detailed analysis shows that major trends in the phase stability of the third-period metals are correlated with specific features both in the LMTO one-electron densities of states and in the GPT interatomic pair potentials. Quantitative comparisons between the two theoretical techniques, as well as with available experimental data and other recent calculations, are further used to assess the accuracy of the approximations employed by these methods in calculating structural energy differences. (39 refs.)

62094 Lithium, compression and high-pressure structure. B.Olinger, J.W.Shaner (Los Alamos Nat. Lab., Los Alamos, NM, USA). *Science (USA)*, vol.219, no.4588, p.1071-2 (4 March 1983).

Lithium is found to transform from a body-centered cubic (BCC) to a face-centered cubic (FCC) structure at 6.9 gigapascals (69 kilobars) and 296 kelvin. The relative volume of the BCC structured lithium at 6.9 gigapascals is 0.718, and the FCC structure is 0.25 percent denser. The bulk modulus and its pressure derivative for the BCC structure are 11.57 gigapascals and 3.4, and for the FCC structure are 13.1 gigapascals and 2.8. Extrapolation of the BCC-FCC phase boundary and the melting curve indicate a triple point around 15 gigapascals and 500 kelvin. (12 refs.)

62095 Structural states of MBBA during the transition from a frozen liquid-crystal state to a crystal. V.K.Dolganov, L.A.Novominskii, I.M.Shmyt'ko (Inst. of Solid-State Phys., Acad. of Sci., Chernogolovka, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1476-9 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2605-9 (Sept. 1982). [received: April 1983]

The authors examine the structural changes in the solid state of the liquid crystal MBBA (4-methoxybenzylidene-4'-butylaniline). The warming of the frozen liquid-crystal samples is accompanied by the formation of a large number of metastable phases. The packing of the molecules in these phases is determined by the packing of the molecules in the original liquid-crystal structure. The equilibrium crystal structures which arise during the slow cooling of the nematic mesophase differ from the metastable phases in both their number and crystal structure. The crystal structure of the equilibrium phases is not related to the packing of the molecules in the original liquid-crystal state. The actual structure of the solid crystalline samples in the equilibrium phases obtained in the liquid-crystal-crystal transition 'inherits' the macroscopic packing of the molecules in the liquid-crystal state. (9 refs.)

62096 High-pressure phases in B group element alloys: a new sort of electronic phase. V.F.Degtyareva, E.G.Ponyatovskii (Inst. of Solid-State Phys., Acad. of Sci., Chernogolovka, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1514-19 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2672-81 (Sept. 1982). [received: April 1983]

General relationships are discussed for phase formation in B group element alloys with increasing pressure. The main tendency is determined by the homology rule: the effect of pressure is to change the phase equilibria in the same way as when one component is replaced by a heavier element in the same group. The sequence of relative configurations of stability regions for intermediate phases in the phase diagrams depends on the electron density. As the mean number of electrons in the alloy increases, there is a sequence of phases, accompanied by a decrease in the coordination number and packing density of the structure. Phases with identical structures occur in various systems for similar values of the electron density per atomic volume. Isostructural phases in various systems with equal electron densities have similar values of the transition temperature to the superconducting state. These B-B phases, whose crystal structure and properties are governed by the electron density factor, form a new series of electronic phases of the Hume-Rothery type. (29 refs.)

64.70M Transitions in liquid crystals

62097 Phase-transition studies in polymesomorphic compounds. I. Density studies in N -(p - n -hexyloxybenzylidene)- p - n -butylaniline. N.V.S.Rao, V.G.K.M.Pisipati (Faculty of Phys. Sci., Nagarjuna Univ., Nagar, India). *J. Phys. Chem. (USA)*, vol.87, no.5, p.899-902 (3 March 1983).

The density, ρ , of N -(p - n -hexyloxybenzylidene)- p - n -butylaniline (HBBA) is measured as a function of temperature from the isotropic liquid to the smectic-G phase. The compound is tetramorphic exhibiting three smectic phases S_G , S_B , S_A and a nematic phase. The changes in the density across the phase transformations, and the calculated thermal expansion coefficients, confirm the order of the transitions as first order. The particular importance of the smectic-A to nematic transformation, which is of first order, is apparent from the density jump across the transition. (36 refs.)

62098 The nematic to smectic-A transition: a theoretical overview. T.C.Lubensky (Group de Phys. des Solides, Ecole Normale Supérieure, Paris, France).

J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.1, p.31-43 (Jan. 1983).

The de Gennes model is used as a basis for a discussion of the properties of the nematic and smectic-A phases and the transition between them. Order parameter and director correlation functions and the Landau-Peierls destruction of long range order in the smectic phases are reviewed. A gauge transformation that restores long range order to the smectic phase is introduced. Anisotropic scaling with correlation length exponents, ν_{\parallel} and ν_{\perp} is presented and shown to imply that the critical point in three dimensions with finite splay elastic constant must either be isotropic ($\nu_{\parallel} = \nu_{\perp}$) and in the same universality class as the superconducting transition or anisotropic with $\nu_{\parallel} = 2\nu_{\perp}$. Predictions for the behavior of physically measurable quantities for these two universality classes are presented and compared with experiment. Predictions for both classes are in agreement with some but not all experiments. (60 refs.)

62099 Multicritical phenomena in liquid crystals. D.L.Johnson (Phys. Dept., Kent State Univ., Kent, OH, USA). *J. Chem. Phys. & Phys.-Chim. Biol. (France)*, vol.80, no.1, p.45-51 (Jan. 1983).

A detailed review is given of the progress that has been made toward the understanding of the nematic-smectic A tricritical point and the nematic-smectic A-smectic C multicritical point. Other known or hypothetical liquid crystal multicritical points are reviewed briefly. (84 refs.)

62100 Microscopic and thermal phase studies on smectic and nematic liquid crystals at high pressures. J.Herrmann, H.D.Kleinhan, G.M.Schneider (Dept. of Chem., Univ. of Bochum, Bochum, Germany). *J. Chim. Phys. & Phys.-Chim. Biol. (France)*, vol.80, no.1, p.111-17 (Jan. 1983).

High pressure studies on the phase behaviour of liquid crystals were performed using a high pressure differential thermal analysis equipment and a diamond anvil cell. Results are presented and discussed on the polymorphism in the homologous series of the bis-(4,4'-n-alkoxybenzylidene)-1,4-phenylenediamines as well as to the reentrant nematic behaviour of 4-n-octyloxy-4'-cyanobiphenyl (80CB) and 4-cyanobenzylidene-4'-n-octyloxyaniline (CBOOA) and their mixtures and for pressures up to 3 kbar. (23 refs.)

62101 Effect of the flexibility on the phase transition of polymeric liquid crystals. A.Ten Bosch, P.Maissa, P.Sixou (Lab. de Physique de la Matière Condensée, CNRS, Nice, France). *Phys. Lett. A (Netherlands)*, vol.94A, no.6-7, p.298-300 (21 March 1983).

A mean-field theory of the nematic-isotropic transition in semi-flexible polymers is described. The effect of polymer-chain flexibility on the order parameter and phase-transition temperature is discussed. (12 refs.)

62102 Electrohydrodynamic instability as a nonequilibrium phase transition. S.V.Yablonskii, L.M.Blinov (Sci.-Res. Inst. of Organic Intermediate Products & Dyes, USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.27, no.5, p.562-4 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.936-40 (Sept.-Oct. 1982). [received: April 1983]

The authors have investigated electrohydrodynamic (EHD) instability in a nematic liquid crystal of MBBA near the threshold. From measurements of the diffraction efficiency of the phase lattice formed by the Kapustin-Williams domains together with measurements of the light transmission in the guest-host effect, they calculate the voltage dependence of the maximum angle of inclination of the director. The character of the dependence near the threshold is explained from the viewpoint of the theory of Landau phase transitions. (13 refs.)

62103 Thermodynamic characteristics of phase transitions in a binary smectic system. A.Boiy, P.Adomenas (State Univ., Vilnius, Lithuanian SSR). *Sov. Phys.-Crystallogr. (USA)*, vol.27, no.5, p.606-7 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1010-11 (Sept.-Oct. 1982). [received: April 1983]

The authors have used a Perkin-Elmer DSC-2 scanning calorimeter to study the binary mixture of 4-n-octyl-4'-cyanodiphenyl and 4-n-decyl-4'-cyanodiphenyl. The compounds were synthesized by an earlier method developed by the authors, and purified by distillation, chromatography, and crystallization. The phase diagram of the mixture is shown, and the enthalpies of the mixture phase transitions determined: smectic-isotropic, smectic-nematic, nematic-isotropic, and smectic-isotropic. (4 refs.)

62104 Phase transition from solid crystal to nematic liquid crystal and structural changes in an external electric field. S.I.Tatarinov, A.G.Finkel' (N.G. Chernyshevskii State Univ., Saratov, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.8, p.420-2 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.973-7 (Aug. 1982). [received: April 1983]

Reports the observation of a phase transition from a solid crystal to a nematic liquid crystal in an electric field. The authors have also studied the effect of an external electric field on the structure of the molecules and the solid crystal of 4-methoxy-4'-butylazobenzene (MBAOB) near the phase transition from the solid crystal to the liquid crystal (19°C). These experiments show that a study of the phase transition from a solid crystal to a liquid crystal in an electric field is a subtle method for studying the dynamics of the transition. The authors found from the IR spectra that the conformational changes which accompany the transition occur before the translational order is disrupted. (11 refs.)

64.70P Glass transitions

62105 Photo-illumination effect on the glass transition of annealed amorphous selenium. H.Koseki, A.Oadajima (Dept. of Appl. Phys., Hokkaido Univ., Sapporo, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.3, p.542 (March 1983).

It is well known that a glass after being cooled through the glass-transition temperature (T_g) relaxes towards a metastable state, for a sufficiently long stored time, corresponding to the equilibrium configuration of the supercooled liquid at the given temperature. Therefore, properties of a glass are dependent on its thermal history. In amorphous selenium (a-Se), the structural relaxation has often been investigated by means of thermal analyses such as DSC and DTA. The authors show that the illumination promotes the stabilization of the freshly evaporated film of a-Se, but it probes the reverse effect for the well-annealed films. (4 refs.)

62106 Dependence of the glass transition temperature on relaxation times. T.S.Chow (Xerox Webster Res. Center, Rochester, NY, USA). *Polym. Commun. (GB)*, vol.24, no.3, p.77-9 (March 1983).

A non-equilibrium criterion for the direct determination of kinetic effects on the glass transition temperature of amorphous polymers (T_g) is presented. Expressions for relaxation times are chosen which depend both on temperature and structure. Using the same non-equilibrium viewpoint, the effect of pressure on T_g is discussed. (9 refs.)

62107 Evidence of a 'glassy crystal' phase obtained by the quenching of the plastic phase of the cyanoadamantane. M.Foulon, J.P.Amoureux, J.L.Sauvajol, J.Lefebvre, M.Descamps (Lab. de Dynamique des Cristaux Moleculaires, Univ. de Lille I, Villeneuve d'Ascq, France). *J. Phys. C (GB)*, vol.16, no.10, p.L265-9 (10 April 1983).

The authors present experimental results which show the existence of a 'glassy crystal' phase obtained by the quenching of the 1-cyanoadamantane plastic phase. From the DSC data, the glass transition temperature has been obtained and the glassy crystalline 1-cyanoadamantane has been shown to relax during annealing at 160K. The 'glassy crystal' is cubic (FCC) and is characterised by the vanishing of some low-frequency Raman contributions of the plastic phase. (7 refs.)

64.75 SOLUBILITY, SEGREGATION, AND MIXING

62108 Solubility of hafnium dioxide in cerium dioxide. P.Malou, E.Debray (Univ. Paris Val-de-Marne, Creteil, France), B.Chappey, C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.4, p.245-7 (31 Jan. 1983). In French.

The total electric conductivity and the lattice parameter evolution with hafnia content of $\text{CeO}_2\text{-HfO}_2$ solid solutions shows a remarkable point corresponding to a content adjoining 13 moles % associate to the limit solubility and to the probable formation of a chemically definite compound. (7 refs.)

62109 Thermodynamics of the CaO-SiO_2 system. Y.E.Lee (Technol. Center, Eltek Metals Co., Niagara Falls, NY, USA). *CALPHAD: Comput. Coupling Phase Diagrams & Thermochem. (GB)*, vol.6, no.4, p.283-91 (1982).

In order to maintain consistency, analytical expressions for the free energy of mixing of phases should reproduce not only the phase diagrams but also the experimentally determined activities. Information on the partial molar free energies and the phase boundaries, in turn, can be used to estimate the free energy of formation of compounds. An examination of thermochemical data in the CaO-SiO_2 system showed that ΔG° values for $\alpha\text{-Ca}_2\text{SiO}_4$, which are stable at temperatures above 1710K, are limited a maximum of 1800K. An analytical expression for the free energy of mixing of the liquid phase was obtained for the entire composition range in the CaO-SiO_2 system. Confidence in the estimated ΔG° for $\alpha\text{-Ca}_2\text{SiO}_4$ was demonstrated by good agreement of the calculated phase diagram and the experimentally determined activity of silica. (20 refs.)

62110 An empirical correlation between enthalpy and entropy interaction coefficients. A.Taskine, L.E.Holappa (Inst. of Process Metall., Helsinki Univ. of Technol., Espoo, Finland). *CALPHAD: Comput. Coupling Phase Diagrams & Thermochem. (GB)*, vol.6, no.4, p.293-6 (1982).

The solution thermodynamics of oxygen in dilute liquid metals have been under active study for the last decades. Considerable progress has been made in the determination of the first order interaction coefficients, ϵ_0 , using the solid electrolyte emf method. This can be expressed in terms of τ , which is considered as the apparent temperature at which the system would become ideal if the enthalpy and entropy interaction coefficients were independent of temperature. Therefore the questions: how universal is the constant τ and is it dependent mainly on the crystal structure of the solvent; and are there any correlations between τ and κ , cannot be answered now. In the future when more accurate values of the interaction energies between atoms in liquid metals become known. The physical explanations for τ and κ can be found. (33 refs.)

62111 Supercritical phase equilibria involving solids. R.Koningsveld, G.A.M.Diepen (Res. & Patents, DSM, Geleen, Netherlands). *Fluid Phase Equilibria (Netherlands)*, vol.10, no.2-3, p.159-72 (March 1983). (Supercritical Fluids, Their Chemistry and Application, Cambridge, England, 13-15 Sept. 1982).

The solubility of solids in supercritical solvents is reviewed in a phenomenological discussion of binary and ternary systems containing one highly volatile component. Solubility and selectivity are greatly determined by the course of the binary critical curves, the ternary critical end-point curves, and the locations of the triple points of the solids. The mean-field lattice-gas model is used to review some important molecular parameters. (7 refs.)

62112 Electron-microscopy study of the decomposition of a supersaturated solid solution in silicon. Yu.Yu.Loginov, V.M.Busygina (Krasnoyarsk State Univ., Krasnoyarsk, USSR). *Inorg. Mater. (USA)*, vol.18, no.5, p.601-5 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.709-14 (May 1982). [received: Feb. 1983]

The dependence of the character of precipitates in Si on the concentration of B and P and the conditions of heat treatment was demonstrated. The previously proposed mechanism of formation of precipitates from the basic admixture (B and P) was confirmed. The role of O and C in the precipitates was demonstrated. (28 refs.)

62113 Quantitative theory of solubility in supercritical fluids. M.Gitterman (Dept. of Phys., Bar-Ilan Univ., Ramat-Gan, Israel), I.Procaccia. *J. Chem. Phys. (USA)*, vol.78, no.5, p.2648-54 (1 March 1983).

The phenomenon of enhanced solubility of solids in supercritical fluids is analyzed. The entire region of pressures is considered on the basis of the thermodynamic approach, independently of specific models. General aspects of the phenomenon have been discovered by considering the slopes of solubility curves. These slopes are shown to diverge near the two existing critical points, namely the lower and upper critical end points. In the case of dilute solutions, a curve of the locus of maxima of slopes of solubility curves is found in the reduced pressure-reduced temperature plane. All available experimental data are unified under this approach and are found to agree with theoretical analysis. The results obtained can be used to optimize supercritical fluid extraction. (24 refs.)

62114 Irreversible effects in the FeTi-H system. J.J.Reilly, J.R.Johnson, J.F.Lynch, F.Reidinger (Dept. of Energy & Environment, Brookhaven Nat. Lab., Upton, NY, USA).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.505-12 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

The equilibrium hydrogen absorption isothermal using annealed strain-free FeTi exhibits only one plateau up to a composition of $\text{FeTiH}_{0.95}$. However, the desorption isotherm exhibits the usual two plateaux. X-ray diffraction

results of samples with compositions within the absorption plateau limits indicate the major phases present to be α and γ , although a small amount of β phase was always detected. Apparently the absorption isotherm represents the direct $\alpha \rightarrow \gamma$ conversion and β phase precipitation is almost completely suppressed. The results are attributed to the influence of lattice strain upon the behavior of the β_1 and β_2 phases. A practical consequence of the effect is the distortion of the pressure-composition isotherm in the β - γ region as a function of hydriding-dehydriding cycles. (10 refs.)

62115 Intermetallic compounds LnNi_5 , $\text{La}_{1-x}\text{Pr}_x\text{Ni}_5$ as sorbents and hydrogenation catalysts ($\text{Ln}=\text{La, Ce, Pr, Nd, Sm, Gd}$). E.M.Savitsky, E.I.Klabunovskii, I.R.Kononenko, N.I.Parfenova, V.P.Mordovin, T.P.Savostyanova, D.E.Bogatin (A.A. Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.528 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

Summary form only given, as follows. The sorption properties of the intermetallic compounds LnNi_5 ($\text{Ln}=\text{La, Ce, Pr, Nd, Sm, Gd}$) and $\text{La}_{1-x}\text{Pr}_x\text{Ni}_5$ ($0 \leq x \leq 1$) were studied in the pressure interval 1-60 atm and at a temperature of 20°C. The hydrogen sorption and desorption kinetics were also examined. It was shown that the sorption properties depend on the intermetallic matrix and on the nature of the rare earth metal contained in it. The effect of these intermetallic compounds and some of their hydrides on the hydrogenation of propene and the enantioselective hydrogenation of ethyl acetate on hydrides modified with $\text{RR}(+)\text{tartaric acid}$ was investigated. It was found that the sorption properties of the intermetallic compounds are connected with their catalytic activity in the hydrogenation reactions: the lower is the equilibrium pressure in the intermetallic compound-hydrogen system the higher is the catalytic activity. Some periodic changes in the sorption and catalytic properties of the LnNi_5 compounds was also found. (no refs.)

62116 Comments on 'Hysteresis in metal hydrides'. N.Shohji (Lab. Nacional de Engenharia e Tecnologia Industrial, Dept. de Metalurgia e Metalomecanica, Sacavem, Portugal).

J. Less-Common Met. (Switzerland), vol.90, no.1, p.15-6 (March 1983).

Flanagan and Clewley (1982) have recently developed an interesting approach to the problem of hysteresis in metal hydrides which appears to be qualitatively correct. Unfortunately the quantitative development of their argument does not appear to be very realistic and hence their results may be applicable only to a very limited number of M-H systems. In order to apply their theory to general M-H systems some modification of the equations may be necessary. Some doubtful assumptions in their paper are identified and possible modifications to their equations are proposed. (2 refs.)

62117 Enthalpies of mixing in some binary liquid alkali perchinate mixtures. W.Lukas, M.Gaune-Escard (Lab. de Dynamique et Thermophysique des Fluides, Univ. de Provence, Marseille, France).

J. Less-Common Met. (Switzerland), vol.90, no.1, p.17-18 (March 1983).

The authors aim was to determine the enthalpies of mixing for the liquid systems $\text{LiReO}_4\text{-CsReO}_4$, $\text{NaReO}_4\text{-CsReO}_4$, $\text{KReO}_4\text{-CsReO}_4$ and $\text{RbReO}_4\text{-CsReO}_4$. (11 refs.)

62118 Observation of the relaxation of composition fluctuations in a binary liquid mixture. N.Easwar, M.Joshua, J.V.Maher, W.I.Goldburg (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA).

Physica A (Netherlands), vol.118A, no.1-3, p.268-81 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

Light scattering was used to study the decay of concentration fluctuations in a critical mixture is isobutyric acid and water. The aim of the experiment was to study the dynamic interaction between composition and velocity in the mixture. At large wavenumber, the structure factor $S(k,t)$ is observed to decay exponentially, with a relaxation rate somewhat smaller than the equilibrium value. At small k , however, there is a marked departure from the exponential relaxation one expects in the absence of coupling between composition and velocity. Also measured was the spinodal ring diameter, k_m , as a function of the total scattered intensity, $C_{\text{tot}}(t) = (2\pi)^{-2} \int S(k,t) k^2 dk$. A calculation of Ruiz, based on the above coupling effect, predicts a linear variation of $\ln k_m(t)$ with $C_{\text{tot}}(t)$ and such a linear variation is observed. (12 refs.)

62119 Fast pressure quenches near the critical point of a binary liquid mixture. E.A.Clerke, J.V.Sengers (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).

Physica A (Netherlands), vol.118A, no.1-3, p.350-70 (March 1983). (Proceedings of the Conference on Nonlinear Fluid Behavior, Boulder, CO, USA, 7-11 June 1982).

Spinoal decomposition can be induced in liquid mixtures near the critical point by application of a fast pressure quench. As a result of such a pressure quench 1) the relative temperature of the system with respect to the critical temperature changes because of the dependence of the critical temperature on pressure, and 2) the absolute temperature of the system changes because of the finite value of the adiabatic thermal pressure coefficient. Experiments show that the first effect is dominant in isobutyric acid+water studied by other investigators and the second effect is dominant in 3-methylpentane+nitroethane studied by the authors. It is demonstrated that the adiabatic thermal pressure coefficient undergoes a rapidly varying anomalous behavior at temperatures very close to the critical temperature. (30 refs.)

62120 Dynamics of phase separation in two-dimensional fluids: spinodal decomposition. S.W.Koch, R.C.Desai, F.F.Abraham (IBM Res. Lab., San Jose, CA, USA).

Phys. Rev. A (USA), vol.27, no.4, p.2152-67 (April 1983).

An extensive computer simulation investigation of the time dependence of spinodal decomposition in a two-dimensional, one-component fluid is reported. This investigation includes constant-temperature and constant-energy simulations, both of which are followed to very long times. The authors observe the detailed density morphology, finding different growth regions for the average size of the formed liquid clusters. The late-time growth law for the average cluster size is found to be $t^{1/2}$ for the isothermal and $t^{1/3}$ for the constant-energy simulation, respectively. The physical origin of these results is explained by asymptotic analysis of the governing equations of cluster growth. A linear hydrodynamic theory for the early stages of the separation process is also presented. (22 refs.)

62121 Dissolution kinetics of the compound ZrAl_3 in liquid aluminium. V.N.Eremenko, Ya.V.Natanzon, V.P.Titov.

Russ. Metall. (GB), no.6, p.204-8 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.211-15 (1981).

The method of successive saturation by means of a disc specimen revolving at rate of 16.67 rad/s for 6-15 h was used. During reaction of zirconium with liquid aluminium at 700°C ($\omega=16.67$ rad/s) the rate of formation of the ZrAl_3 phase is higher than the rate of dissolution of zirconium. Dissolution of ZrAl_3 in liquid aluminium at 750°C for the range of rotation speeds of the

disc specimen 6.61-36.80 rad/s is under diffusion conditions. The solubility, the rate constants of dissolution, and the coefficients of diffusion of zirconium in liquid aluminium were determined. (10 refs.)

- 62122 Thermodynamic properties of Si_2ON_2 . V.I.Koshchenko, Ya.Kh.Grinberg (D.I. Mendeleev Moscow Chem. Technol. Inst., Moscow, USSR). *Inorg. Mater. (USA)*, vol.18, no.6, p.884-6 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1047-9 (June 1982). [received: Feb. 1983]
 Measures the heat capacity of Si_2ON_2 in the range of 5-100K with a vacuum adiabatic calorimeter with automatic control of the adiabatic conditions. Liquid helium and nitrogen were used as the cooling agents. The relative error in the determination of C_p was 0.9 and 0.3% for temperature ranges of 5-25 and 25-100K, respectively. Benzoic acid was used as the standard for determination of the error. (5 refs.)

- 62123 Low temperature thermodynamics of asymmetric Anderson model. N.Kawakami, A.Okiji (Dept. of Appl. Phys., Osaka Univ., Osaka, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.4, p.1119-21 (April 1983).
 With the use of the exact solution, the coefficient of the electronic specific heat (γ) for the asymmetric Anderson model is calculated in the presence of an arbitrary magnetic field. It is also shown that the relation $\gamma = 1/2(\chi_m + \chi_c)$ holds exactly, where χ_m and χ_c are the magnetic and charge susceptibilities at finite magnetic fields. (6 refs.)

- 62124 High temperature heat capacity of some Ag-Nd alloys. A.M.Mulokozi, I.Stapf, H.Jehn (Max-Planck-Inst. für Metallforschung, Inst. für Werkstoffwissenschaften, Stuttgart, Germany). *J. Less-Common Met. (Switzerland)*, vol.90, no.1, p.75-82 (March 1983).
 The heat capacity of Ag-Nd alloys containing 30-45 at.% Nd was investigated in the temperature range 770-950K. The heat of transformation of the Ag_2Nd compound was determined as $122 \text{ J (g atom)}^{-1}$ at 893K. The stress effects on the thermodynamic properties as a result of the orthorhombic-hexagonal phase transformation of Ag_2Nd are discussed. The results confirm the need to complement differential thermal analysis studies with independent observations in order to obtain reliable information on the phase diagrams of silver alloys with light rare earth metals. (7 refs.)

- 62125 Low-temperature specific heats for amorphous Fe-B and Co-B alloys. M.Matsuura (Miyagi Tech. Coll., Miyagi, Japan), U.Mizutani. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1481-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The low-temperature specific heats for amorphous Fe-B and Co-B alloys have been measured over the temperature range 1.5-6K. Like other physical properties for both amorphous alloys, the specific heats show marked contrast with each other. (10 refs.)

65.50 THERMODYNAMIC PROPERTIES AND ENTROPY

- 62126 Comparison of the fitting capabilities of several equations for the composition dependence of excess free enthalpy in binary alloys. J.Vrestal, J.Velisek (Inst. of Phys. Metall., Czechoslovak Acad. of Sci., Brno, Czechoslovakia). *CALPHAD: Comput. Coupling Phase Diagrams & Thermochem. (GB)*, vol.6, no.4, p.297-305 (1982).
 One of the main tasks of thermodynamics in physical metallurgy is the determination of the stability of complex metallic systems. With the development of the basis of single-phase thermodynamic data, an experimental determina-

tion of equilibrium diagrams is frequently complemented by their calculation using thermodynamic methods. For the reasons of calculation it is important to express the dependence of the experimental thermodynamic data (i.e. integral and/or partial excess free enthalpy) on the molar fraction of components. Various functions have been developed to express this dependence and the fitting capabilities of several of these equations are compared with respect to the experimental data for binary metallic systems. (9 refs.)

- 62127 Thermodynamic properties of Si_3N_4 . V.I.Koshchenko, Ya.Kh.Grinberg (D.I. Mendeleev Chem. Technol. Inst., Moscow, USSR). *Inorg. Mater. (USA)*, vol.18, no.6, p.903-5 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1064-6 (June 1982). [received: Feb. 1983]
 Trisilicon tetranitride was obtained by nitriding elementary silicon at 1723K. To measure the heat capacity over the range 5-100K, use was made of a vacuum adiabatic calorimetric apparatus with automatic regulation of the adiabatic conditions. Liquid nitrogen and liquid helium were used as refrigerants. From the value of the ordinates of the $C_p(T)$ and $C_p(\ln T)$ curves, determinations were made, by numerical integration of the values of the enthalpy, $H^0 - H^0_0$, and the entropy, $S^0 - S^0_0$, from which the values of the Gibbs energy function, $(G^0 - H^0_0)/T$, were found. (6 refs.)

- 62128 Thermal stability of cesium monouranate. Shyamala Bharadwaj, S.R.Dharwadkar, G.Chattopadhyay, M.S.Chandrasekhariah (Bhabha Atomic Res. Centre, Bombay, India). *J. Nucl. Mater. (Netherlands)*, vol.114, no.2-3, p.344-6 (Feb. 1983).
 A recent assessment by Sturcken (J. Nucl. Mater., vol.50, p.69, 1974) has shown considerable inconsistency in the thermal stability of Cs_2UO_4 . The authors were prompted to reinvestigate this material. A careful thermogravimetric study with a microbalance in a controlled gaseous environment showed that traces of moisture have considerable influence on the decomposition temperature of this phase. (11 refs.)

- 62129 A thermodynamic interpretation of the compatibility of chlorinated polyethylene with poly(methylmethacrylate). Chai Zhikuan, Sun Rouna (Inst. of Chem., Acad. Sinica, Beijing, China), D.J.Walsh, J.S.Higgins. *Polymer (GB)*, vol.24, no.3, p.263-70 (March 1983).
 The compatibility of chlorinated polyethylene with poly(methylmethacrylate) and the oligomer analogue chlorinated octadecane with oligomeric PMMA are interpreted using the equation of state theory. It is found that the interaction energy parameter χ_{12} and the interaction entropy parameter χ_{12} , obtained from the heat of mixing and the phase boundary of oligomeric mixtures, can be used to generate the phase boundary of the polymer mixture. The spinodals of different molecular weights so generated have less molecular weight dependence than might be expected, in agreement with experimental results. A negative χ_{12} indicates that some ordering may exist in the mixture due to specific interactions. (16 refs.)

- 62130 The relationship between the Gruneisen and other thermodynamic parameters and intermolecular forces in polymers. B.K.Sharma (Dept. of Phys., Regional Coll. of Education, Bhubaneswar, India). *Polymer (GB)*, vol.24, no.3, p.314-18 (March 1983).

A simple relationship between the Gruneisen parameter and Beyer's non-linearity parameter in the case of polymers has been obtained in terms of Mie potential parameters from the pressure dependence of bulk modulus. Using this simple model, it is shown that Beyer's parameter of nonlinearity, Carnevale and Litovitz's acoustical parameter, Moelwyn-Hughes parameter and the Gruneisen parameter are all related to each other and express the same physical quantity for polymers. The contribution of interchain vibrations to the total specific heat and the specific heat ratio has been found from the Gruneisen parameter in case of twelve polymers. It is proposed that the dependence of the isobaric specific heat of polymeric materials on the interchain forces is stronger than of the isochoric specific heat. (52 refs.)

- 62131 Shift of the electron chemical potential in relation to particle size in highly dispersed systems. N.S.Lidorenko, S.P.Chizhik, N.T.Gladikh, L.K.Grigor'yeva, R.N.Kuklin, R.G.Melkadze. *Russ. Metall. (GB)*, no.6, p.883-93 (1981). Translation of: *Izv. Akad. Nauk SSSR Met.*, no.6, p.91-5 (1981).

Due to the dimensional vacancy effect in high-dispersion systems, the chemical electron potential is lower than in the massive material. The dimensional shift of the electron potential leads to a decrease in the electron heat capacity, the magnetic susceptibility, the speed of sound in the small particle, and to an increase in compressibility, the speed of sound in the small particle, and to an increase in compressibility, and this explains the decrease in the cohesion energy and the ability of disperse particles to coagulate. The estimated decrease of the melting point of small particles based on the dimensional shift in the chemical potential of the electron is in agreement with experimental results. (15 refs.)

- 62132 Thermodynamics of nitrogen solutions in alloyed austenite. L.A.Bol'shov. *Russ. Metall. (GB)*, no.6, p.112-18 (1981). Translation of: *Izv. Akad. Nauk SSSR Met.*, no.6, p.115-19 (1981).

A statistical theory is proposed for the thermodynamic activity of nitrogen dissolved in austenite that contains considerable concentrations of alloying transition metals. In the general case it is not possible to describe this quantity for the entire range of possible compositions by means of generalised reaction parameters, because the series are divergent. Use of first- and second-order interaction parameters does not give good agreement with experimental values of the constants of the Sieverts law for nitrogen in the austenitic phase for the stainless 18/5 chromium-nickel steel at 1050°C. Calculation by means of a formula shows good agreement with experimental data. (21 refs.)

- 62133 Thermal expansion of barium orthovanadate. T.I.Krasnenko, O.N.Syrneva, A.A.Fotiev (Inst. of Chem., Ural Sci., Center, Acad. of Sci., Sverdlovsk, USSR). *Inorg. Mater. (USA)*, vol.18, no.6, p.890-1 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1052-3 (June 1982). [received: Feb. 1983]
- Uses $\text{Ba}_3(\text{VO}_4)_2$, the single-phase character of which was confirmed by X-ray diffraction. The X-ray and thermal studies were made with powdered $\text{Ba}_3(\text{VO}_4)_2$ and pellets were prepared for the measurements. Graphs of the dependence of the unit cell parameters and the coefficient of volume expansion of $\text{Ba}_3(\text{VO}_4)_2$ on the temperature are presented. It was established that the character of the α and $c(T)$ curves changes over the 1070-1200K range. The parameters of the samples hardened from 1270K in air and slowly cooled from the same temperature agree with the parameters of the starting sample within the limits of the experimental error. (2 refs.)
- 62134 Anomalous thermal expansion of europium vanadate. N.R.S.Reddy, K.S.Murthy (Dept. of Phys., Univ. Coll. of Sci., Osmania Univ., Hyderabad, India). *J. Less-Common Met. (Switzerland)*, vol.90, no.1, p.L7-8 (March 1983).
- The rare earth vanadates RVO_4 (R=trivalent rare earth ion) crystallize in the tetragonal zircon structure (space group, $I4_1/amd$). As part of a general programme of X-ray investigations of zircon-type compounds, the authors investigated the thermal expansion of europium vanadate at high temperatures. Accurate lattice parameters and the coefficients of thermal expansion at various high temperatures are presented. (3 refs.)
- 62135 Anomalous thermal expansion and character of layers of MV_2O_6 metavanadates ($M=\text{Ca}$, Cd , Zn , Mg , Pb). P.Garnier, D.Weigel (Ecole Centrale des Arts et Manufactures, Chateauf-Malabry, France). *J. Solid State Chem. (USA)*, vol.47, no.1, p.16-23 (15 March 1983). In French.
- The variations of cell parameters and thermal expansion tensors of metavanadates MV_2O_6 have been measured in the range 77-295K. The thermal expansion anisotropy is characteristic of layer structures especially for brannerite-type structures ($M=\text{Cd}$, Zn , Mg); this anisotropy is explained by the presence of $[\text{VO}_5]$ polyhedra, such as occur in the V_2O_5 layer structure. For CaV_2O_6 the variation of thermal expansion as a function of temperature is abnormal; peaks, typical of a diffuse transition, are observed at 260K for $\alpha_1(T)$ and $\alpha_2(T)$ curves. The temperature anomaly is reduced when cadmium is substituted for calcium. (19 refs.)
- 62136 Thermal expansion coefficient of alkali metals. T.Soma, H.-M.Kagaya, Y.Kimura (Dept. of Appl. Phys. & Maths., Mining College, Akita Univ., Akita, Japan). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.57-61 (1 March 1983).
- The thermal expansion of alkali metals is investigated using a local Heine-Abarankov model potential in the perturbational method. The mode Grüneisen parameters and the temperature-dependence of both the mean Grüneisen constant and the thermal expansion coefficient are calculated, and the obtained results are quantitatively in good agreement with the experimental data. 65.90 OTHER TOPICS IN THERMAL PROPERTIES OF CONDENSED MATTER

- 62137 Experimental and theoretical studies of the influence of surface conditions on radiative properties of opaque materials. P.Demont, M.Huetz-Aubert, H.Tran N'Guyen (Groupe de Recherches Thermiques Ecole Centrale des Arts et Manufactures, Chateauf-Malabry, France). *Int. J. Thermophys. (USA)*, vol.3, no.4, p.335-64 (Dec. 1982). [received: April 1983]
- Radiative properties of opaque materials strongly depend on their surface condition. The fabrication of superficial cavities of various forms and dimensions modifies the directional spectral emissivities or absorptivities. They are usually increased compared to those of optically smooth material; the gain depends on the material, the type of cavities, as well as the wavelength λ and the direction Δ of the emitted or incident radiation. When grooves of dimensions larger than λ are fabricated in a sample, the models, taking into account the successive reflections on their inner sides, give a good agreement with experimental data. But a similar theory does not explain the substantial increase of the infrared emissivity of ballblasted samples. (22 refs.)

66.00 TRANSPORT PROPERTIES OF CONDENSED MATTER (NONELECTRONIC)

66.10 DIFFUSION AND IONIC CONDUCTION IN LIQUIDS

- 62138 Predict liquid-phase diffusion coefficients. J.H.Weber (Univ. of Nebraska, Lincoln, NE, USA). *Chem. Eng. (USA)*, vol.90, no.5, p.161-3 (7 March 1983).
- Presents a program for the Texas Instruments TI-59 calculator to determine diffusion coefficients in dilute two-component solutions. The Wilke-Chang (1955), Scheibel (1954) and Reddy-Doraiswamy (1971) correlations are programmed, together with methods for finding liquid volume and viscosity. The program is listed in full. (7 refs.)
- 62139 Transport number of charge-transfer complexes in solution. V.P.Shedibalkar, S.N.Bhat (Chem. Dept., North-Eastern Hill Univ., Shillong, India). *Electrochim. Acta (GB)*, vol.28, no.3, p.359-61 (March 1983).
- Iodine, which is generally a nonconductor in nonpolar solvents, conducts electricity in methanol, ethanol and water. The majority of the charge carriers in the solutions of charge-transfer complexes of methanol-iodine and ethanol-iodine are anion constituents ($i_{-25^\circ\text{C}}$ are 0.739, 0.728 for 0.1N solution of iodine in methanol and ethanol respectively) and for water-iodine it is cation constituent ($i_{+25^\circ\text{C}}$ is 0.905 for 0.0024N iodine). The transport number of anion decreases with the increase in temperature whereas it increases with the increase in concentration at 25°C. (12 refs.)
- 62140 Pressure dependence of conductance of the lithium and cesium ions in cooled and supercooled water. N.Takizawa, J.Osugi, M.Nakahara (Dept. of Chem., Kyoto Univ., Kyoto, Japan). *J. Chem. Phys. (USA)*, vol.78, no.5, p.2591-7 (1 March 1983).
- Limiting molar conductances (λ^0) of the Li^+ and Cs^+ ions in water have been determined at 0, -5, and -10°C as a function of pressure up to 2 kbar. In the studied ranges of pressure and temperature, $\lambda^0(\text{Li}^+)$ increases monotonically with increasing pressure and $\lambda^0(\text{Cs}^+)$ has a maximum against pressure. The low-temperature conductances fit well an empirical equation of the critical law form over the pressure range studied; $\lambda^0=A(T/T_c-1)^{-1}$. The parameter T_c decreases with a rise in pressure below 1.5 kbar, but above that T_c is almost constant. The Hubbard-Onsager (HO) dielectric friction theory has been critically tested against the experimental results obtained under the extreme conditions after λ^0 are transformed into the drag coefficient ($\Delta\zeta$) subtracted by that due to Stokes' law for perfect slip ($4\pi\eta R$). The observed pressure coefficient $d\Delta\zeta/dP$ is negative for the small ion Li^+ even in cooled or supercooled water as predicted by the HO theory but positive for the large ion Cs^+ in contrast to the theoretical prediction. The following three kinds of anomalies in $\Delta\zeta(\text{Cs}^+)$ are revealed: $\Delta\zeta<0$, $d\Delta\zeta/dP>0$, and $d\Delta\zeta/dT>0$. The PTC mechanism proposed for explaining the large anomalies has been supported by model calculations; it turns out that the potential for the PTC process can be flat with a reasonable size of cavities. (30 refs.)
- 62141 Theory of conductance and related isothermal transport coefficients in electrolytes. A.R.Altenberger, H.L.Friedman (Chem. Dept., State Univ. of New York, Stony Brook, NY, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4162-73 (15 March 1983).
- The transport coefficients are calculated from consideration of the fluctuations in local ion concentrations in view of a recent advance in the theory of inhomogeneous systems at equilibrium. The theory is applicable to mixed electrolytes of arbitrary charge type and to frequency dependent phenomena, although the example worked out here is for the zero frequency coefficients for a binary electrolyte. (43 refs.)
- 62142 Diffusivity in zinc chloride-potassium chloride electrolyte. D.Lof-tus, J.Roberts, R.Weaver, S.Leach, L.Nanis (SRI Internat., Menlo Park, CA, USA). *J. Electrochem. Soc. (USA)*, vol.130, no.2, p.332-4 (Feb. 1983).
- Integral and differential salt diffusivities have been measured by the capillary method for electrolytes of interest to mass transfer of zinc in the zinc-chlorine hydrate battery. No dependence of diffusivity on the concentration of ZnCl_2 was found over the range 0.4-1.6M ZnCl_2 in 3.5M KCl. The average diffusivity was $0.88\times 10^{-5}\text{ cm}^2\text{ sec}^{-1}$ at 26.5°C and $1.49\times 10^{-5}\text{ cm}^2\text{ sec}^{-1}$ at 47.5°C. (9 refs.)
- 62143 Chronopotentiometry of one- and two-ion transport at immiscible liquid interfaces: tests of theory. O.R.Melroy, W.E.Bronner, R.P.Buck (Dept. of Chem., Univ. of North Carolina, Chapel Hill, NC, USA). *J. Electrochem. Soc. (USA)*, vol.130, no.2, p.373-80 (Feb. 1983).
- Experimental verification for theoretical behavior of ion crossings at a water/nitrobenzene interface is given. This includes study of migration-dependent single ion transport, as well as diffusion-controlled simultaneous and successive two-ion transport. Chronopotentiograms have been obtained for tetra-n-alkylammonium salts from methyl through heptyl and for tetrabutylammonium ion in supporting electrolytes CsCl through LiCl . These are discussed in terms of partitioning effects, interfering ions, limited potential windows, and free energies of ion transfer. Problems in obtaining 'true' transition times and associated transfer coefficients for various ammonium ions are also discussed. (38 refs.)
- 62144 Diffusion and permeation of hydrogen in sodium [liquid]. J.Trouve, G.Laplanche (Dept. des Reacteurs a Neutrons Rapides, CEN, Saint Paul Lez Durance, France). *J. Nucl. Mater. (Netherlands)*, vol.115, no.1, p.56-62 (March 1983). In French.
- Knowledge about the behaviour of hydrogen impurity in liquid sodium is essential for the design of steam generators in fast reactors. This provides the motivation for the authors' study, in which the behaviour of a thin nickel sheet, serving to measure hydrogen content, was analysed and the diffusion coefficient of hydrogen in sodium was estimated. The aim was to determine an order of magnitude for this coefficient, and its variation as a function of temperature. (6 refs.)
- 62145 Diffusion of oxygen in molten iron. D.Ya.Povolotskiy, O.K.Tokoyov, A.P.Fedulov. *Russ. Metall. (GB)*, no.6, p.52-8 (1981). Translation of: *Izv. Akad. Nauk SSSR Met.*, no.6, p.55-60 (1981).
- A non-steady-state electrochemical method was used to measure the diffusion coefficient of oxygen in liquid iron in the temperature range 1550-1650°C and the activity coefficient of oxygen in iron with initial oxygen contents of 0.0030-0.950%. The temperature dependence of the diffusion coefficient of oxygen in liquid iron was determined. It was found that the content in liquid iron influences only slightly its diffusion coefficient. (16 refs.)

66.20 DIFFUSIVE MOMENTUM TRANSPORT

(inc. viscosity of liquids)

- 62146 An optimal equation for the temperature dependence of the relative viscosity of water in the range of 0...100°C. J.Einfeldt, M.Grigo, N.Schmelzer (Sektion Phys., Pieck Univ. Rostock, Rostock, Germany). *Exp. Tech. Phys. (Germany)*, vol.31, no.1, p.11-20 (1983). In German. Based on the most accurate experimental results of the viscosity of water and their recalculation by Kestin et al. (1973) the present authors have found an optimal temperature-viscosity relation in the range of 0...100°C with the 68.3%-confidential range of 0.01%. This equation reproduces all experimental data within experimental accuracy of 0.1%. With a given temperature-density equation it is also possible to calculate the temperature dependence of the kinematic viscosity of water. The given sets of data and equations can be proposed as a standard for the calibration of viscosimeters. (11 refs.)
- 62147 Viscosity of molten fluorozirconates. Hefang Hu, J.D.Mackenzie (Materials Sci. & Engng. Dept., Univ. of California, Los Angeles, CA, USA). *Non-Cryst. Solids (Netherlands)*, vol.54, no.3, p.241-51 (March 1983). The viscosity of a series of molten fluorozirconates with chemical composition of $30\text{BaF}_2\cdot 60\text{ZrF}_4\cdot 10\text{RF}_n$ (mol.%), where R represents Li, Na, K, Ca, Ba, Zn, Pb, Al, Y, La and Th, has been measured as a function of temperature in a nitrogen atmosphere from 550 to 950°C. Their viscous behavior is characterized by a low viscosity relative to normal glass-forming systems and a rapidly increasing activation energy for viscous flow with decreasing temperature. The melts probably consist of short chains or small rings of Zr_2F_9 anions linked together by cations through non-bridging fluorines. Similar to associated liquids, the degree of association increases with decreasing temperature. (24 refs.)
- 62148 Transport properties in the zero order Gaussian memory function approximation with phase integrals evaluated from Monte Carlo calculations. M.Luckas, K.Lucas (Fachgebiet Thermodynamik, Univ. Duisburg, Duisburg, Germany). *Mol. Phys. (GB)*, vol.48, no.5, p.989-1002 (10 April 1983). A Gaussian approximation to the zero order memory function is used to predict diffusion coefficient, viscosity and thermal conductivity of a pure Lennard-Jones fluid over a large region of states. Equilibrium integrals over the pair and triplet correlation functions are evaluated by Monte Carlo simulations. The results are qualitatively reasonable, but differ in detail from computer experiments and argon data. Various other approximations are also discussed. (17 refs.)

66.30D Theory of diffusion and ionic conduction in solids

- 62149 Relationship between parameters of self-diffusion and of equilibrium defects and characteristics of monatomic crystals. S.M.Klotsman (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.2, p.297-309 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. It is demonstrated that a universal relationship between the self-diffusion parameters and the usually employed thermodynamic characteristics can be established for all monatomic crystals. An analysis of the results obtained only for crystals with monotypic binding forces based on two characteristics (melting point and Debye temperature) reflecting different properties of the interaction potential can yield the dependences of the parameters of self-diffusion and equilibrium defects on these characteristics. These dependences are at least as accurate as the results of experimental determinations of the enthalpy of activation of formation of equilibrium defects and of self-diffusion. (23 refs.) A.T.
- 62150 Motion mechanisms in framework solid electrolytes: correlated hopping and liquidlike diffusion. S.H.Jacobson (Xerox Corp., Rochester, NJ, USA), M.A.Ratner, A.Nitzan. *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4154-61 (15 March 1983). Motion mechanisms for ions in framework solid electrolytes are investigated. The results are obtained from numerical studies on a one-dimensional model system, utilizing the method of stochastic Langevin dynamics. The authors find that, for commensurate systems (for which one mobile ion occurs exactly every l lattice sites), the mechanism always involves correlated hops, and the ion-ion repulsion decreases (always) the total conductivity. For incommensurate systems, the conductivity changes from hopping to liquidlike as the interaction forces are increased to dominate the potential due to the framework lattice. Different assumed ion-ion potentials produce different correlations, both local and overall; the nearest-neighbor harmonic forces, such as are

assumed in the Frenkel-Kontorova model, will generally produce substantially different correlation effects from the Coulomb repulsion. The frequency-dependent conductivity at low frequency is shown to be proportional to the square of the frequency; the proportionality coefficient is positive for correlated hopping mechanisms. A double-peaked structure in the frequency-dependent conductivity, due to local oscillation and to long-time, long-range diffusive behavior, is observed when particle-particle interactions are absent and damping is weak. (31 refs.)

- 62151 Modeling of high field ionic conduction in anodic oxide films. L.Young, D.J.Smith (Electrical Engng. Dept., Univ. of British Columbia, Vancouver, BC, Canada). *J. Electrochem. Soc. (USA)*, vol.130, no.2, p.408-12 (Feb. 1983). Experimental data for the stepped current and open-circuit transient methods were fitted to one form of the modeling equations given by Dignam (1965). A good representation of the data was obtained except that extreme linearity was found for $\log J_2$ vs. E data for the peak field in stepped current experiments where some degree of nonlinearity was expected. Another question involves the role of electrolyte incorporation in causing the observed curvature of steady-state $\log J$ vs. E plots. It is shown that if a model is preferred in which the history effects are due to structural changes in the glassy oxide rather than to the special current-driven polarization model of Dignam, then one can obtain equations equivalent to Dinam's by writing the activation energy for ionic transport as a function of a parameter describing the structural condition of oxide, except that some relations between parameters which follow naturally from Dignam's model do not then appear. (20 refs.)
- 62152 Random walk properties of lattices and correlation factors for diffusion via the vacancy mechanism in crystals. M.Koiwa, S.Ishioaka (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan). *J. Stat. Phys. (USA)*, vol.30, no.2, p.477-85 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982). Random walk properties and correlation factors for diffusion via the vacancy mechanism are calculated and compared for various three-dimensional lattices. By applying the theory of random walks on an imperfect lattice, the correlation factor for impurity diffusion is calculated rigorously for the 'five jump frequency model' in the FCC lattice. 66.30F Self-diffusion in metals, semimetals, and alloys

- 62153 Solvent diffusion in α -silver-tin alloys. T.Hehenkamp, F.Faupel (Inst. fur Metallphys., Univ. Gottingen, Gottingen/Clausthal, Germany). *Acta Metall. (USA)*, vol.31, no.5, p.691-7 (May 1983). Coefficients for diffusion of Ag 110 m in α -Ag-Sn alloys were measured as a function of temperature and concentration over the temperature range 950-1150K and 0 to 9 at.% tin. The latter involves less experimental effort and, as for relative measurements, even proved to be the more accurate. A strong non-linear increase in the solvent diffusion upon alloying was observed in agreement with results on similar alloys, such as Ag-Cd, Ag-In and Ag-Sb. The marked dependence of solvent diffusion on temperature and impurity concentration is discussed in terms of the complex model proposed by Hehenkamp, Schlett and Sander to describe the solvent and solute diffusion beyond the limit of infinite dilution. Changes in the solvent correlation factor upon alloying are taken into account by introducing effective jump frequencies. It is shown, how the experimentally observed proportionality of the normalized solvent diffusion coefficient to the normalized vacancy concentration serves to get useful information about the diffusion behaviour such as the linear enhancement factor, average effective jump frequencies, activation energies and free binding enthalpies of impurity-vacancy-associates. (21 refs.)

66.30H Self-diffusion and ionic conduction in nonmetals

- 62154 High field conduction in propylene carbonate. S.Theoleyre, R.Tobazeon (CNRS, Grenoble, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.4, p.241-4 (31 Jan. 1983). In French. Measurements of transient currents and electric fields show that high field conduction in propylene carbonate between metallic electrodes is mainly due to negative ion injection at the metal-liquid interface. The variations of the current with the applied voltage and with the liquid gap are in accordance with the hypothesis that the ion creation is electrochemical in nature. (9 refs.)
- 62155 Influence of hafnia content on the electronic conductivity of binary oxides $\text{CeO}_2\text{-HfO}_2$. E.Debray, P.Malou, B.Chappey (Univ. Paris Val-de-Marne, Creteil, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.5, p.337-42 (7 Feb. 1983). In French. In $\text{CeO}_2\text{-HfO}_2$ solid solutions, the formative energy of the electronic carriers lowers progressively with hafnia content so long as the latter does not reach the solubility limit; the solute reducing effect is then to a maximum. Beyond the limit the formative energy changes no more whereas the mobility energy is slightly increased. (4 refs.)
- 62156 Recovery of quenched Cu-Ge alloys studied by positron annihilation. I.Kanazawa, H.Murakami, T.Kurihara, Y.Sakurai (Dept. of Phys., Tokyo Gakuji Univ., Tokyo, Japan), M.Doyama. *Jpn. J. Appl. Phys. Part I (Japan)*, vol.22, no.3, p.408-12 (March 1983). The migration stages of single vacancies and vacancy-Ge atom pairs, and their clustering process are studied in quenched Cu-Ge alloys. The decrease in h parameter is observed from about -70°C to about 0°C in quenched Cu-1.0 at.% Ge alloy, and two mechanisms are proposed for this phenomenon. The increase of h parameter is observed by the aging from about 250°C to about 400°C . The stage can be deduced to be the growth of clusters of Ge atoms and vacancies, and gaseous bubbles. The presence of three dimensional small clusters of Ge atoms and vacancies, and stability of the clusters are discussed.

62157 Synthesis and study of electric conductivity of complex oxides in the $\text{Li}_2\text{O-ZnO-TiO}_2$ system. N.V.Porotnikov, N.G.Chaban, K.I.Petrov (M.V. Lomonosov Moscow Inst. of Fine Chem. Technol., Moscow, USSR). *Inorg. Mater. (USA)*, vol.18, no.6, p.906-7 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1066-7 (June 1982). [received: Feb. 1983]
The authors synthesized several compositions of the $\text{Li}_2\text{O-ZnO-TiO}_2$ ternary system and studied their electric conductivity, which at room temperature does not exceed 10^{-8} S/cm. For $\text{Li}_2\text{ZnTiO}_8$ and $\text{Li}_2\text{Zn}_3\text{Ti}_4\text{O}_{12}$, the dependence of the electric conductivity on temperature is exponential in character. The relatively high value of the electric conductivity is due to the low mobility of lithium ions, which in these phases are located at tetrahedral positions. (9 refs.)

62158 Schottky diodes as a possible supplementary method for ionic transport investigations in semiconducting ionic solids—application to $n\text{-CdF}_2$. R.J.Iwanowski, A.Lemanska-Bajorek, J.M.Langer (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland). *J. Phys. (France)*, vol.44, no.4, p.553-8 (April 1983).
Transport measurements, including I - V and C - V characteristics, of the $\text{Au}/n\text{-CdF}_2$ (Y, Mn) diodes have been performed at room temperature. Time changes of the net donor concentration profiles, $N_D^{\text{eff}}(W/V)$, for the diodes biased with constant reverse voltage (V_r) as well as for $V_r=0$ are studied and interpreted using a model of the native point defect structure of the case of $n\text{-CdF}_2$. The results obtained show the possibility of observation of ionic transport in the depletion layer of MS junction for which the conditions of large barrier height and relatively small activation energy of the defect motion are fulfilled. (20 refs.)

62159 Chemical durability of ZrO_2 containing glasses. R.G.Simhan (Manville Service Corp., Denver, CO, USA). *J. Non-Cryst. Solids (Netherlands)*, vol.54, no.3, p.335-43 (March 1983).
Durability studies in water and Lawrence solution of two glasses containing 17% and 9% ZrO_2 are reported. The Na and Si leached from both glasses in water and Lawrence solution show the \sqrt{t} dependence confirming the process to be diffusion controlled. This is true even for longer times. In both solutions the glass with 17% ZrO_2 has the lower loss in sodium and silica. The tensile strength of this glass is also higher after immersion in Lawrence solution. Thus with higher amounts of ZrO_2 in the glass composition, the surface of the fibers is better protected. Possibly the formation of a hydrated layer of ZrO_2 on the surface gives protection at all pH values. (9 refs.)

62160 Effects of proton injection on the electrical properties of ice. V.F.Petrenko, R.W.Whitworth, J.W.Glen (Dept. of Phys., Univ. of Birmingham, Birmingham, England). *Philos. Mag. B (GB)*, vol.47, no.3, p.259-78 (March 1983).
Measurements have been made of the electrical properties of thin monocrystalline samples of ice with hydrogen-loaded palladium electrodes which permit the exchange of protons between the electrodes and the ice. At potential differences greater than 400 V, space-charge-limited currents are produced, and simultaneous measurements of the AC dispersion curves show changes due to the space charge. Experiments with blocking electrodes, and with one injecting and one blocking electrode are also described. A theory of the space-charge-limited properties is developed within the framework of the Jacard theory of the electrical properties of ice. This yields mobilities of H_3O^+ ions at -20°C of $\sim 10^{-6}\text{--}10^{-7}\text{ m}^2\text{V}^{-1}\text{ s}^{-1}$, but these values will be lower limits due to trapping. (8 refs.)

62161 Effect of pressure on the fast-ion conduction in $\text{AgI-Ag}_2\text{O-MoO}_3$ glasses. H.Senapati, G.Parthasarathy, S.T.Lakshmi Kumar, K.J.Rao (Solid State & Structural Chem. Unit, Indian Inst. of Sci., Bangalore, India). *Philos. Mag. B (GB)*, vol.47, no.3, p.291-7 (March 1983).
The effect of pressure (up to 80 kbars) on the electrical conductivity of a series of fast-ion conducting $\text{AgI-Ag}_2\text{O-MoO}_3$ glasses has been investigated. The results are consistent with a cluster model. (14 refs.)

62162 Electrical properties of thin solid films of the solid electrolyte $\text{AgI-W}_2\text{O}_8$. S.A.Suthanthiraraj, B.V.R.Chowdary, S.Radhakrishna (Dept. of Phys., Indian Inst. of Technol., Madras, India). *Thin Solid Films (Switzerland)*, vol.101, no.2, p.131-9 (11 March 1983).
A simple electrolytic method of preparing a solid electrolyte, $\text{Ag}_3\text{IW}_2\text{O}_8$, on a silver substrate is described. Films of different quality are formed when the electrolysis is carried out at different temperatures and current densities. X-ray diffraction studies were also carried out in order to confirm the formation of $\text{Ag}_3\text{IW}_2\text{O}_8$ films by calculating the d spacings corresponding to different reflections. The film deposited at 60°C has the best electrical properties, comparable with those of bulk $\text{Ag}_3\text{IW}_2\text{O}_8$, and these films show an electrical conductivity of $1.6 \times 10^{-5}\ \Omega^{-1}\text{ cm}^{-1}$ at 33°C . 66.30J Diffusion, migration, and displacement of Kf impurities

62163 Diffusion of rubidium ion in pure silver chloride crystals. P.A.Cardegna, A.L.Laskar (Dept. of Phys. & Astron., Clemson Univ., Clemson, SC, USA). *J. Phys. C (GB)*, vol.16, no.11, p.2075-86 (20 April 1983).
The diffusion of ^{86}Rb in AgCl has been measured in the temperature range 184–448 $^\circ\text{C}$ by a tracer-sectioning technique. The transport of Rb^+ is found to proceed by a vacancy mechanism. The temperature dependence of the diffusivity follows a linear Arrhenius law with parameters $D_0 = (1.10_{-0.37}^{+0.56}) \times 10^2\text{ cm}^2\text{ s}^{-1}$ and $H = 1.20 \pm 0.02\text{ eV}$. The data fail to exhibit the continuous positive curvature which is expected on the basis of a non-linear decrease in the Gibbs free energy for Frenkel defect formation with the increase of temperature. It is possible that a strain-induced and temperature-dependent binding energy between the oversized solute ion and a neighbouring vacancy washes out the expected curvature. When the diffusion results of other alkali ions are compared together with the diffusion of Rb^+ in AgCl , it seems likely that the temperature dependence of the motion energy is also to be considered along with those of the formation and solute-vacancy association. (42 refs.)

62164 Effects of impurities on hydrogen permeability through palladium alloy membranes at comparatively high pressures and temperatures. H.Yoshida, S.Konishi, Y.Naruse (Tokai Res. Estab., Japan Atomic Energy Res. Inst., Ibaraki-ken, Japan). *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.429-36 (Feb. 1983).
(International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May–4 June 1982).
The palladium alloy membrane method has been proposed as a means of purifying fusion reactor fuel. The applicability of this method was studied by investigating the effects of impurities on the permeation characteristics of multicomponent palladium alloy membranes. The experiments were performed at comparatively high pressures and temperatures. The hydrogen permeability of commercial Pd-25wt.%(Ag-Au-Ru) was not affected by impurities such as NH_3 , CH_4 , CO , CO_2 and N_2 which are present in hydrogen at low concentrations (10–10000 ppm). However, the permeability deteriorated on contamination with oil vapour but could easily be recovered by baking in air followed by hydrogen reduction. Chemical reactions in the palladium diffuser and the effects of thermal cycling on permeability were also examined. (4 refs.)

62165 ^{51}Cr diffusion in Zr-Sn alloys. L.I.Nicolai, R.Migoni, R.H.de Tendler (Dept. de Materiales, CNEA, Buenos Aires, Argentina). *J. Nucl. Mater. (Netherlands)*, vol.115, no.1, p.39-48 (March 1983).
The volume diffusion of ^{51}Cr in Zr-Sn alloys was measured in coarse-grained polycrystals, using the 'thin film' method. The Sn content in the alloys ranged from 0.39 to 6.7 at.%. In the β -phase, diffusion temperatures were between 982 $^\circ\text{C}$ and 1240 $^\circ\text{C}$. Sn was found to reduce the ^{51}Cr diffusion in the β -phase, the effect being small but well defined. The linear dechancement coefficient b and its temperature dependence were calculated, assuming the formation of Sn-Cr dimers. For the more dilute alloys Q and D_0 were determined and upon application of the Zener theory for D_0 , a negative contribution to the activation entropy was found. In the α -phase where three experiments were done at different temperatures, ^{51}Cr was shown to be a very fast-diffusing solute. No definite correlation with the Sn content was found probably owing to the anisotropy of the α -phase. (27 refs.)

62166 Isotope effect in heat of transport of H, D and T in Nb. M.Sugisaki, S.Mukai, K.Idemitsu, H.Furuya (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan). *J. Nucl. Mater. (Netherlands)*, vol.115, no.1, p.91-4 (March 1983).
The thermal diffusion of hydrogen isotopes, H and D, in Nb was studied at an average temperature of 168 $^\circ\text{C}$. By analyzing the redistribution of hydrogen in Nb on the basis of the irreversible thermodynamics, the heat of transport Q^* was determined for H and D as 9.5 kJ/mol and 16.0 kJ/mol, respectively. The large isotope dependence of Q^* was concluded by comparing these values with the value of 18.8 kJ/mol for T, which was previously reported by the present authors (1982). The coupling coefficients of H and D were also determined from the transient process of redistribution and found to be in good agreement with those based on the Gorsky effect. (10 refs.)

62167 Substitutional-interstitial diffusion with bulk vacancy generation in semiconductors. M.D.Zahari, B.Tuck (Dept. of Electrical & Electronic Engng., Univ. of Nottingham, Nottingham, England). *J. Phys. D (GB)*, vol.16, no.4, p.635-44 (14 April 1983).
A numerical technique is presented which gives a fairly complete description of the substitutional-interstitial diffusion mechanism. The mechanism is modelled directly on the computer without employing the differential equations which have been used by previous workers. Diffusion of the interstitial component of a diffusing impurity is taken into account together with self-diffusion by atoms of the host crystal and vacancy generation within the bulk of the crystal. The computed diffusion profiles compare well with experimental profiles found in certain semiconductor systems. The program is used to reproduce as closely as possible experimental diffusion profiles of silver in the III-V semiconductors GaAs and InP. The fitting parameters all represent physical quantities and the optimum values obtained are shown to be reasonable for the semiconductors concerned. (22 refs.)

62168 Kinetic enrichment of hydrogen at interfaces and voids by dislocation sweep-in of hydrogen. S.V.Nair, R.R.Jensen, J.K.Tien (Henry Krumb School of Mines, Columbia Univ., New York, NY, USA). *Metall. Trans. A (USA)*, vol.14A, no.3, p.385-93 (March 1983).
A rigorous treatment is presented to answer the question of whether the dislocation sweep-in of hydrogen can result in enrichment of hydrogen at voids and boundaries. It is concluded that significant enrichment can occur in both low and high hydrogen diffusivity situations whether the enrichment is contributed by a dislocation annihilation process or by stripping of hydrogen atoms from dislocations by the internal traps. The model presented is based on enrichment controlled by long-range diffusion. It calculates the diffusion leakage current for the case where unsaturated trap interfaces simultaneously fill and leak hydrogen atoms into the matrix by diffusion, and compares this amount with the arrival current of hydrogen to the traps by dislocation sweep-in. The relative magnitudes of the two currents are found to depend on appropriate, calculable time constant values. These values are evaluated for physical situations of interest. (30 refs.)

62169 Tritium permeability and pressure dependence of 304L stainless steel in the temperature range 723 to 1023K. M.Matsuyama (Tritium Res. Center, Toyama Univ., Toyama, Japan), J.D.Redman. *Metall. Trans. A (USA)*, vol.14A, no.3, p.498-500 (March 1983).
Tritium permeation through austenitic stainless steel was investigated. An Arrhenius-type plot for the tritium permeability is presented. The permeability constant, DK_0 , and activation energy for permeation of tritium were both higher than values measured by Bell et al. (1979) for other austenitic alloys. However, these results are consistent with the trend reported by Bell et al. in that both the permeability constant and the activation energy increase with decreasing nickel content of the austenitic alloys. (15 refs.)

62170 SIMS analysis of the impurity diffusion of In in Cu. W.Gust, C.Ostertag, B.Predel, U.Roll (Inst. fur Metallkunde, Max-Planck-Inst. fur Metallforschung, Stuttgart, Germany), A.Lodding, H.Odelius. *Philos. Mag. A (GB)*, vol.47, no.3, p.395-406 (March 1983).
Secondary-ion mass spectrometry (SIMS) has been used to study the bulk impurity diffusion of indium in monocrystalline copper. Sixteen samples were annealed at temperatures ranging from the vicinity of the melting point down to 602K, i.e. to regions relevant in grain-boundary diffusion. The diffusion coefficients D obtained extend over a very wide range: between 3.3×10^{-12} and $6.0 \times 10^{-21}\text{ m}^2\text{ s}^{-1}$. The results agree well with earlier data, obtained in a more restricted temperature range. Of several evaluations of the raw SIMS data, that based on the matrix-normalized $^{115}\text{In}^+$ signal is found to yield the most accurate Arrhenius parameters for the single-vacancy mechanism in the low-temperature region: $D_0^{\text{IV}} = 0.219(\pm 0.386, -0.140) \times 10^{-4}\text{ m}^2\text{ s}^{-1}$ and $Q^{\text{IV}} = 178.0 \pm 6.0\text{ kJ mol}^{-1}$. These results are compared with other values in the literature and discussed. (14 refs.)

62171 Hydrogen permeability of palladium-platinum alloys. Yu.N.Guk, G.E.Kagan, V.V.Lobanov, E.S.Levin, P.V.Gel'd. *Russ. Metall. (GB)*, no.6, p.187-9 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.191-4 (1981).

An important application of Pd-Pt alloys is in manufacturing thin membranes required in the production of extra-pure hydrogen. The coefficients of hydrogen penetration were examined for the temperature range 300-800°C in palladium alloys containing 4.0, 10.4, 25.7, 40.0, 50.2, 65.7 and 75.5 at.% Pt. The hydrogen permeability of Pd-Pt alloys with 4.0-7.5 at.% Pt decreases with increasing Pt concentration, and at 300-650°C the hydrogen permeability is considerably lower than it is for palladium. The hydrogen permeability in the range 700-800°C for Pd-Pt alloys with up to 40 at.% Pt is close to that of palladium. With increasing temperature of the Pd-Pt alloys the hydrogen permeability changes in a complex manner and above 500-700°C there is a deviation from the initial exponential dependence. (8 refs.)

62172 Interpretation of carbon diffusivity in Fe-Ni alloys. D.Farkas (Dept. of Materials Engrg., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).

Scr. Metall. (USA), vol.17, no.3, p.265-8 (March 1983). In the framework of the theory of absolute reaction rates a diffusion coefficient is obtained that is proportional to the product of activity coefficient and the square of the lattice parameter. This product can be calculated and it has maximum near 70% Ni, like the activities. The explanation of the observed behaviour of C diffusivities has to be found in the analysis of the activation energies and the activity of the activated complexes, as well as in the fraction of C that is trapped in low energy sites with more Fe atoms. (3 refs.)

62173 The influence of pressure on indium diffusion along single tin-germanium interphase boundaries. B.B.Straumal, L.M.Klinger, L.S.Shvindlerman (Inst. of Solid State Phys., Acad. of Sci., Chernogolovka, USSR).

Scr. Metall. (USA), vol.17, no.3, p.275-9 (March 1983). It is shown that the activation volume of diffusion along interphase boundaries is much higher than the activation volume typical of vacancy single diffusion mechanism. This effect is most pronounced for special boundaries, and with the increase in the interface perfection (with decreasing reciprocal density of coincidence sites Σ) the activation volume (and the activation energy) rises. (6 refs.)

62174 Influence of the internal electric field on the migration of substitutional impurities in diamond-structure semiconductors. M.I.Vasilevskii, V.A.Murav'ev, V.A.Pantelev (Physicotech. Res. Inst., N.I. Lobachevskii State Univ., Gorki, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1468-70 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2589-94 (Sept. 1982). [received: April 1983]

The influence of an electric field on diffusion is studied by the method of many-particle correlation function chains. A vacancy mechanism of impurity diffusion is considered, which involves a series of successive events of impurity-vacancy complex formation, reorientation, and disintegration. The basic physical idea is that the field affects the frequencies of the elementary transitions of charged vacancies. By solving the transport equations for the many-particle correlation functions of defects, an expression is derived for the mobility of an impurity ion in terms of these frequencies. It is shown that, owing to correlation effects, the relation between the mobility and the diffusion coefficient of an impurity ion differs from the customary Einstein relation: moreover, if the reorientation probability for impurity-vacancy complexes is large compared with the disintegration probability, the sign of the mobility is anomalous (opposite to that of the ion charge), so that the drift of impurity ions in the internal field does not accelerate, but retards, the diffusion. The redistribution of vacancies in the field is also discussed; it causes a concentration dependence of the impurity diffusion coefficient and mobility. (11 refs.)

62175 Review on lattice diffusion of substitutional impurities in iron. A summary report. H.Oikawa (Dept. of Materials Sci., Tohoku Univ., Sendai, Japan).

Technol. Rep. Tohoku Univ. (Japan), vol.47, no.2, p.215-24 (1982). In English.

Diffusion data in the α - δ and the γ phases of iron have been critically assessed and the diffusion parameters, D_0 and Q , were recalculated based on individual datum points for 25 substitutional impurities: Ag, Al, As, Au, Be, Co, Cr, Cu, Hf, Mn, Mo, Nb, Ni, P, Pd, Pt, S, Sb, Se, Si, Sn, Ti, V, W, and Zn. Regularities with respect to the atomic number of impurity, X , have been noted in the ratio, D_X/D_{Fe} , and the activation energy difference, $Q_X - Q_{Fe}$. (75 refs.)

62176 Impurity diffusion in amorphous silicon and its implications for solar cells. S.Kalbitzer, M.Reinelt, W.Stolz (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).

Fourth E.C. Photovoltaic Solar Energy Conference, Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1059-62.

Diffusion coefficients of a variety of impurities from different columns of the atomic table have been measured by high resolution nuclear spectroscopy. The relevance of the resulting distribution lengths with respect to solar cell properties is discussed for short time deposition processes at elevated temperatures and long time operation at ambient temperatures. 62177 Grain boundary diffusion in columnar structure polycrystalline materials. H.F.Ragaie (Electronics & Computer Dept., Ain Shams Univ., Cairo, Egypt).

Electron. Lett. (GB), vol.19, no.8, p.294-5 (14 April 1983). A simple but rigorous solution for the problem of grain boundary diffusion in columnar structure semi-infinite polycrystalline materials is proposed. The method is advantageous over other known methods in that it can be easily extended to media of finite thickness. (4 refs.)

62178 Calculations of phenomenological coefficients for matter transport by the matrix method of random walk theory. Y.Okamura, A.R.Allnatt (Dept. of Chem., Univ. of Western Ontario, London, Ontario, Canada).

J. Phys. C (GB), vol.16, no.10, p.1841-62 (10 April 1983). Linear response formulae for the phenomenological coefficients L_{AA} , L_{AB} and L_{BB} for matter transport by single vacancies in a very dilute isotropic alloy of solute B in solvent A are studied by the matrix method of random walk theory familiar in the calculation of impurity correlation factors. A symmetry classification of vacancy jumps based on symmetry with respect to the diffusion axis is introduced and applied to the linear response formulae in order to reduce them to compact forms. For typical models these forms contain a small number of functions K_{ij} which are linear combinations of vacancy migration Green functions for paths between sites of symmetry types i and j that do not pass through the impurity. The K_{ij} are calculated by inversion of a certain matrix of jump probabilities. Detailed calculations are made for models with first- and second-nearest-neighbour vacancy-impurity interactions for BCC, FCC and diamond lattices. The calculations of L_{AB} and L_{AA} are seen to be straightforward extensions of those already familiar in the calculation of L_{BB} and the impurity correlation factor. This suggests that extensions to other crystal structures and migration mechanisms can be made. (23 refs.)

62179 An exact solution to diffusion via the vacancy mechanism. L.Gunther (Phys. Dept., Tufts Univ., Medford, MA, USA), B.Gralla.

J. Phys. C (GB), vol.16, no.10, p.1863-74 (10 April 1983).

The authors have obtained an exact solution to the problem of diffusion by the vacancy mechanism in the sudden jump approximation, using the set of rate equations developed by Dobar-Ure and Flinn (1973) for self-diffusion. They have extended the equations and solution to the case of impurity diffusion via vacancies. The solutions are valid for all times and also yield the Bardeen-Herring correlation factor f in terms of an integral. Although numerical solutions have been obtained only for the square lattice in two dimensions, the method is easily extendable to other two-dimensional lattices and lattices of higher or lower dimensionality. (38 refs.)

62180 A mathematical analysis of diffusion in dislocations. III. Diffusion in a dislocation array with diffusion zone overlap. A.D.Le Claire, A.Rabinovich (Materials Dev. Div., AERE, Harwell, England).

J. Phys. C (GB), vol.16, no.11, p.2087-104 (20 April 1983).

For $pt \ll$ see *ibid.*, vol.15, p.3445 (1982). The authors consider diffusion from a surface $y=0$ into a solid containing a regular array of d dislocations per unit area, all normal to the surface and each represented as a pipe of radius a within which the diffusion coefficient D' is very much greater than that, D , for diffusion in a regular crystal. They calculate the mean concentrations $\langle c(y) \rangle$ at depths y , as determined in conventional sectioning experiments, for both constant concentration and thin-finite-source conditions at $y=0$. $\langle c \rangle$ is evaluated as a function of $\eta = y/(Dt)^{1/2}$, $\alpha = a/(Dt)^{1/2}$, $\Delta = D'/D$, $\epsilon = \pi a^2 d$ and of ϵ/α , the ratio of the mean diffusion length, $(Dt)^{1/2}$, to the effective half-spacing between dislocations, $(\pi d)^{-1/2}$. Full account is taken, through an appropriate Wigner-Seitz-like boundary condition, of the effects of the mutual overlap of the diffusion zones around dislocations. For $\epsilon/\alpha \leq 1$, values of $\langle c \rangle$ do not differ by more than a few per cent from those previously calculated by the authors for well spaced non-interacting dislocations; for $\epsilon/\alpha \geq 0.4$ the two solutions are numerically identical. As ϵ/α increases above one the effects of overlap rapidly become increasingly important. They examine the nature of the penetration plots, $\log \langle c \rangle$ versus y^2 , and the effective diffusion coefficients, D_{eff} , deduced from them. The case $\epsilon/\alpha \leq 1$ was discussed previously by the authors. The plots show maximum curvature around $\epsilon/\alpha \approx 5$ but would be difficult experimentally to distinguish from linear when $\epsilon/\alpha \geq 10$. For this range D_{eff} is found to be closely represented by the Hart relation, $D_{eff} = D(1 + \pi a^2 d (\Delta - 1))$, the condition of validity of which can now be specified more precisely than heretofore. (12 refs.)

62181 Some remarks on the carbon atoms pairs migrational relation in α -Fe-C. G.Haneczok, R.Kuska, J.W.Moron, J.Rasek (Inst. of Phys. & Chem. of Metals, Silesian Univ., Katowice, Poland).

Scr. Metall. (USA), vol.17, no.3, p.303-8 (March 1983).

The problem of the existence of directionally ordering pairs of interstitial atoms in BCC metals is considered. Results obtained for α -Fe-C using magnetic permeability disaccommodation measurements (MPD) are reviewed. Arrhenius law parameters for the C-C pairs in α -Fe obtained by the MPD method are presented. Theoretical investigations on crystallographic configuration, binding energy and relaxational properties of interstitial atom pairs are discussed. (35 refs.)

62182 Growth of titanium silicide on ion-implanted silicon. P.Revesz, J.Gyimesi, E.Zsoldos (Central Res. Inst. for Phys., Budapest, Hungary).

J. Appl. Phys. (USA), vol.54, no.4, p.1860-4 (April 1983).

Silicon samples implanted with high doses of ^{121}Sb , ^{75}As , ^{31}P , ^{16}O , and ^{40}Ar prior to Ti evaporation were studied to measure the growth of Ti-silicide layers. The annealing behavior of these samples was investigated by four-point probe measurement, Rutherford backscattering, and by X-ray diffraction. The samples implanted with Sb, As, and P atoms enabled the growth of TiSi₂ to be observed, though its final thickness was less than half when compared to that of the nonimplanted samples. Simultaneously with the diffusing-out atoms of Sb, during annealing, segregation of Sb atoms takes place at the TiSi₂/Ti interface and at the Ti surface. Using a simple model for the out-diffusion of Sb atoms, the activation energy of the diffusion coefficient of Sb in the Ti silicide was determined, giving a value of $E_a = 1.9$ eV. During out-diffusion, As atoms tend to be distributed homogeneously in the silicide layer. With Ar- and O-implanted samples, precipitation of Ti atoms can be observed at the implantation depth, and at higher annealing temperatures, the metal layer flakes off the sample. A simple model is given to explain this behavior. X-ray diffraction measurements of these samples showed the presence of the unstable TiSi phase, but no trace of the TiSi₂ phase was found after annealing at 700°C. (13 refs.)

62183 Application of the method of time-lag analysis to the study of diffusion in solids of nonhomogeneous macroscopic structure. C.Savvakis, J.H.Petropoulos (Phys. Chem. Lab., Demokritos Nuclear Res. Center, Aghia Paraskevi, Athens, Greece).

J. Phys. Chem. (USA), vol.86, no.26, p.5128-33 (23 Dec. 1982).

The study of the anomalous diffusion of N_2 in microporous graphite compacts is investigated by systematically varying the mode of compaction. It is shown that the results of the method of time-lag analysis, can be successfully correlated with the axial nonhomogeneity of the macroscopic structure of the compacts through a suitable physical model. Previous conclusions about the nature of 'non-Fickian' diffusion of gases in microporous compacts are confirmed and extended. (15 refs.)

62184 Solid state SiC/Ni alloy reaction. M.R.Jackson, R.L.Mehan, A.M.Davis, E.L.Hall (General Electric Corporate Res. & Dev., Schenectady, NY, USA).

Metall. Trans. A (USA), vol.14A, no.3, p.355-64 (March 1983).

The solid state reaction between silicon carbide and a model superalloy consisting of 70 at. pct Ni, 20 at. pct Cr, and 10 at. pct Al was studied between 700°C and 1150°C for times ranging from 10' hours to 330 hours. Reaction couples consisting of SiC/Ni, SiC/Cr, and SiC/NiCr were also studied. The reactions were carried out in air with the materials, in the shape of discs, maintained in contact under a pressure of 7 MPa. A reaction was detected with SiC and model alloy at all temperatures studied, and the reaction was diffusion controlled with an activation energy of 184 kJ/mole. In the ceramic the reaction was dominated by the diffusion of Ni into the ceramic forming a banded structure consisting of alternating layers of δ -Ni₃Si and a two phase mixture of graphite and δ . On the metal side, the reaction was very dependent on the presence of alloying elements, with pure Ni reacting to the greatest extent, followed by the binary NiCr alloy, and finally by NiCrAl. The growth and presence of the phases detected in these reactions is consistent with phase equilibria concepts. (22 refs.)

62185 Analysis of diffusion mechanisms in thin polycrystalline Au-Ag films using Auger electron spectroscopy. A.Bukaluk (Inst. Matematyki i Fizyki, Akad. Tech. Rolnicza w Bydgoszczy, Bydgoszcz, Poland).

Surf. & Interface Anal. (GB), vol.5, no.1, p.20-7 (Feb. 1983).

The diffusion process of silver through gold polycrystalline films 1000 Å thick for different heating times and different temperatures was studied. Auger electron spectroscopy (AES) with simultaneous argon ion sputtering was used to obtain the composition profiles of silver diffusing through gold thin films. The interdiffusion coefficients were extracted from the diffusion profiles using the rate of decrease of the concentration gradient at the Au-Ag film interface (the 'centre gradient' method) and the rate of rise of Ag concentration plateau in the Au film (the 'plateau rise' method). The grain boundary diffusion coefficients have been evaluated by means of the depth profile analysis, based on the Whipple model. The activation energies of each mechanism have been determined from the Arrhenius plots. (26 refs.)

62186 Reactivity of cobalt, chromium, indium, magnesium, manganese, antimony and samarium thin films in couples with other metal films at room temperature. Z.Marinovic, V.Simic (Inst. of Phys., Belgrade, Yugoslavia).

Thin Solid Films (Switzerland), vol.101, no.4, p.L37-40 (25 March 1983).

Studies the phenomenon of compound formation through the spontaneous reaction of two different thin metal films at room temperature. The thin film couples were prepared by vacuum evaporation, and X-ray diffraction was used to examine the samples for compound formation. It was found that most of the compounds were formed in couples consisting of a component of low melting point (below 450°C) and a component of high melting point (850-1100°C). The metals of medium melting point (600-700°C) very rarely formed compounds, with either metals of low melting point (below 450°C) or those of very high melting point (up to 1500°C). (14 refs.)

62187 Thermal diffusivity of pyrotechnic mixtures of tungsten and potassium dichromate by thermal analysis. T.Boddington, P.G.Laye, J.Tipping (Dept. of Phys. Chem., Univ. of Leeds, Leeds, England).

Combust. & Flame (USA), vol.50, no.2, p.139-51 (March 1983).

Two techniques have been developed to measure the thermal diffusivity of powders pressed into the form of cylinders. Both techniques use a modified commercial differential thermal analysis apparatus to monitor the temperature gradient inside the cylinder when the ambient temperature is increased either linearly with time or suddenly from one constant value to another. The theory is elaborated and graphs are presented which allow the thermal diffusivity to be obtained for a variety of cylinder geometries. Both techniques have been used to measure the thermal diffusivity of pyrotechnic mixtures of tungsten and potassium dichromate. (4 refs.)

62188 Thermal conductivity of stoichiometric (Pu, Nd)O₂ and (Pu, Y)O₂ solid solutions. S.Fukushima, T.Ohmichi, A.Maeda, M.Handa (JAERI, Ibaraki, Japan).

J. Nucl. Mater. (Netherlands), vol.114, no.2-3, p.260-6 (Feb. 1983).

The thermal conductivities of stoichiometric (Pu, R)O₂ solid solutions containing RO_{1.5} (R = Nd and Y) up to 10 mol.% were determined by the laser flash

method in the temperature range 700-1400K. The thermal conductivities for all solid solutions satisfied the phonon conduction equation $K = (A + BT)^{-1}$ within $\pm 6\%$. The lattice defect thermal resistivities ($= A$) increased gradually with the neodymium or yttrium content, while the intrinsic lattice thermal resistivities ($= BT$) were nearly equal to that measured for PuO₂. The measured thermal conductivities were consistent with the results of the lattice defect model calculation in which Pu⁴⁺, Pu³⁺ and R³⁺ ions were considered as phonon scattering centers. The lattice strain parameters $\epsilon = 85$ and 93 were obtained for (Pu, Nd)O₂ and (Pu, Y)O₂ solid solutions, respectively. (14 refs.)

62189 Thermal conductivity of near-stoichiometric (U,Nd)O₂, (U,Sm)O₂ and (U,Eu)O₂ solid solutions. S.Fukushima, T.Ohmichi, A.Maeda, M.Handa (JAERI, Ibaraki, Japan).

J. Nucl. Mater. (Netherlands), vol.114, no.2-3, p.312-25 (Feb. 1983).

The thermal conductivities of near-stoichiometric (U,R)O₂ solid solutions (R = Nd, Sm and Eu) containing RO_{1.5} up to 15 mol.% were determined in the temperature range 700-2000K by the measurement of thermal diffusivity. The thermal conductivities satisfied the phonon conduction equation $K = (A + BT)^{-1}$ within $\pm 5\%$. The constant A corresponding to the lattice defect thermal resistivity increased linearly with the rare earth element content, while the temperature coefficient B was almost independent of it. The change in A with the rare earth element content increased in order of (U,Eu)O₂, (U,Sm)O₂ and (U,Nd)O₂ solid solutions. The increase of A was explained reasonably by the lattice defect model considering U⁴⁺, U³⁺ and R³⁺ ions in the solid solutions as phonon scattering centers, using a common value for the strain parameter ($\epsilon = 110$). For all solid solutions, the lattice strain effect on the lattice defect thermal resistivities was much larger than the mass effect. In addition, the effect of U³⁺ ions on the lattice defect thermal resistivity caused by the lattice strain effect was larger than that of R³⁺ ions. (20 refs.)

62190 Thermal conductivity of (Pu_{1-x}Nd_x)O_{2-y} and (Pu_{1-x}Y_x)O_{2-y} solid solutions. S.Fukushima, T.Ohmichi, A.Maeda, M.Handa (JAERI, Ibaraki, Japan).

J. Nucl. Mater. (Netherlands), vol.115, no.1, p.118-27 (March 1983).

The thermal conductivities of (Pu_{1-x}R_x)O_{2-y} solid solutions (R = Nd and Y) containing RO_{1.5} up to 10 mol.% were determined in the temperature range 700-1450K from thermal diffusivities measured by the laser flash method. The thermal conductivities satisfied the phonon conduction equation $K = (A + BT)^{-1}$ within $\pm 7\%$. The values of A, corresponding to the lattice defect thermal resistivity, increased linearly with the neodymium or yttrium content, while those of B were nearly constant. The increasing rate of A for (Pu, Nd)O_{2-y} solid solutions was slightly larger than that for (Pu, Y)O_{2-y}. These increases were reasonably explained by the lattice defect model in which Pu⁴⁺, R³⁺, O²⁻ ions and oxygen vacancy in the solid solutions were considered as phonon scattering centers. For both solid solutions, the lattice strain effects on the lattice defect thermal resistivities were in preference to the mass effects. In addition, the stoichiometry effects on the additional defect thermal resistivities were about 1.3 times larger than the cation effects. (29 refs.)

62191 The effect of phonon-grain boundary scattering, doping and alloying on the lattice thermal conductivity of lead telluride. C.M.Bhandari, D.M.Rowe (Dept. of Phys., Electronics & Electrical Engng., Univ. of Wales Inst. of Sci. & Technol., Cardiff, Wales).

J. Phys. D (GB), vol.16, no.4, p.L75-7 (14 April 1983).

The lattice thermal conductivity of lead telluride has been investigated theoretically as a function of grain size, level of doping and alloying. Although there is some difficulty in making predictions of the precise dependence of the lattice thermal conductivity on these parameters, it is possible to indicate the range over which the results may vary. It is concluded that for moderately doped material having a grain size of 1 μ m the reduction in lattice thermal conductivity would lie in the range 4-6% for unalloyed lead telluride and 11-13% for highly disordered alloys. (7 refs.)

62192 Soliton-phonon scattering in TMMC and DMMC. J.A.H.M.Buys, W.J.M.de Jonge (Dept. of Phys., Eindhoven Univ. of Technol., Eindhoven, Netherlands).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1209-10 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The magnetic field dependence of the thermal conductivity of the quasi 1d Heisenberg antiferromagnets TMMC and DMMC is measured between 1.5 and 7K and in fields up to 90 kOe. In the paramagnetic phase the data can be interpreted very well by soliton-phonon scattering. (6 refs.)

62193 Thermal conductivity of germanium containing dislocations at low temperatures. M.A.Ansari, A.Kumar, B.K.Srivastava (Dept. of Phys., Indian Inst. of Technol., Kharagpur, India).

Phys. Status Solidi b (Germany), vol.116, no.1, p.163-7 (1 March 1983).

To study the frequency dependence of the phonon-dislocation scattering, the phonon conductivity of germanium with dislocations is analysed using Holland's model (1963) and Kumar and Sinha's relaxation time for the phonon-dislocation scattering processes. A reasonably good agreement is observed between present theory and experimental data of Sato and Sumino (1974). (14 refs.)

62194 An ion-implanted resistor as thermal transient sensor for the determination of the thermal diffusivity in silicon. P.Turkes (Inst. of Angewandte Phys., Univ. Erlangen-Nurnberg, Erlangen, Germany).

Phys. Status Solidi a (Germany), vol.75, no.2, p.519-23 (16 Feb. 1983).

A high accuracy thermal transient sensor for investigations of doping influences on the thermal diffusivity in silicon is developed. The sensor is tested in a low doped n-type sample and in an intermediate doped p-type sample. In measurements on the p-type sample, doping effects are observable. (14 refs.)

67.00 QUANTUM FLUIDS AND SOLIDS; LIQUID AND SOLID HELIUM

(see also 05.30 Quantum statistical mechanics)

67.40 BOSON DEGENERACY AND SUPERFLUIDITY OF HELIUM-4

62195 Comments on 'Coupling between pressure and temperature amplitude in waves of second sound in liquid helium' [by Hofmann, A., Keck, K., and Schubert, G.V., *Z. Phys.*, **231**, 177 (1970)]. S. Garrett (Dept. of Phys., Naval Postgraduate School, Monterey, CA, USA).

Z. Phys. B (Germany), vol.50, no.3, p.275-6 (1983).

In Section V of the article by Hofmann et al., the authors claim to have applied the reciprocity method to the calibration of thermal transducers in superfluid helium. The author here gives reasons for believing that the expressions for transducer sensitivity, M_2 , and source strength, S , have absolutely nothing to do with the use of acoustical reciprocity, and are the result of a misunderstanding of the foundations of the reciprocity method. (2 refs.)

62196 Calibration of second sound transducers. A response on the comments of S. Garrett. A. Hofmann (Inst. fur Tech. Phys., Kernforschungszentrum, Karlsruhe, Germany).

Z. Phys. B (Germany), vol.50, no.3, p.277-9 (1983).

The authors previously described (see *Z. Phys.*, vol.231, p.177, 1970) a method of calibrating second sound transducers operated in liquid helium. This method was derived in analogy to the reciprocity technique applied to first sound. S. Garrett, however (see *ibid.*, vol.50, p.275, 1983), asserts that this calibration method 'has absolutely nothing to do with the use of acoustical reciprocity'. Because of the orthogonality of the two views the author would like to describe in detail his derivation of the given formalism which he believes to be correct. (2 refs.)

62197 Heat transfer with He II noiseless film boiling. Ye.V. Ametistov (Moscow Power Engng. Inst., Moscow, USSR).

Cryogenics (GB), vol.23, no.4, p.179-84 (April 1983).

An analytical heat transfer process description of noiseless superfluid helium films boiling on heating surfaces of different geometries is presented. Final calculation relationships stipulate the knowledge of the heat flux density magnitude at the interface He II-vapour. An approach to the analytical calculation of the boundary thermal resistance value to heat transfer at the interface on the liquid side has been suggested, the latter permitting theoretical calculations of the heat flux density on this boundary in the long term. The comparison of recommended calculation relations on the transfer intensity with He II noiseless film boiling demonstrates their satisfactory agreement with all experimental results available in the literature. Criteria are given which determine the limits to which the obtained calculation relations can be applied. (16 refs.)

62198 Heat transfer to helium-I during different boiling regimes at high centrifugal accelerations. Yu.A. Kirichenko, S.M. Kozlov, N.M. Levchenko (Phys.-Tech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR).

Cryogenics (GB), vol.23, no.4, p.217-19 (April 1983).

Heat transfer during nucleate and film boiling of helium and also the boiling crises up to relative accelerations of $(1 \div 2) \times 10^3$ have been investigated. The heat transfer surface was a flat copper heater. The heat transfer during nucleate boiling proved to be independent of the relative accelerations. For film boiling, it was found that $\alpha \sim \eta^{1/3}$. The dependence of the peak nucleate boiling heat flux and the minimum film boiling flux on the relative acceleration is non-monotonic. (5 refs.)

62199 Influence of surface characteristics of solids on the Kapitza resistance. G. Dharmadurai (Reactor Res. Centre, Kalpakkam, Nadu, India).

Physica B & C (Netherlands), vol.115 B+C, no.2, p.229-32 (Jan. 1983).

The authors examine the predictions of the acoustic mismatch model for the Kapitza boundary thermal resistance between solids and liquid helium in the light of the observation that the characteristic surface vibration temperatures of solids are less than their bulk vibration temperatures. They find that the above observation, in addition to a larger effective area arising from the surface structure in the solids, leads to an order of magnitude decrease in the Kapitza resistance, which significantly reduces the prevailing discrepancy between theory and experiment. (12 refs.)

62200 Superflows and superfluidity. E.B. Sonin (A.F. Ioffe Physicotech. Inst., Acad. of Sci. of the USSR, Leningrad, USSR).

Sov. Phys.-Usp. (USA), vol.25, no.6, p.409-30 (June 1982). Translation of: *Usp. Fiz. Nauk (USSR)*, vol.137, no.2, p.267-304 (June 1982). [received: April 1983]

The basic concepts of the theory of mass superflows in a superfluid are presented. The stability of such flows with respect to the creation and growth of linear defects (superfluid vortices), the relationship between superflows and the existence of long-range order, and the possible occurrence of persistent flows in one- and two-dimensional systems are discussed. Some analogs of the mass superflows in a superfluid are also examined: spin superflows in magnetically ordered systems having an easy-plane anisotropy and the current states of a Bose condensate of electron-hole pairs. The physical meaning of such 'flows' is discussed, and a theory for their stability is derived from the calculated probability for the creation of the linear defects which are analogs of superfluid vortices. There is a discussion of the applicability of the theory of spin superflows to several experiments on the magnetic properties of the A phase of superfluid helium-3 and to a possibility which follows from this theory: that domain walls might be generated in the interior of a sample of an easy-plane magnetically ordered material and that the motion of these walls might be controlled by fields applied to the surface of the sample. (105 refs.)

62201 Cooling liquid ^3He to around 100 μK . A.M. Guenault, V. Keith, C.J. Kennedy, I.E. Miller, G.R. Pickett (Dept. of Phys., Univ. of Lancaster, Lancaster, England).

Nature (GB), vol.302, no.5910, p.695-6 (21 April 1983).

An immersed-refrigerant cooling method was used to cool a sample of moderately pure ^3He . In the preliminary experiment, an extremely low helium temperature was achieved, certainly below 120 μK , at which temperature the superfluid B phase is so far below its transition temperature that the vibrating wire viscometer is essentially unable to detect the presence of any normal fluid component. In this regime the authors hope to be able to investigate any

interaction between the wire and the stiffness of the superfluid texture. (5 refs.)

62202 Effect of gap distortion on the field splitting of collective modes in superfluid $^3\text{He-B}$. N. Schopohl (Inst. fur Festkörperforschung, KFA Jülich, Jülich, Germany), M. Warnke, L. Tewordt.

Phys. Rev. Lett. (USA), vol.50, no.14, p.1066-9 (4 April 1983).

The field splitting of the real squashing, $J=2$, mode in $^3\text{He-B}$ is shown to become highly nonlinear at large fields as a result of the ellipsoidal deformation of the energy gap. This leads to crossings of the $J_z = +1$ and $J_z = 0$ levels with the $J_z = +2$ level. The crossing points depend sensitively on the couplings between the $J=2$, 1, and 0 modes. The theory is in good agreement with the observed field evolution and level crossing as measured recently by Shivaram et al. (1983). (15 refs.)

62203 Nonlinear Zeeman shifts in the collective-mode spectrum of $^3\text{He-B}$. B.S. Shivaram, M.W. Meisel, B.K. Sarma, W.P. Halperin, J.B. Ketterson (Dept. of Phys. & Astron., Northwestern Univ., Evanston, IL, USA).

Phys. Rev. Lett. (USA), vol.50, no.14, p.1070-2 (4 April 1983).

Zeeman shifts in one of the $J=2$ order-parameter collective-mode multiplets in $^3\text{He-B}$ have been measured in magnetic fields up to 0.16 T. The observed shifts are extremely nonlinear at higher fields. The extent of nonlinearity decreases as $T/T_c \rightarrow 0$ and for a given T/T_c is more predominant at lower pressures and/or frequencies. The observed effects can be attributed to the distortion of the B-phase energy gap in the presence of a magnetic field as suggested by Schopohl, Warnke, and Tewordt (1983). (19 refs.)

Superflows and superfluidity See Entry 62200

67.60 MIXED SYSTEMS; LIQUID HELIUM 3-4 MIXTURES

62204 Thermal diffusion measurements near the liquid-vapor critical point. L.H. Cohen, M.L. Dings, H. Meyer (Dept. of Phys., Duke Univ., Durham, NC, USA).

Phys. Rev. Lett. (USA), vol.50, no.14, p.1058-61 (4 April 1983).

The authors report measurements of the density and temperature gradients in $^3\text{He-}^4\text{He}$ mixtures near their liquid-vapor critical point, as induced by a heat flux. From these they deduce the thermal diffusion ratio k_T and the conductivity κ . They find that κ_T and κ diverge with respective effective exponents $\phi \approx 1.2$ and $\psi \approx 0.6$. Both of these results are in contradiction with the asymptotic predictions for binary mixtures and are discussed in the light of the hydrodynamic transport equations. (20 refs.)

67.70 FILMS

(inc. physical adsorption)

62205 The crucial role of the vapour for the speed and attenuation of isothermal third sound in unsaturated helium films. G. Bannink, M.G.M. Brocken, I.van An del, H.van Beelen (Kamerlingh Onnes Lab., Rijksuniversiteit, Leiden, Leiden, Netherlands).

Physica B & C (Netherlands), vol.115 B+C, no.3, p.376-80 (March 1983).

A thin-film oscillator is used to study superfluidity of ^4He films (thickness range 1.4-5.0 nm). Data on isothermal Helmholtz oscillations and standing third-sound waves are compared with each other, using a two-fluid description. It is demonstrated how the exchange of mass between film and vapor reduces the isothermal speed of third sound in confined geometries considerably. Absolute values of the areal superfluid density ρ_{s2} have been obtained. (7 refs.)

67.80 SOLID HELIUM AND RELATED QUANTUM CRYSTALS

62206 Observation, close to roughening transition of critical-slowing-down. L. Puech, D. Hebral, D. Thoulouze, B. Castaing (CNRS, Grenoble, France).

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.1, p.19-22 (10 Jan. 1983). In French.

The times necessary to recover the stable size of a facet of a ^4He crystal in a slow growing process, close to the roughening transition of the facet ($T_R \approx 215$ mK) have been measured. These times exhibit a critical slowing down from 2 min. far from this transition to 44 min. to within several millikelvins of the transition. (10 refs.)

62207 Shape of crystals at low temperatures: absence of quantum roughening. D.S. Fisher (Bell Labs, Murray Hill, NJ, USA), J.D. Weeks.

Phys. Rev. Lett. (USA), vol.50, no.14, p.1077-80 (4 April 1983).

It has been suggested that quantum fluctuations would cause the interface of quantum crystals such as ^4He to be rough even at $T=0$. It is shown quite generally that this is incorrect: All stable faces must have nonzero roughening temperatures. This implies that the equilibrium shape of all crystals (classical or quantum) is faceted at sufficiently low temperatures. A criterion for estimating the roughening temperature of various crystal faces is discussed. (13 refs.)

(inc. surface tension, capillarity, wetting and related phenomena)

62208 A new method for computing surface tension using a drop of liquid. J.G.Powles, R.F.Fowler, W.A.B.Evans (Phys. Labs., Univ. of Kent, Canterbury, England).

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.289-92 (8 April 1983).

In the simulation of a liquid drop it is expensive to calculate the excess pressure and obtain the surface tension by the Laplace formula. The authors use the Kelvin formula which only requires the vapour density, or at most the virial pressure. Some results are given for a Lennard-Jones 12-6 fluid. (19 refs.)

62209 Surface tension and thickness of argon liquid/vapor interface. V.G.Baidakov (Physicotech. Branch for Problems in Power Engng., Acad. of Sci., Sverdlovsk, USSR), V.P.Skripov.

Colloid J. USSR (USA), vol.44, no.3, p.370-6 (May-June 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.3, p.409-16 (May-June 1982). [received: Feb. 1983]

The capillary constant has been measured and the surface tension σ of argon has been calculated in the temperature interval 85-143K. The values obtained for the surface tension have been compared with values of σ calculated by the use of different statistical theories. On the basis of the experimental data on surface tension and the thermodynamic properties of argon in the metastable region, by the use of the theory of inhomogeneous systems of van der Waals (1927) and Cahn-Hilliard (1958) and calculations have been performed to determine the pressure tensor and the density profile in the transition layer, the effective thickness of the layer, and the distance between the tension surface and the equimolecular interface. (22 refs.)

62210 Changes in contact angle during the process of capillary rise. V.V.Berezkin, N.V.Churayev (Inst. of Phys. Chem., Acad. of Sci., USSR).

Colloid J. USSR (USA), vol.44, no.3, p.376-82 (May-June 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.3, p.417-23 (May-June 1982). [received: Feb. 1983]

From measurements of the height and rate of capillary rise of water in quartz capillaries with nascent surfaces, relationships between the contact angle θ and the rate of meniscus movement v have been obtained. The relationships $\theta(v)$ have the same qualitative form as the theoretical relationships for dynamic contact angles. However, the deviations of θ from the static values proceed at a much lower rate than would be predicted from hydrodynamic calculations. (31 refs.)

62211 On the temperature derivative of the surface tension at a critical end point. M.Robert, P.Tavan (Baker Lab., Cornell Univ., Ithaca, NY, USA).

J. Chem. Phys. (USA), vol.78, no.5, p.2557-60 (1 March 1983).

It is shown that, according to the van der Waals theory of fluid interfaces, the surface tension of the interface between a noncritical and a critical phase has a continuous temperature derivative. This result holds for any number of phases and independently varying densities and is not restricted to classical values of the critical exponents. (16 refs.)

62212 Surface tension of binary molten salt mixtures. J.D.Pandey, U.Gupta (Dept. of Chem., Univ. of Allahabad, Allahabad, India).

J. Phys. Chem. (USA), vol.86, no.26, p.5234-7 (23 Dec. 1982).

The surface tension of binary molten salt mixtures has been evaluated by utilizing the Flory theory, the Eberhart equation, and the Brock-Bird relationship as a function of composition. The agreement between the theoretical and experimental values was satisfactory. The Eberhart relation overestimates surface tension values, whereas the Flory theory, in most of the systems, underestimates it. The maximum deviations were observed in the case of the Brock-Bird relation. (32 refs.)

62213 Alternative boundary conditions for a drop hanging from a circular tube. M.A.Fortes, R.M.Miranda (Centro de Mecânica e Materiais, Univ. Técnica de Lisboa, Lisboa, Portugal).

J. Chem. Soc. Faraday Trans. 1 (GB), vol.79, no.1, p.81-92 (Jan. 1983).

The stability of pendent liquid drops with axial symmetry is usually discussed for a specific type of boundary condition, ignoring the possibility of transitions between one type and another. The alternative configurations are denoted by θ , r_i and r_o according to whether the drop contacts the base of the tube or its inner (r_i) or outer edge (r_o). Transitions between these configurations are predicted from the appropriate thermodynamic functions for both volume- and pressure-controlled drops. The main conclusion is that in volume-controlled drops the r configurations are unstable relative to the θ configuration when the actual contact angle is reached, but in pressure-controlled drops the reverse may be true. The limiting stable configurations of drops are discussed, taking into account the transitions between different boundary conditions. (15 refs.)

62214 Mechanical model for a spherical interface with low tension. D.G.Hall (Port Sunlight Lab., Unilever Res., Bebington, England), D.J.Mitchell.

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.2, p.185-93 (Feb. 1983).

The conventional treatment of a spherical interface models the mechanical properties of the system by regarding it as two bulk phases of uniform pressure separated by an infinitely thin membrane of uniform tension σ . This membrane is located at the surface of tension which is positioned so that the resultant forces and their first moments about the centre of the sphere in the model system match those in the real system. The basic results of this treatment including the relationship between mechanical and thermodynamic viewpoints are rederived in a simple yet illuminating way and without recourse to the assumption that bulk properties must be established within the interior of the sphere. (28 refs.)

62215 Calculation of the contact angle of mercury on plane solid oxides. A.T.Yeates, G.D.Halsey (Dept. of Chem., Univ. of Washington, Seattle, WA, USA).

Powder Technol. (Switzerland), vol.34, no.1, p.69-73 (Jan.-Feb. 1983).

Aside from its intrinsic interest, the contact angle for mercury on solid oxides is required for the interpretation of the intrusion pressure for mercury into porous oxide structures. The calculation presented is based on the model structureless mercury liquid brought into contact with specific surfaces of an FCC lattice composed of oxide ions. The pairwise interaction energy is calculated with the Kirkwood-Muller equation, and the lattice sums are based on

the work of Steele (see *Surface Sci.*, vol.36, p.317, 1973) as developed for physical adsorption. The results are compared with established advancing contact angles used in mercury porosimetry. (13 refs.)

62216 Chain fusion and orientational ordering in monomolecular layers of amphiphilic molecules. G.Albinet (Dept. de Phys. des Liquides, Univ. de Provence, Marseille, France), A.-M.S.Tremblay.

Phys. Rev. A (USA), vol.27, no.4, p.2206-16 (April 1983).

A model which describes the competition between chain melting and orientational ordering in a monomolecular layer of long-chain amphiphilic molecules is studied. This model is analogous to the Berker-Cardy-Nelson-Scalapino model for phase transitions in films of ^3He - ^4He mixtures. Their Midgal-Kadanoff renormalization-group approach is applied to the present problem. It reveals two phase transitions. A first-order one, associated with the melting of hydrophobic chains and a Kosterlitz-Thouless-type transition linked to the existence of topological orientational order of the chains in the high-molecular-area region. Isotherms and coexistence curves in the region of the liquid-expanded liquid-condensed transition are calculated. The disagreement with experimental results suggests that the model does not adequately describe the phase transition. This is in contradiction with a previous suggestion based on mean-field considerations. (39 refs.)

62217 Optical test of the equation of state of an interfacial region. E.V.Veitsman.

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.410-11 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.944-7 (Aug. 1982). [received: April 1983]

The thickness (ΔL) of the interfacial region at a phase boundary has been determined for the first time by an optical method. A satisfactory agreement between the thicknesses of the interfacial regions determined from the thermodynamic expression and by the optical method has been achieved for 14 liquids. (7 refs.)

62218 Interface and transport phenomena under reduced gravity. II. Surface shapes and kinetics of wetting. A.Bewersdorff (Inst. für Raumsmulation, DFVLR, Köln, Germany), G.Müller, H.Oertel, Jr., P.R.Sahm, P.-J.Sell, S.Siekman.

Z. Flugwiss. & Weltraumforsch. (Germany), vol.7, no.1, p.1-7 (Jan.-Feb. 1983). In German.

Liquids contained in propellant tanks under near zero-g conditions are subject to reduced gravity forces, surface forces and boundary adhesion. Based on the principle of the minimum of the total potential energy, the governing equations of capillary hydrostatics are derived. The equilibrium configurations of a liquid in a rotationally symmetric container can then be determined analytically or numerically. Tank geometries for technical purposes are of particular interest. Out gassing of molten matter is a basic requirement with respect to materials processing in space. The motion of bubbles in a liquid can be investigated in a terrestrial workshop in a simple and reliable manner using a Hele-Shaw cell. The test apparatus permits the study of bubble dynamics under simulated microgravity and the influence of a temperature gradient. The wetting kinetics of model tubes under the conditions of a low gravitational environment is also dealt with in some detail. (40 refs.)

62219 Electron diffraction from ZrO_2 on $\alpha\text{-Zr}(10\bar{1}0)$. R.A.Ploc (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).

J. Nucl. Mater. (Netherlands), vol.115, no.1, p.10-17 (March 1983).

A transmission electron diffraction study was made of oxide films grown anodically and thermally (573K) on $\alpha\text{-Zr}(10\bar{1}0)$. Considerable differences were noted. Several oxide/metal orientational relationships were found. These are apparently determined by stress and zirconium ion matching across the oxidizing metal interface. (11 refs.)

62220 Surface characterization of substrate by ellipsometry. T.Wada, Y.Katsuyama (R/D Dept., Sumitomo Special Metals Co. Ltd., Osaka, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.343-6 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The surfaces of several kinds of substrate materials were polished by various methods. The quality of these polished surfaces was evaluated by a stylus instrument and ellipsometry. The thickness of the surface Beilby layer and some of its effects on the magnetic properties are discussed. (5 refs.)

62221 Direct determination of the $\text{Au}(110)$ reconstructed surface by X-ray diffraction. I.K.Robinson (Bell Labs., Murray Hill, NJ, USA).

Phys. Rev. Lett. (USA), vol.50, no.15, p.1145-8 (11 April 1983).

The method of glancing-incidence X-ray diffraction has been applied to the $\text{Au}(110)$ reconstructed surface. The long-range structure is incommensurate with the bulk in one direction, comprising locally 2×1 regions separated by domain walls. The atomic positions in the 2×1 cell are determined independently of any models, and their alignment with respect to the bulk is deduced; the result is a missing-row structure with lateral pairing displacements in the second layer of $0.122\pm 0.017 \text{ \AA}$. (15 refs.)

62222 The surface structure of $\alpha\text{-Sn}(100)$. D.P.Woodruff, K.Horn (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).

Philos. Mag. A (GB), vol.47, no.3, p.15-8 (March 1983).

Low-energy electron diffraction studies of the semiconducting $\alpha\text{-Sn}(100)$ surface have shown that this surface is reconstructed with a (2×1) mesh and that while the adsorption of atomic hydrogen on this surface leads to some structural rearrangement, the (2×1) mesh is retained. These results are compared with the properties of $\text{Si}(100)$ and $\text{Ge}(100)$ surfaces. In particular, it is

proposed that hydrogen adsorption on α -Sn leads to the formation of a mono-hydride phase. (14 refs.)

68.25 MECHANICAL AND ACOUSTICAL PROPERTIES OF SOLID SURFACES AND INTERFACES

[for tribology, see 62.20P and 81.40P]

62223 Energy transport velocity of surface elastic waves. S.R.Seshadri (Dept. of Electrical & Computer Engng., Univ. of Wisconsin, Madison, WI, USA).

J. Appl. Phys. (USA), vol.54, no.4, p.1699-703 (April 1983).

For the Love wave and the Rayleigh wave the power flux and the energies are evaluated, and, therefore, the group velocity is determined by the dynamic method and is verified to be identical to that obtained by the kinematic method. A proof based on a variation theorem is also provided to show in a general way that the kinematic and the dynamic methods yield identical results for the group velocity of the surface elastic waves. (12 refs.)

62224 Surface photoacoustic spectroscopy—a new technique for the study of surface vibrations. F.Trager, T.J.Chuang, H.Coufal (IBM Res. Lab., San Jose, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.19-24 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Photoacoustic studies of SF_6 adsorbed on Ag surfaces have been performed with a CO_2 laser. Simultaneous XPS measurements clearly demonstrate monolayer surface sensitivity of photoacoustic spectroscopy under UHV conditions. The photoacoustic spectrum at 0.2 monolayer surface coverage shows a characteristic SF_6 vibrational band. Furthermore, XPS spectra exhibit fine structures indicating distinctive SF_6 -Ag interactions. (15 refs.)

62225 Roughness-trapped shear horizontal surface acoustic waves. O.H.Dupare (Lab. d'Etude de Surfaces et Interfaces, ISEN, Lille, France).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.145-50 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Shear horizontal surface acoustic waves do not exist on the flat surface of a semi-infinite elastic medium. It has been shown by several authors recently that such waves can exist on a periodically corrugated, planar surface. The authors show on the basis of the Rayleigh method that shear horizontal surface acoustic waves exist on a randomly rough planar surface of an isotropic elastic medium. These waves are only weakly localized to the surface and they have a lifetime that is long due to their roughness-induced scattering into other surface acoustic waves and into bulk waves. (6 refs.)

62226 Leaky surface-elastic-waves on flat and highly corrugated surfaces for isotropic non-dissipative media. N.E.Glass, A.A.Maradudin (Dept. of Phys., Univ. of California, Irvine, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.151-6 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The dispersion relation for Rayleigh waves on a grating-surface of a semi-infinite, isotropic, nondissipative, elastic medium is solved numerically, with complex wave vector k or complex frequency, in the radiative region (above the bulk transverse sound-line) and within the first frequency-gap on the Brillouin zone boundary created by the grating periodicity. The acoustic attenuation, found from the imaginary part of k , agrees well with experiment. A dispersive branch, with corresponding complex-solutions for the flat surface, between the bulk transverse and longitudinal sound-lines, representing a new leaky mode or surface resonance, accounts for the principal peak in the attenuation. (6 refs.)

62227 Acoustically induced plastic deformation of conical microcrystals on copper surfaces. I.H.Wilson, J.Belson (Dept. of Electronic & Electrical Engng., Univ. of Surrey, Guildford, England).

Philos. Mag. A (GB), vol.47, no.3, p.351-61 (March 1983).

Micron-size conical microcrystals have been cultured on a copper surface using the sputtering action of a 100 keV argon-ion beam. When subsequently exposed to an intense 25 kHz acoustic field the cones were found to bend. The bent forms were identical in appearance to the distorted forms reported from time to time for unvibrated cones. These observations lend support to

the authors' recent theory that spontaneous bending is due to slip driven by surface stress which is accommodated by a tendency towards adoption of a helicoidal minimal surface shape. (7 refs.)

62228 Electrodynamic study of the ellipticity of surface acoustic waves near the phase transition in Rochelle salt. V.S.Borshchan, M.V.Manuilov, A.A.Podgornov, O.Yu.Serdobolskaya, I.Yu.Solodov (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1460-2 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2574-7 (Sept. 1982). [received: April 1983]

An experimental study was made of the change in structure of surface acoustic wave displacements near the phase transition in Rochelle salt. It was found that the ratio of the vertical and horizontal components of the wave displacement ellipse on the surface of the sample increases considerably as the transition is approached. The direction of motion of the particles in the wave is unchanged, being contrary in both the paraelectric and the ferroelectric phase. (6 refs.)

68.30 DYNAMICS OF SOLID SURFACES AND INTERFACE VIBRATIONS

62229 Lateral interactions and vibrational lifetimes. B.N.J.Persson (Inst. für Festkörperforschung, KFA Jülich, Jülich, Germany).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.43-57 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The author considers three related topics, namely (A) Lateral interactions between adsorbed molecules; (B) Optical properties of two-dimensional systems of small metallic particles (C) Damping of excitations at surfaces. None of these topics are treated in great detail but the author shows that topics (A)-(C) are closely related and that they constitute a unified body of knowledge, which should be useful in gaining insight into such diverse fields as the optical properties of solar energy absorbers, heterogeneous catalysis and photosynthesis. (24 refs.)

62230 Dipole-dipole coupling in adsorbate vibrational mode spectra. Z.Schlesinger (Bell Labs., Murray Hill, NJ, USA), A.J.Sievers.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.67 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given as follows: Separating chemical effects from those due to long range dipole interactions is a recurring problem in the analysis of adsorbate vibrational mode spectra. For adsorbate systems containing only one site and one type of adsorbate (homogeneous systems), agreement between theory and experiment has been obtained. For systems containing inequivalent occupied sites or more than one adsorbate species (inhomogeneous systems), the analysis of effects due to dipole coupling can become complicated. The authors show that a simple effective medium model, similar to those used for thin film coatings, can be used to analyze such systems. The validity of this model is tested by comparing its results to those obtained by numerically solving the exact equations of motion for arrays of coupled point dipole oscillators. Dramatic line narrowing due to dipole coupling, as well as the more well known frequency and intensity shifts are exhibited in both models. Using a sample prescription to determine the effective thickness and density for the effective medium model, the authors obtain results which are both qualitatively and quantitatively equivalent to those of the much less tractable point dipole model. The authors conclude that, despite its extreme simplicity, an effective medium model can be used to accurately treat the effects of dipole coupling in inhomogeneous as well as homogeneous adsorbate systems. (5 refs.)

62231 Electronic damping of the motion of adsorbates on metal surfaces. M.Persson, B.Hellsing, B.J.Lundqvist (Inst. of Theoretical Phys., Chalmers Univ. of Technol., Göteborg, Sweden).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.119-24 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

First principle calculations of the electronic mechanism for the energy exchange between H and H_2 and a jellium substrate are reported. The vibrational damping rate of H_2 is found to be enhanced, when the molecule induces a resonant electronic state near the Fermi level of the substrate. The results for the vibrational broadening of H compares favourably with experimental observations, and the energy of a slowly incoming atom is, according to a friction description, found to be effectively accommodated by this electronic mechanism. (18 refs.)

62232 Theoretical vibrational frequencies for NH_x and CH_x reactive intermediates on nickel(100) and nickel(111) surfaces. J.J.Low, V.I. W.A.Goddard, III (Arthur Amos Noyes Lab. of Chem. Phys., California Inst. of Technol., Pasadena, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.27 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given, as follows. Theoretical studies have been performed on CH_x and NH_x species chemisorbed on threefold and fourfold sites of nickel clusters. From this work the authors have obtained geometries and vibrational frequencies that can be compared with experimental data concerning these species chemisorbed on Ni(100) and Ni(111) surfaces. These results can be used to help assign the observed losses in EELS spectra for CH on the Ni(111) surface. (no refs.)

62233 Surface phonons in superlattices. B.Djafari-Rouhani, L.Dobrzynski, O.H.Dupare (Lab. d'Etude des Surfaces et Interfaces, Lille, France).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.119-24 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Reports the existence of surface localized phonons for a superlattice consisting of alternating slabs (parallel to the surface) of two different crystals. The

superlattice has a larger periodicity in the direction perpendicular to the slabs and therefore many phonon branches in the folded Brillouin zone. In the gaps existing between these phonon branches appear the surface localized models. (7 refs.)

62234 Bound states of two surface phonons at a crystal surface with an adsorbed monolayer. A.G.Eguiluz, A.A.Maradudin (Dept. of Phys., Univ. of California, Irvine, CA, USA). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.30, p.125-30 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). The authors obtain the Bethe-Salpeter Equation for the Green's function describing the propagation of two surface phonons interacting via cubic and quartic anharmonicity. They solve that equation by keeping only the latter contribution to its kernel. The two-dimensional nature of the problem is reflected in the existence of a bound state of two high-frequency surface phonons associated with the presence of an overlayer of light atoms, for all values of the coupling strength. This is illustrated with the detailed solution of a simple model. (12 refs.)

62235 A search for high frequency vibrational modes at a stepped surface. G.J.Pinas, A.A.Maradudin (Dept. of Phys., Univ. of California, Irvine, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.131-6 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). Presents a theory of the vibrations of atoms in the vicinity of a stepped surface on a Bravais crystal. The static relaxations in the positions of the atoms in the crystal are determined, and the atomic force constants are then calculated in the relaxed atomic configuration. The general theory is applied to a simple stepped surface, and the local phonon density of states is carried out for atoms at several points on the stepped surface by the real space continued fraction recursion method. No evidence is found for high frequency surface phonons. (5 refs.)

62236 Experimental study of relative intensities in inelastic electron tunneling spectroscopy (IETS). S.Gauthier, J.Klein, A.Leger, S.de Cheveigne, C.Guinet (Groupe de Phys. des Solides, Ecole Normale Supérieure, Paris, France).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.209-14 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). Presents an experimental study of the relative intensities in inelastic tunneling spectra of formic and acetic acid chemisorbed on alumina. The theoretical framework is given by the simplest theory of tunneling intensities, the theory of Scalapino and Marcus (1967). The comparison between the experimental results and the predictions of this theory provides evidence for an important discrepancy in the relative intensities in the spectrum of a given molecule. This disagreement is only partially resolved by considering the influence of the counter-electrode of the junction on the tunneling intensities. So, on the basis of an alternative derivation of the results of the theory of Scalapino and Marcus, the authors discuss to what extent it can be applied to the interpretation of tunneling spectra. (12 refs.)

62237 Conference overview, directions and future work and critical issues: theory [surface vibrations]. T.B.Grimley (Donnan Labs., Univ. of Liverpool, Liverpool, England).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.229-35 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). Describes the goals of theoretical work on vibrations at surfaces, and comments on some of the contributions to VAS-82. Its main purpose however is to specify areas where theoretical work is urgently needed, and to identify some critical issues. Among the latter, the most important is the use of clusters to model atomic and molecular processes on solid surfaces. (2 refs.)

62238 Conference overview: experimental [surface vibrations]. H.Ibach (Inst. für Grenzflächenforschung und Vakuumphys., KFA Jülich, Jülich, Germany).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.237-46 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). Current status and future development of experimental techniques for surface vibration spectroscopy are reviewed. It is proposed that in addition to the vibration frequencies the intensities in the spectra should be measured more carefully and then used as a source information. The need for a fast and still sensitive spectroscopy is emphasized. (17 refs.)

62239 Reemitted-positron energy-loss spectroscopy: a novel probe of adsorbate vibrational levels. D.A.Fischer, K.G.Lynn, W.E.Frieze (Brookhaven Nat. Lab., Upton, NY, USA).

Phys. Rev. Lett. (USA), vol.50, no.15, p.1149-52 (11 April 1983). Vibrational excitations of carbon monoxide on Ni(100) have been observed for the first time in the energy-loss spectrum of reemitted positrons. For Ni(100)(c)(2x2)CO at room temperature, energy-loss peaks are found at ~57 and ~248 meV, corresponding to Ni-C and C-O stretching vibrations, respectively. These peak positions are in good agreement with previously reported results for electron energy-loss spectroscopy. Anticipated improvements in resolution promise to make reemitted-positron energy-loss spectroscopy competitive with high-resolution electron energy-loss spectroscopy. (14 refs.)

62240 Effect of surface parameter of interband surface mode frequencies of finite diatomic chain. H.Puszkarski (Phys. Inst. A. Mickiewicz Univ., Poznań, Poland).

Physica B & C (Netherlands), vol.115 B+C, no.3, p.367-75 (March 1983). The surface modes of a finite diatomic chain of alternating atoms ($M_1 \neq M_2$) are investigated. The surface force constants are assumed to differ from the bulk ones, with the resulting surface parameter a identical on both ends of the chain. The criteria governing the existence of interband surface (IBS) modes with frequencies lying in the forbidden gap between acoustical and optical bulk band for natural ($a=1$) as well as non-natural ($a \neq 1$) surfaced defects are analyzed by the difference equation method. It is found that the IBS modes localize, depending on the value of the surface parameter a , either at the surface of lighter atoms (if a is positive), or at that of heavier atoms (if a is negative). Two, one or no IBS mode is found to exist in the chain depending on the relation between the mass ratio and surface parameter—the quantities on which the surface localization increment t depends. If two modes (one acoustical and the other optical) are present, their frequencies are displaced symmetrically with respect to the middle of the forbidden gap if the surface defect is natural, and asymmetrically if it is other than natural. If the localization of the IBS mode exceeds a well-defined critical value t_c , the mode frequency becomes complex, indicating that the mode undergoes a damping. A comparison of the present results and those obtained by Wallis (1957) for the diatomic chain with a natural surface defect is also given. (8 refs.)

62241 Harmonic surface entropy of noble gas crystals: cell cluster method. R.H.Kincaid, D.A.Huckaby (Dept. of Chem., Texas Christian Univ., Fort Worth, TX, USA).

J. Chem. Phys. (USA), vol.78, no.5, p.2598-9 (1 March 1983). The harmonic surface entropy was calculated for FCC and HCP crystals with first-neighbor interactions. The crystals chosen had shapes of minimum lattice energy under first-neighbor interactions. Although the bulk harmonic entropy is higher for FCC than the HCP crystals, the surface harmonic entropy was found to be higher for HCP than for FCC crystals. In fact, the overall harmonic entropy was found to be higher for HCP than for FCC crystals having fewer than a few thousand atoms. (10 refs.)

62242 Tight-binding cluster Bethe lattice model studies of chemisorption. B.C.Khanra (Solid State & Molecular Phys. Div., Saha Inst. of Nuclear Phys., Calcutta, India).

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.76-9 (25 March 1983). The surface Green's function which is used in model calculations for chemisorption systems has been approximated by the tight-binding cluster Bethe lattice model (TBCBLM). It is shown that for chemisorption of a single-orbital atom on a simple cubic lattice this model yields results in good agreement with Einstein and Schrieffer's results (1973). The effects of cluster size on the chemisorption properties are explored. (6 refs.)

62243 The influence of preadsorbed hydrogen and CO and adsorption of ethylene on the Pd(111) surface. I.Ratajczykowa, I.Szymerska (Inst. of Phys. Chem., Polish Acad. of Sci., Warsaw, Poland).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.243-6 (1 April 1983). The coadsorption of C_2H_4 with H_2 and CO on Pd(111) has been investigated at 300 and 330K. At 300K two forms of adsorbed ethylene coexist on the surface in the presence of ethylene gas: a molecular form desorbing as C_2H_4 at 330K and a dissociatively adsorbed form (giving only hydrogen in desorption spectra) which is stable both in vacuum and in hydrogen at 10^{-8} Torr. The molecular form seems to be a precursor state for hydrogenation and for dissociative adsorption. Both processes are controlled by the amount of coadsorbed hydrogen which in turn is controlled by CO coverage. (11 refs.)

- 62244** An EELS and TDS study of molecular oxygen desorption and decomposition on Pt(111). N.R.Avery (Univ. of Melbourne, Parkville, Victoria, Australia). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.3, p.371-3 (8 April 1983). Correlation of EEL and TD spectra for the adsorption of O_2 on Pt(111) at $<100K$ has identified the respective roles of the two molecularly adsorbed states in the apparently competing processes of desorption and dissociation. (8 refs.)
- 62245** LEED/AES studies of the Ge on Si(111)7 \times 7 surface. K.Shoji, M.Hyodo, H.Ueba, C.Tatsuyama (Dept. of Electronics, Faculty of Engng., Toyama Univ., Toyama, Japan). *Jpn. J. Appl. Phys. Part 2 (Japan)*, vol.22, no.3, p.L200-2 (March 1983). Germanium was evaporated on the clean Si(111)7 \times 7 surface at room temperature. With increase in Ge coverage θ , the intensity of the Si(LVV) AES signal decreased in accordance with a 2-dimensional growth mode up to a few monolayers, and the LEED pattern gradually changed from the (7 \times 7) structure to a diffused (1 \times 1) one at $\theta < 2$ monolayers and to a nonstructural one at $\theta > 2$. The LEED pattern and the AES intensity drastically changed by annealing. The Si(111)7 \times 7 surface covered by 2 monolayers of Ge shows a (5 \times 5) structure by annealing at temperature between 380 and 720°C.
- 62246** Theoretical studies of molecular adsorption on metal surfaces. B.I.Lundqvist, B.Hellsing, S.Holmstrom, P.Nordstrom, M.Persson (Inst. of Theoretical Phys., Chalmers Univ. of Technol., Goteborg, Sweden), J.K.Nor-skov. *Int. J. Quantum Chem. (USA)*, vol.23, no.3, p.1083-90 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982). A theoretical program in surface physics aiming at a description of different aspects of adsorption of atoms and molecules on metal surfaces is shortly reviewed. (18 refs.)
- 62247** The mode of the attack of oxygen atoms on the basal plane of graphite. Chor Wong, R.T.Yang (Dept. of Chem. Engng., State Univ. of New York, Amherst, NY, USA), B.L.Halpern. *J. Chem. Phys. (USA)*, vol.78, no.6, pt.1, p.3325-8 (15 March 1983). Gold decoration of the basal lattice plane of graphite etched by atomic oxygen has been made possible by first desorbing the surface oxide layer on the basal plane. The formation of monolayer pits, as revealed by gold decoration, shows that anisotropy does exist, i.e. carbon atoms are preferentially attacked by atomic oxygen in the direction of a axes, rather than the direction of c axis. The monolayer pits are initiated from lattice vacancies which are continually formed by atomic oxygen. The monolayer pits created by atomic oxygen are, unlike the pits by O_2 which are circular, hexagonal in shape, the sides of which are composed of {1011} lattice planes. (14 refs.)
- 62248** Energy and momentum accommodation coefficients on platinum and silver. F.D.Shields (Univ. of Mississippi, Univ., MS, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.1, p.3329-33 (15 March 1983). Acoustical measurements of energy (EAC) and tangential momentum accommodation coefficients (TMAC) indicate that stable and reproducible Pt and Ag surfaces are obtained by heating in a vacuum. EAC and TMAC values are given for He and Ne on the heat-cleaned Pt and Ag surfaces and for these gases on Pt and Ag surfaces after exposure to various adsorbent gases. AC values are also given for the various adsorbent gases on themselves on the heat-cleaned Pt and Ag surfaces. (11 refs.)
- 62249** Variation with temperature of the thickness of an adsorbed polymer layer in the collapsed state. P.Dejardin (CNRS, Centre de Recherches sur les Macromolécules, Strasbourg, France). *J. Phys. (France)*, vol.44, no.4, p.537-42 (April 1983). The behaviour of the hydrodynamic thickness L_H , below the θ -temperature for the system polystyrene/trans-decalin, is consistent with the presence of a collapsed adsorbed polymer layer. For three samples of polystyrene ($M_w \approx 10^5$, $M_w = 6 \times 10^5$, $M_w = 4 \times 10^5$), one observes a power law dependence $L_H \sim (\theta - T)^\alpha$ with values of α (-0.87; -0.83; -0.80) close to 1.0 rather than to 1/3. These results are consistent with an interdependent macromolecule model. Attempts to obtain a logarithmic factor $[\ln(T/\theta - T)]^\beta$ give values of β between -0.39 and -0.65, to be compared with the value -0.636 obtained theoretically by De Gennes (1979) for a chain surrounded by solvent near the θ -temperature. (35 refs.)
- 62250** The thermodynamics of the system CaNi $_2$ H $_2$ using differential heat conduction calorimetry. J.J.Murray, M.L.Post, J.B.Taylor (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Ontario, Canada). *J. Less-Common Met. (Switzerland)*, vol.90, no.1, p.65-73 (March 1983). The pressure-composition isotherms and enthalpies of 313.6K are reported for hydrogen absorption and desorption in CaNi $_2$ H $_2$ with $0 < x < 2$. Enthalpy measurements were made using a Calvet-Prat differential heat conduction calorimeter. Partial relative enthalpies for the α solution and the β single-phase regions are reported together with the enthalpies of transition for the $\alpha \rightarrow \beta$ and $\beta \rightarrow \gamma$ reactions. The latter enthalpies (negative or exothermic for absorption and positive for desorption) are 43.4 ± 0.7 and 33.1 ± 0.5 kJ (mol H $_2$) $^{-1}$, the quoted errors being the total probable errors. (16 refs.)
- 62251** Phase and bonding transitions in chemisorbed layers studied by vibrational frequency shifts. D.A.King (Donnan Labs., Univ. of Liverpool, Liverpool, England). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.11-24 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). Coverage-dependent frequency shifts have been observed for a wide variety of adsorbates on metal single crystal surfaces. In some cases, these shifts are attributable to changes in bonding coordination to surface metal atoms, or to alterations in the geometry of the chemisorbed complex. The major part of this review is concerned with the information that can be obtained from shifts which have been observed, both upward and downward in frequency, when bonding coordination or geometric effects do not occur. It is shown that when the observation of frequency shifts is combined with the measurement of singlet frequencies using the dilution limit isotopic mixing method of Crossley and King (1980) (now applied to CO adsorption on a variety of metal single crystals), shifts due to dipole coupling in the overlayer can be deconvoluted from shifts due to chemical (bonding) effects. A review of recent data for CO adsorption on Pt(111), {100} and {110}, Cu(111), {100} and {110}, Pd(100) and Ru(100) is presented which illustrates the information available from such data concerning phase boundaries between lattice gas, island and condensed phases, and also subtle changes in adsorbate bonding. (34 refs.)
- 62252** High resolution infrared study of hydrogen chemisorbed on Si (100). Y.J.Chabal, E.E.Chaban, S.B.Christman (Bell Labs., Murray Hill, NJ, USA). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.35-40 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). The vibrational spectrum associated with hydrogen chemisorbed on Si (100) was studied for the first time by means of Fourier transform infrared spectroscopy. The low coverage phase (monohydride) is characterized at room temperature by a broad line ($\Delta \approx 17$ cm $^{-1}$) at 2095 cm $^{-1}$ which sharpens upon mild annealing, indicating an ordering of the hydrogen monolayer. The high coverage phase (dihydride) features symmetric [$\nu_1 = 2099$ cm $^{-1}$, $\Delta = 5$ cm $^{-1}$] and antisymmetric [$\nu_2 = 2087$ cm $^{-1}$, $\Delta = 5$ cm $^{-1}$] stretching modes with dynamic dipole moments perpendicular and parallel to the surface, respectively. The effective charge, $e^+|e| \approx 0.01$, is consistent with early theoretical predictions. The resulting dipolar interaction is too weak to account for the 12 cm $^{-1}$ splitting, suggesting a small chemical interaction. (26 refs.)
- 62253** Vibrations spectra of oxygen chemisorbed on nickel (110) surfaces. G.Allan (Lab. de Phys. des Solides, Inst. Supérieur d'Electronique du Nord, Lille, France), J.Lopez. *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.61-6 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). Using a simple tight-binding scheme to describe the nickel d states and the oxygen p states, the authors calculate the positions and the vibration frequencies of chemisorbed oxygen atoms on nickel (110) surfaces. The comparison between the authors' results and the high resolution electron loss measurements suggests a long bridge chemisorption site at low and high oxygen coverages on the nickel surface. (20 refs.)
- 62254** Ab initio CI investigation of hydrogen atom adsorption on Li clusters: embedded cluster model. H.O.Beckmann (Dept. of Chem., State Univ. of New York, Stony Brook, NY, USA). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.77-81 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). The chemisorption of H on clusters representing the (100) surface of Li BCC lattice has been studied with ab initio SCF and CI methods and an embedding theory based on orbital localization (Whitten and Pakkanen, Phys. Rev. B21 (1980), p.4357). The results suggest that a convergence of the properties for adsorption on cluster models is almost reached when all metal atoms involved in the adsorption are surrounded by their neighbors. (4 refs.)
- 62255** Investigation of lateral interactions in chemisorption. I.P.Batra (IBM Res. Lab., San Jose, CA, USA). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.83-90 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). It is believed that lateral interactions play an important role in chemisorption site selection. With the advent of angular resolved and polarization dependent photoemission spectroscopies, one is able to compare computed band structure with angular resolved photoemission data. This advance coupled with theoretical calculations provides an excellent opportunity for investigating direct (adsorbate-adsorbate) and indirect (through-substrate) lateral interactions at surfaces. The author modelled the chemisorption of oxygen on Al (111) using direct lateral interactions only (isolated monolayer). The calculated results provide a good framework for interpreting the data. For O_2 monolayer the direct lateral interactions are also appreciable and lead to significant dispersion in the calculated energy bands. The author has also computed the electronic structure for two dimensional isolated layers of CO in ordered configurations observed on a Pd (100) surface. The shape and width of the 4 σ -derived band is satisfactorily accounted for by this direct lateral interaction only model. Having demonstrated that direct lateral interactions lead to observable band dispersions, it is suggested that they might influence normal vibrational frequencies and ought to be included. (25 refs.)
- 62256** Selective desorption from the binary coadsorbate C_2H_4 -CH $_3$ F-NaCl by resonant vibrational excitation with laser infrared radiation. J.Heidberg, I.Hussla (Inst. fur Phys. Chem. und Elektrochem., Univ. Hannover, Hannover, Germany). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.105-10 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). After measuring the linear infrared absorption spectrum of the coadsorbate, selective desorption of CH $_3$ F from the binary coadsorbate C_2H_4 -CH $_3$ F-NaCl under ultrahigh vacuum conditions at 120K stimulated by resonant CO $_2$ laser pulses of small fluence ~ 0.1 J.cm $^{-2}$ has been carried out. No desorption of ethane, which is slightly more volatile, but has no significant infrared absorption at the laser frequency, was observed. The primary activation step is the resonant multiphoton excitation of the most intense internal CH $_3$ F-NaCl adsorbate vibration, the C-F stretching mode ν_3 . The substance separation seems to indicate high localisation of the activation in this desorption and could be of interest for applications. (12 refs.)
- 62257** Laser-induced thermal desorption of CO from clean polycrystalline copper: time-of-flight and surface diffusion measurements. R.Viswanathan, D.R.Burgess, Jr., P.C.Stair, E.Weitz (Dept. of Chem., Northwestern Univ., Evanston, IL, USA). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.111 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). Summary form only given as follows. Pulsed laser-induced thermal desorption was utilized as a technique to study the dynamics of desorption and surface diffusion of CO on clean polycrystalline copper at 85K in UHV. Single pulses of a focused KrF excimer laser (248 nm, 15 ns FWHM) were used to desorb the CO molecules, which were subsequently detected by a quadrupole mass spectrometer (effective time constant ≈ 4.4 μ s). The time-of-flight (TOF) plus distribution was recorded using a fast transient recorder (Biomat 610B/8100). The surface diffusion measurements were made using a versatile technique. The TOF desorption spectra could be fit to Boltzmann distributions, and effective translational temperatures of the desorbed CO molecules were obtained from these fits. The desorption process was studied as a function of laser power density, and a desorption threshold corresponding to an absorbed power density of 10 MW cm $^{-2}$ was observed. Near threshold, both the desorption flux and velocity distribution varied rapidly with laser power density. At power densities much larger than the threshold (30-75 MW cm $^{-2}$), the peak desorption flux varied approximately linearly with power density. In the range of power densities studied, the most probable velocity of the CO molecules varied between 350 and 500 m s $^{-1}$, corresponding to Boltzmann temperatures between 200 and 400K. The applicability of the classical desorption rate equation for laser induced desorption on polycrystalline copper at 110K yielded a value for the diffusion coefficient $D = 5 \times 10^{-7}$ cm 2 s $^{-1}$ ($\pm 2 \times 10^{-7}$ cm 2 s $^{-1}$) (ref.1). The temperature dependence of the

diffusion coefficient is currently being investigated in detail in order to accurately determine the activation energy for the diffusion process. (1 ref.)

62258 Surface vibration correlation with d-electron (hole) per atom ratio (d-bandfilling) in CO chemisorption on supported transition metal particles: dominance of Hund's rule and d-electron degeneracy in real supported catalysts. E.Siegel.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.155 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given as follows. The findings of Guerra and Schulman (1969) of a correlation between force constant of metal-CO chemisorbed species (ad molecules) with the number of d-holes per atom (1-number of d-electrons per atom, or d-bandfilling) of the transition metal particle (supported) surface is treated using the tenfold degenerate Hubbard (TDHM) and Anderson (TDAM) models developed for magnetic and Mott metal-insulator transition problems in transition metals, alloys and compounds. Their experimental finding that via infrared spectroscopy on the CO adsorbed species (ad molecule) bond, the infrared surface vibrational frequency, CO bond order and CO bond force constant were nearly linear versus the number of d-holes per transition metal surface atom is easily explained via the TDHM and TDAM via their inherent d-bandfilling dependent (alloy specific) Coulomb and exchange enhanced coupling strength between d-electrons or d-holes. Even the Fulde correction to the number of d-electrons (holes) per surface atom as a function of transition metal particle size does not change the excellent agreement, but merely renormalizes the measured functional properties versus d-hole per atom ratio for a suite of equally fine sized transition metal particles. So it seems that in ad molecule chemisorption (at least for CO) the degenerate electronic properties to the surface dominate the vibrational and bonding properties of the ad molecular species rather completely. (5 refs.)

62259 The chemisorption of nitrogen on the (001) surface of ruthenium. A.B.Anton, N.R.Avery, B.H.Toby, W.H.Weinberg (Div. of Chem. & Chem. Engng., California Inst. of Technol., Pasadena, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.181-6 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

High resolution electron energy loss spectroscopy (EELS), thermal desorption mass spectrometry (TDMS) and low energy electron diffraction (LEED) have been used to investigate the molecular chemisorption of N_2 on Ru(001) at 75K and 95K. Adsorption at 95K produces a single chemisorbed state, and, at saturation, a $(\sqrt{3} \times \sqrt{3})R30^\circ$ LEED pattern is observed. Adsorption at 75K produces an additional chemisorbed state of lower binding energy, and the probability of adsorption increases by a factor of two from its zero coverage value when the second chemisorbed state begins to populate. EEL spectra recorded for all coverages at 75K show only two dipolar modes $\nu(Ru-N_2)$ at $280-300\text{ cm}^{-1}$ and $\nu(N-N)$ at $2200-2250\text{ cm}^{-1}$ —indicating adsorption at on-top sites with the axis of the molecular standing perpendicular to the surface. The intensities of these loss features increase and $\nu(N-N)$ decreases with increasing surface coverage of both chemisorbed states. (15 refs.)

62260 Adsorbate structure modeling based on electron energy loss spectroscopy and lattice dynamical calculations: application to O/Al(111). R.L.Strong, B.Firey, F.W.deWette, J.L.Erskine.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.187-90 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

High-resolution electron energy loss spectroscopy (EELS) and lattice dynamical calculations based on pair interactions are used to investigate oxygen chemisorption on Al(111). The O/Al(111) system is complicated by the simultaneous formation of an oxygen overlayer and underlayer. Oxygen atoms at overlayer and underlayer sites near the Al(111) surface produce well-defined vibrational loss peaks in EELS spectra; however, dynamical coupling between the oxygen and with the host lattice cause vibrational energies to shift with overlayer and underlayer concentrations. These shifts as well as structural parameters of the O/Al(111) complex can be deduced from a slab model of the surface lattice dynamics. (5 refs.)

62261 Low frequency surface resonance modes in electron energy loss spectroscopy. T.S.Rahman (Dept. of Phys., Univ. of California, Irvine, CA, USA), D.L.Mills, J.E.Black.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.199-212 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Electron energy loss spectroscopy has proved a powerful probe of vibrational modes of a wide variety of adsorbed species. The primary focus has been on modes with frequency well above the maximum phonon frequency of the substrate. Examples are internal vibration modes of adsorbed molecules, possibly shifted significantly in frequency from their gas phase analogues, and high frequency vibrations of an adsorbed molecule or atom against the substrate. Recent experiments explore features in the energy loss spectrum with frequency below the maximum phonon frequency of the substrate, for ordered overlayers of atoms adsorbed on low index metal surfaces. The authors summarize their theoretical studies of such spectra for several adsorbate/substrate combinations, with emphasis on the physical origin of the features which appear in the calculations. They obtain a good account of the existing data, within the framework of a rather simple lattice dynamical model, and the calculations show that the features which appear are quite sensitive to the symmetry of the adsorption sites, and other details of the surface geometry. The authors illustrate this with several specific examples. (17 refs.)

62262 Theoretical calculation of vibrations of adsorbed species. P.S.Bagus, I.P.Batra, C.W.Bauschlicher,Jr., R.Broer (IBM Res. Lab., San Jose, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.225-32 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The chemisorption of oxygen on lithium, aluminum, nickel and copper surfaces has been investigated using the ab initio Hartree-Fock cluster model. These substrates have the possibility for different bonding in that Li is a simple s metal, Al an s, p and Ni(Cu) an s, p, d metal. In all cases the authors have calculated binding energy curves as a function of the oxygen-metal distance. Using these curves, they have derived oxygen-metal normal vibrational frequencies, and the equilibrium bond distance. They have compared the calculated vibrational energy with electron energy loss spectroscopic (EELS) data for Al and find a satisfactory agreement. They discuss O adsorbed on Ni(100) for which coverage dependent loss peaks have been reported but no generally acceptable interpretation exists to date. (19 refs.)

62263 Hydrogen chemisorption on Ni(110) by high-resolution electron energy loss spectroscopy. M.Nishijima, S.Masuda, M.Jo, M.Onchi (Dept. of Chem., Kyoto Univ., Kyoto, Japan).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.273-8 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

High-resolution electron energy loss spectra of hydrogen-covered Ni(110) surfaces both at 100 and 300K are presented. The adsorbed sites of hydrogen atoms are discussed. (10 refs.)

62264 Vibrational spectroscopy using HREELS of benzene adsorbed on the Rh (111) crystal surface. B.E.Koel, G.A.Somorjai (Dept. of Chem., Univ. of California, Berkeley, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.287-92 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

High resolution electron energy loss spectroscopy (HREELS) and low energy electron diffraction (LEED) have been used to study the structure of adsorbed benzene (C_6H_6 and C_6D_6) monolayers on the Rh(111) surface at 300K. A surface bonding geometry is proposed for benzene adsorbed to give a $c(2\sqrt{3} \times 4)$ rectangular structure, which involves very little perturbation of the molecular structure with the ring plane parallel to the surface. Only one chemical environment for adsorbed benzene is indicated by a single frequency shift of the symmetric C-H out-of-plane bending mode. The adsorption site is tentatively assigned to benzene centered over a single Rh atom. (8 refs.)

62265 HREELS study of formic acid adsorption on gold (110) and (111) surfaces. M.Chtaib, P.A.Thiry, J.P.Delrieu, J.J.Pireaux, R.Caudano (Lab. de Spectroscopie Electronique, IRIS, Namur, Belgium).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.293-9 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The adsorption at 100K and the temperature decomposition of formic acid were investigated on (110) and (111) gold single crystal surfaces by high resolution electron energy loss spectroscopy. A multilayer build-up of physisorbed HCOOH with intense hydrogen bondings was observed at increasing coverages for the two gold surface orientations. Above room temperature, formic acid decomposed and desorbed from the (110) crystal, whereas it evolved into an intermediate formic anhydride on the (111) face. Further heating produced on the surfaces species similar to those observed on oxygen treated metals. (18 refs.)

62266 Using surface enhanced Raman scattering to study vibrations of adsorbates on thin metallic overlayers on silver. C.A.Murray (Bell Labs., Murray Hill, NJ, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.371-82 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The author has studied the surface enhanced Raman scattering from molecules adsorbed on thin gold overlayers on silver island films. The Raman scattering of gold cyanide species adsorbed on gold overlayers decreases in intensity with gold overlayer thickness between 0.5-10 Å. This intensity decrease is consistent with a simple model which takes into account the damping of the electromagnetic resonances of the silver islands by the absorbing gold overlayer. Implications of these findings for the enhancement of Raman scattering from adsorbates on other metals deposited as overlayers on silver will be discussed. (22 refs.)

62267 Acetylene adsorption on silver films: a Raman vibrational study. I.Pockrand, C.Pettenkofer, A.Otto (Phys. Inst. III, Univ. Dusseldorf, Dusseldorf, Germany).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.409-12 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

'Coldly' evaporated silver films exposed to acetylene at 120K exhibit characteristic, enhanced Raman spectra. Peaks are identified by isotope line shifts. The results point to weak interaction of acetylene with silver. (17 refs.)

62268 Rovibrational excitation within the infinite conical well: desorption of diatomic molecules. J.W.Gadzuk (NBS, Washington, DC, USA), U.Landman, E.J.Kuster, C.L.Cleveland, R.N.Barnett.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.103-10 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

An analytic model for the hindered rotational states of a diatomic molecule adsorbed upright on a solid surface is discussed. Various model dynamics situations, within the sudden approximation, designed to simulate desorption are presented and rotational state distributions are calculated including both rotational and translational degrees of freedom. Criteria are established for observing rotationally cool desorbed molecules. (11 refs.)

62269 X-ray and neutron diffraction measurements on physisorbed films on graphite. M.Nielsen, K.Kjaer, J.Bohr (Riso Nat. Lab., Roskilde, Denmark), J.P.McTague.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.111-18 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Physisorbed films of rare gas atoms and of simple molecules on graphite surfaces are studied with the main purpose of studying the nature of phase transitions in two dimensional systems. Much progress has been made recently both in substrate properties and in diffraction technique. Especially the application of synchrotron X-ray diffraction has been important and has increased the range over which correlations can be measured by almost an order of magnitude. The authors show examples of experimental results from X-ray and neutron diffraction studies of melting and commensurate-incommensurate transitions in adsorbed films. (24 refs.)

62270 Tunneling spectroscopy as a probe of adsorbate-surface interactions. P.K.Hansma (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.163-74 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Tunneling spectroscopy is a sensitive probe of two classes of adsorbate-surface interactions: interactions of the adsorbate with the substrate on which it is adsorbed and adsorbate interactions with the top metal electrode that is evaporated on top of it. The author focuses on the second class. In general, the interaction of the adsorbed molecules with the top metal electrode produces a down-shift in the vibrational mode position ranging in size from $\leq 0.1\%$ to $\leq 10\%$ depending on the dipole derivative of the mode and the type of top metal electrode. (14 refs.)

62271 The interaction of ions and easily ionized species with oxide surfaces as studied by tunneling spectroscopy. K.W.Hipps (Dept. of Chem., Washington State Univ., Pullman, WA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.175-88 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The thin film properties of alumina and magnesia, the substrates most frequently used in tunneling spectroscopy, are reviewed. The composite barriers, Al_2O_3/SiO_2 and Al_2O_3/Si , are also discussed. Tunneling studies provide information about adsorbate-surface interactions; weak counterion adsorption effects through very strong direct chemical modifications can be studied. Tunneling studies of anionic transition metal complexes adsorbed on alumina provide significantly more information about the nature of the surface species than corresponding IR studies. The adsorption of TCNE on alumina from solution is used to exemplify how tunneling spectroscopy may be integrated into a manifold of conventional techniques (IR, ESR, and elution studies in this case). (37 refs.)

62272 Inelastic neutron scattering study of hydrogen adsorbed on impure palladium black. J.J.Braid, J.Howard (Dept. of Chem., Univ. of Durham, Durham, England), J.Tomkinson.

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.2, p.253-62 (Feb. 1983). The incoherent inelastic neutron scattering (INS) spectra of hydrogen strongly chemisorbed on Pd black have been obtained (77K) without interference from absorbed or type-C adsorbed hydrogen. The spectra were assigned by comparison with the vibrational spectra of transition-metal hydridecarbonyl compounds and from the change in intensity of the INS bands with surface coverage. Only coverages greater than one monolayer were studied. The data indicate the occupation by H of two-fold bridging and terminal sites, the relative population of the terminal sites increasing at higher hydrogen coverage. (19 refs.)

62273 Corrugation studies for $p(2 \times 2)$ and $c(2 \times 2)$ phases of oxygen on Ni(001) and Cu(001). J.A.Barker, I.P.Batra (IBM Res. Lab., San Jose, CA, USA).

Phys. Rev. B (USA), vol.27, no.6, p.3138-43 (15 March 1983). Chemisorption of oxygen on Ni(001) shows $p(2 \times 2)$ low-energy electron diffraction (LEED) patterns at low exposures changing to $c(2 \times 2)$ at higher exposures. A recent quantum-mechanical cluster calculation and a lattice-dynamical calculation have suggested different vertical heights for the two phases of oxygen. Another ab initio cluster calculation and extended X-ray absorption fine-structure data indicate a single vertical height, in agreement with earlier LEED studies. More recent LEED calculations, however, do not rule out a closer distance for the $c(2 \times 2)$ phase. A He-diffraction study has just been completed for the $c(2 \times 2)$ and $p(2 \times 2)$ phases. The authors compare their calculated corrugation with these data and conclude that in both phases oxygen is at a vertical distance of about 0.9 Å. They predict similar results for oxygen on Cu(001). (25 refs.)

62274 Structure of potassium films on the (1010) face of rhenium. Ya.B.Lozoviy (Ivan Franko State Univ., Lvov, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.9, p.1505-6 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2655-7 (Sept. 1982). [received: April 1983]

Low-energy electron diffraction and contact potential methods were used to study the structure, work function, and thermal stability of potassium films on the (1010) face of rhenium. Throughout the investigated range of first layer coverage $2.5 \times 10^{14} < n < 6.15 \times 10^{14} \text{ cm}^{-2}$, the films have a centered structure $c(2 \times 1)/\sqrt{3}$, where $\sqrt{3} = n/n_{\text{re}}$, n is the potassium atom concentration, and n_{re} the concentration of rhenium atoms on the (1010) face. The minimum work function corresponds to the $c(2 \times 2)$ structure. A monolayer of potassium has the structure $c(2 \times 4)/3$. The second layer grows on the first as islands of the centered structure $c(2 \times \sim 1.7)$. (11 refs.)

62275 Hydration and dehydration of the surface of fused silica. A.A.Kuznetsov, A.P.Kuleshov. *Sov. J. Opt. Technol. (USA)*, vol.49, no.7, p.463-4 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.59-60 (July 1982). [received: April 1983]

It is shown that physical sorption and chemisorption proceed simultaneously on the surface of fused silica and that the thickness of the water layer on the surface fluctuates within the limits 14-86 Å, depending on the atmospheric humidity. (7 refs.)

62276 Observation of an orientational polarizability of dipolar molecules adsorbed in fine-pore membranes. V.A.Kravchenko, Yu.N.Petrov, V.I.Kuznetsov, R.Alexandrescu, N.Comanici, I.Mihaiulescu, I.Morjan. *Sov. Tech. Phys. Lett. (Fiz.) (USSR)*, vol.8, no.13-14, p.848-52 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.848-52 (July 1982). [received: April 1983]

The fact that adsorbate molecules can be oriented during adsorption should cause the polarizability at IR frequencies of a porous sample having such an adsorbate to be significantly higher than that of a clean sample, because of the appearance of an orientational polarizability and thus an increase in the refractive index n at these frequencies. The authors have studied the sorption of molecules with various dipole moments (air, CO_2 , CCl_4 , H_2O , C_2H_6 , CH_3I , C_5H_5N , C_7H_6O , CH_3CN , $C_6H_5NO_2$) in fine-pore mica and in a fine-pore polymer film. The membranes were fabricated by bombarding mica and film samples with the nuclei of heavy elements and then subjecting the resulting defective structures to chemical etching. (2 refs.)

62277 IR spectroscopic and gravimetric investigation of adsorption of acetonitrile on a disperse model glass system. W.Oertel, U.Munch, R.Reppold, R.Strubl, S.Herzog, O.Vogel, I.Plötzki, H.Dunken, P.Fink (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Universität Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.1025-30 (1982). In German.

The adsorption of acetonitrile is investigated on disperse model-glasses (BaO/SiO_2 , B_2O_3/SiO_2 and $K_2O/B_2O_3/SiO_2$) by means of infrared spectroscopy and gravimetry. Samples with BaO and K_2O shows a higher capacity of adsorption than $B_2O_3-SiO_2$. The different strength of surface sites can be detected by means of acetonitrile-adsorption. (9 refs.)

62278 Identification of arsenic surface species on the Si(100) surface. S.C.Perino, C.R.Helms (Dept. of Electrical Engng., Stanford Univ., Stanford, CA, USA).

Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.147-51

The molecular character of arsenic adsorbed on the Si (100) surface has been investigated using thermal desorption spectroscopy (TDS) and Auger electron spectroscopy (AES). A variety of arsenic surface species were deposited on the silicon surface by employing different evaporation sources, including metallic arsenic, arsine gas, and chips of GaAs crystals. The authors present coverage dependent spectra showing the desorption of As_4 tetramers at 350°C and As_2 dimers at 900°C. The loosely bound arsenic is adsorbed from the

solid evaporation sources only and resides on the surface as tetramers. The tightly bound arsenic does not form multiple layers and the high desorption temperatures suggests the adsorbed arsenic exists as monomers. (19 refs.)

68.48 SOLID-SOLID INTERFACES

(inc. bicrystals; for grain boundaries, see 61.70N)

- 62279 Interfaces structure in relation with the mechanisms in the reaction copper-silicon. G.Weber, B.Gillot, P.Barret (Lab. de Recherches sur la Reactivité des Solides, CNRS, Mirande, Dijon, France). *Phys. Status Solidi a (Germany)*, vol.75, no.2, p.567-76 (16 Feb. 1983). The formation of $\eta\text{-Cu}_3\text{Si}$ precipitates on (100) and (111) silicon surfaces by reaction between silicon and cuprous chloride is studied. The precipitates are found to be crystallized epitaxially onto the single crystal substrate and have a geometrical pyramidal structure with a square (on the (100)_{Si} surface) or triangular (on the (111)_{Si} surface) shape with a pyramidal basis plane. In both cases the main growth direction is (110). The good epitaxial growth of $\eta\text{-Cu}_3\text{Si}$ is explained by the easy extraction of silicon atoms by chlorine which facilitates the nucleation and growth at (111)_{Si}- Cu_3Si interface. (18 refs.)

- 62280 On depth profiling an InGaAsP-InP heterojunction. R.Landers, F.C.Prince, V.S.Sundaram, N.B.Patel (Inst. de Física 'Gleb Wataghin', Univ. Estadual de Campinas, Campinas, Brazil). *Surf. & Interface Anal. (GB)*, vol.5, no.1, p.2-3 (Feb. 1983). An $\text{In}_{0.71}\text{Ga}_{0.29}\text{As}_{0.63}\text{P}_{0.37}/\text{In}_{0.97}\text{Ga}_{0.03}\text{As}_{0.10}\text{P}_{0.90}$ liquid phase epitaxy (LPE) grown low lattice mismatch ($\Delta a/a \leq 0.03\%$) interface has been profiled using 1 keV argon ions incident at 50° to sample surface normal in a commercial Varian Auger system. It was found that an interface width of 160 Å from P (120 eV) Auger peak intensities. (5 refs.)

68.55 THIN FILM GROWTH, STRUCTURE, AND EPITAXY

(for techniques of crystal growth and film deposition, see 81.10 and 81.15)

- 62281 X-ray diffraction intensity ratio method for the thickness measurement of ternary heterogeneous epitaxial layers on GaAs substrate. Yang Chuanzheng (Shanghai Inst. of Metall., Acad. Sinica, Shanghai, China). *Chin. J. Semicond. (China)*, vol.4, no.2, p.154-60 (March 1983). In Chinese. On the basis of symmetric Bragg reflection and dynamic diffraction and kinematic absorption, equations of each layer's thickness connected with the intensity ratios of certain X-ray diffraction lines have been derived for system with multipatixial layers on GaAs substrate. The values of intensity ratio are measured experimentally by X-ray diffraction. Consequently, the thickness of various epitaxial layers can be determined. The measured results considered kinematic absorption and agree fairly well with the cleavage method. Finally, the effect of various factors on the measured results is discussed briefly. (11 refs.)
- 62282 Synthesis of $\text{Al}_5\text{Nb}_3\text{Ge}$ by pulsed laser annealing. H.Asano, K.Nakamura, A.Terada (Ibaraki Electrical Communication lab., Nippon Telegraph & Telephone Public Corp., Ibaraki, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.3, p.429-36 (March 1983). Poly-crystalline $\text{Al}_5\text{Nb}_3\text{Ge}$ with an abnormally small lattice parameter of 5.115 Å has been synthesized by illuminating Q-switched ruby laser pulses onto sputter-deposited Nb_2Ge films. A new kind of Al5 phase growth was detected in the X-ray diffraction patterns for films having different structures (amorphous Nb_2Ge , a mixture of amorphous Nb_2Ge and $\text{Al}_5\text{Nb}_3\text{Ge}$, and a mixture of $\text{Al}_5\text{Nb}_3\text{Ge}$ and hexagonal Nb_2Ge_3). Volume increased in the new Al5 phase due to the repeated laser pulse illumination. Electron microscopic studies also confirmed the growth of the new Al5 phase. In addition, oxygen diffusion within a near-surface layer about 1000 Å thick was detected in films illuminated in air. The maximum of superconducting transition onset was 8.5K. These results are discussed in this paper from the standpoint of the surface melting model of the pulsed laser annealing.
- 62283 Liquid-phase epitaxial growth of ZnSe on ZrTe substrate. H.Nakamura, Liang Yan Sun, A.Asano, Y.Nakamura, M.Washiyama, M.Aoki (Dept. of Electronic Engng., Univ. of Tokyo, Tokyo, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.3, p.499-503 (March 1983). Epitaxial layers of ZnSe were grown on ZrTe substrates using a liquid-phase epitaxial growth (LPE) method. A presynthesized Te-Se solution was used as a solvent for LPE. Growth was done in an evacuated quartz tube by a tipping method. The Zn-Se-Te ternary phase diagram was also determined in order to take the basic data of the LPE growth. The ZnSe/ZrTe heterostructure showed fairly good photovoltaic properties. The open-circuit voltage was 0.9 V and the ZnSe epilayer was effective as a window material of the solar cell. (8 refs.)
- 62284 Micro-probe reflection high-energy electron diffraction technique. III. Observation of polycrystalline silicon film on crystalline silicon substrate irradiated by continuous-wave Ar^+ -laser. M.Ichikawa, M.Ohkura, K.Hayakawa (Central Res. Lab., Hitachi Ltd., Tokyo, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.3, p.527-33 (March 1983). For pt.II see *ibid.*, vol.21, p.154 (1982). A micro-probe reflection high-energy electron diffraction (micro-probe RHEED) technique has been used to observe polycrystalline Si film on crystalline Si substrate irradiated by continuous-wave Ar^+ -laser. Dependency of degree of crystallization on laser irradiation conditions has been examined in detail by making areas irradiated under various conditions on the same sample surface. Two kinds of crystalline states have been found on the irradiated areas. The degree of crystallization of one is nearly equal, and the other inferior, to that of crystalline Si substrate. As laser power decreases and laser scan speed increases, the latter kind of crystalline state becomes predominant in the irradiated areas. These results show that the micro-probe RHEED technique is useful in studying crystal growth of materials whose surfaces can not be physically cleaned in order to maintain the initial crystal state. (24 refs.)
- 62285 Measurements of the lamellar spacings of unidirectionally solidified Fe-FeS eutectic thin films. N.Asahi (Dept. of Phys., Sci. Univ. of Tokyo, Chiba, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.3, p.543 (March 1983). Previously the authors (see *ibid.*, vol.21, p.L71, 1982) reported that, when hypoeutectic and hyper-eutectic Fe-FeSi thin films are unidirectionally solidified by controlling appropriately the solidification rates and temperature gradient in the melt at the liquid-solid interface, lamellar structures are observed on the specimen surface. It has been known that for many lamellar growth alloys the lamellar spacing, S , varies with the solidification rate, R , according to the equation $S=A/\sqrt{R}$, where A is a constant. However, no measurement of the lamellar spacings for eutectic thin films have been made yet. In the

present experiment, lamellar spacings in the films of Fe-FeSi eutectic alloys were examined as a function of the solidification rate. It was found that the above equation is applicable to Fe-FeSi eutectic thin films. (7 refs.)

62286 Hydrogen incorporation scheme in amorphous-microcrystalline mixed-phase Si-H films. M.Kumeda, Y.Yonezawa, K.Nakazawa, S.Ueda, T.Shimizu (Dept. of Electronics, Faculty of Technol., Kanazawa Univ., Kanazawa, Japan).

Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L194-6 (March 1983). Silicon-hydrogen alloy films containing both microcrystalline phase and amorphous phase (μ -Si:H) are prepared by sputtering, magnetron sputtering and glow discharge methods. Results of NMR measurements for hydrogen in μ -Si:H are qualitatively similar to those in amorphous silicon-hydrogen alloy films except that hydrogens are easy to move and exhibit the motional narrowing effect. There seems to be little possibility of presence of a large amount of nonbonded hydrogens such as hydrogen molecules or atomic hydrogens.

62287 Morphology and composition of films based on gold on the surface of gallium arsenide during vacuum annealing. T.A.Bryantseva, I.N.Sveshnikova, A.B.Ormont, S.A.Semiletov (Inst. of Radiotechnol. & Electronics, Acad. of Sci., USSR).

Inorg. Mater. (USA), vol.18, no.5, p.613-17 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.724-8 (May 1982). [received: Feb. 1983]

X-ray microprobe analysis and scanning electron microscopy as well as direct observation under the optical microscope have been used to study the changes in the morphology and composition of layers of gold on gallium arsenide during thermal annealing under vacuum. It has been found that the morphology of thin layers of gold of its alloys on gallium arsenide depend on the composition which changes significantly when the samples are heated in vacuum, due to interaction with GaAs and the evaporation of As and Ga from the surface of the specimens. Ruptures are formed in the film and droplets during annealing, followed by crystallization (formation of oriented islets) and the formation of a more or less coherent layer. This sequence can repeat itself with increasing temperature. At annealing temperatures of 690-800 and 848-70K, cathodoluminescence with a wavelength of 0.4 μ m has been observed, indicating the formation of β -Ga₂O₃. (12 refs.)

62288 Structure of pyrolytic carbon in the process of its formation.

Yu.N.Lebedev, E.S.Shmakova, V.N.Sushin. *Inorg. Mater. (USA)*, vol.18, no.5, p.666-8 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.792-4 (May 1982). [received: Feb. 1983]

The deposition of pyrolytic carbon during pyrolysis of methane and the structure of the pyrolytic carbon layer were studied on a high-temperature X-ray apparatus. During the study of the kinetics of the deposition process, it was found that the effective activation energy of the deposition of the pyrolytic carbon during the pyrolysis of methane in the temperature range of 1500-2300°C is 260 kJ/mole. When the pyrolytic carbon layer cools from the temperature of preparation to room temperature, the level of microstrains inside the crystallites decreases. (5 refs.)

62289 Quantitative analysis of fiber texture in cubic films. S.Rao, C.R.Houska (Dept. of Materials Engng., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).

J. Appl. Phys. (USA), vol.54, no.4, p.1872-82 (April 1983). The method of Roe and Krigbaum for determining fiber texture has been extended to thin film applications. It is often desirable to make in situ pole density measurements of a film on a thick substrate. This does not permit complete data to be collected by X-ray transmission techniques. If the data are restricted to the range $0 \leq \chi \leq 75^\circ$, obtained by reflection, incomplete pole density plots are obtained, and it is necessary to devise a self-consistent extrapolation technique that extends the pole density data to 90° . This requires least-squares fitting over the range from $\chi=0$ to 75° and an iterative procedure for extrapolating with functions consistent with a single orientation function. The example of a 1.14- μ Mo film on a (111) Si substrate requires an expansion of the symmetry relations to order 46. The procedure established herein is readily extended to include the effect of static displacements resulting from embedded gas atoms that are associated with sputtered films. (11 refs.)

62290 Electrodeposition of tantalum carbide coatings from molten salts. K.H.Stern, S.T.Gadomski (Chem. Div., Naval Res. Lab., Washington, DC, USA).

J. Electrochem. Soc. (USA), vol.130, no.2, p.300-5 (Feb. 1983). Adherent tantalum carbide coatings have been deposited on nickel substrates from a ternary (Li₂Na₂K)₂F eutectic containing a few percent each of K₂TaF₇ and K₂CO₃. Tantalum and carbon are deposited simultaneously on the nickel cathode where they react to form the carbide at 750°-800°. The coatings are highly resistant to abrasion and are thermally stable to ~600°. (11 refs.)

62291 Electrodeposition of nickel by an asymmetric periodically reversed step current. O.Teschke, D.Menez Soares (Inst. de Física, Lab. Hidrogenio, UNICAMP, Sao Paulo, Brazil).

J. Electrochem. Soc. (USA), vol.130, no.2, p.306-10 (Feb. 1983). The authors report the investigation of high current density (~ 0.15 A/cm²) nickel electrodeposition with a periodically reversed step current and the characterization of the surface morphology of the coatings thus produced. The deposits show micro-structure coherency, characteristics of columnar growth, diameter and shape of growth features, and porosity, which are current controlled. For the same total deposited mass, the deposit thickness is shown to be a function of periodically reversed step current parameters. The control of deposit layers allows the fabrication of nickel coatings with well-defined mechanical and electrocatalytic properties. (11 refs.)

62292 On the reaction mechanism of GaAs MOCVD. J.Nishizawa, T.Kurabayashi (Res. Inst. of Electrical Communication, Tohoku Univ., Sendai, Japan).

J. Electrochem. Soc. (USA), vol.130, no.2, p.413-17 (Feb. 1983). The reaction mechanisms of GaAs metalorganic chemical vapor deposition (MOCVD) have been investigated using infrared absorption spectroscopy. The growth of GaAs from Ga(CH₃)₃ and AsH₃ under H₂ gas atmosphere in a hot wall reactor was studied. The compositions of gases which are sampled through a quartz capillary are observed by infrared spectroscopy. Infrared spectra of (Ga(CH₃)₃+H₂), (AsH₃+H₂), and (Ga(CH₃)₃+AsH₃+H₂) systems were measured in the range from room temperature to 930°C. In the (Ga(CH₃)₃+AsH₃+H₂) system, a new absorption peak at 2080 cm⁻¹ which exists in neither the (Ga(CH₃)₃+H₂) nor the (AsH₃+H₂) system is observed. In the (AsH₃+H₂) system, when Ga(CH₃)₃ is added into the reacting gas, the concentration of AsH₃ decreases drastically. The decomposition of AsH₃ is affected strongly by the addition of Ga(CH₃)₃. (8 refs.)

62293 He⁺ backscattering study on Ar distribution in amorphous magnetic thin films. N.S.Kazama, H.Fujimori, S.Yamaguchi, Y.Fujino (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.214-16 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Ar concentration in thin films introduced through Ar sputtering is examined by means of He⁺ ion backscattering. A considerable amount of Ar is entrapped and distributed uniformly in amorphous Si and amorphous Fe-Co alloys with metalloids, while no trace of Ar can be detected in crystalline Fe. (2 refs.)

62294 Structure and magnetism of insoluble Pb-Fe alloy films. Y.Asada, H.Nose (Nat. Res. Inst. for Metals, Tokyo, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.229-31 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The amorphous mixture film of Pb and Fe is obtained for the first time by simultaneously depositing them on a substrate kept at liquid nitrogen temperature. Pb-rich agglomerates, however, have been observed in the film deposited at room temperature. Ferromagnetic resonances have been observed in both films. (2 refs.)

62295 Columnar growth in evaporated iron films. H.Fujiwara, K.Hara, M.Kamiya, T.Hashimoto, K.Okamoto (Dept. of Materials Sci., Hiroshima Univ., Hiroshima, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.296-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The columnar grain structure of iron-film evaporated in the pressure range between 10^{-2} and 10^{-8} Torr was investigated. From electron micrographs, measurements of extinction coefficient and deviation angle of easy axis from the film plane, it was found that the movement of adatoms plays an important role for the columnar formation. (9 refs.)

62296 EuS ferromagnetic semiconductor films grown epitaxially on silicon. W.Zinn, B.Saif, N.Rasula, M.Mirabal, J.Kohne (Inst. für Festkörperforschung, KFA Jülich, Jülich, Germany).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.329-35 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Results on EuS(111), (100), and (110) single crystal films, (EuS/SrS)(111) layered structures, Eu₂Sr_{1-x}S mixed crystal films, and EuS/Pb sandwiches grown by molecular beam epitaxy (MBE) on substrates of silicon crystals are reviewed. From electron diffraction and Rutherford backscattering studies their stoichiometry and crystal perfection are shown to be of good MBE quality. The magnetic properties reveal the expected magnetic anisotropy axes. The remagnetization and susceptibility behaviour of layered and mixed films are compared with typical single crystal film and bulk data. First results on coupled states of EuS/Pb sandwich films are reported. (23 refs.)

62297 Synthesis of AlSb by laser and capacitive discharge annealing. L.Baufay, R.Andrew, A.Pigeolet, L.D.Laude (Univ. de l'Etat, Mons, Belgium).

Rev. Phys. Appl. (France), vol.18, no.4, p.207-12 (April 1983). In French. The preparation of AlSb films by pulsed laser is compared with a capacity discharge annealing of Al/Sb sandwiches in order to shed light upon the nature of the transformation. Using 1000 Å thick multilayer films supported by glass substrates, the authors investigate the energy threshold for complete transformation as a function of (laser or capacity discharge) pulse duration from 10^{-7} to 10^{-1} s. They calculate the temperature raise directly induced by the energy pulse to be, in the two regimes, at least 900K, which is approximately the melting points of the metallic components. (11 refs.)

62298 Dependence of the carbon density on an epitaxial GaAs film surface on the substrate orientation relative to the crystallographic plane. N.N.Loiko, S.N.Maksimovskii, E.L.Nolle, I.A.Penin, A.E.Petrov, A.G.Tur'yanskii (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1471-2 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2595-8 (Sept. 1982). [received: April 1983] It is established that when a gallium arsenide film is simultaneously heated and exposed to light in its intrinsic absorption band, the carbon density on its surface is substantially lower than if heat treatment is used. It is shown further that the density of the carbon remaining on the film surface after the joint thermal and optical treatment depends on the misorientation angle of the substrate relative to the crystallographic plane, and decreases with decreasing misorientation angle. (9 refs.)

62299 The hydrides, nitrides, and carbides of nickel. R.V.Baranova, Yu.P.Khodyrev, S.A.Semiletov (Inst. of Crystallography, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.554-6 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.923-7 (Sept.-Oct. 1982). [received: April 1983]

In the authors' experiments, nickel films are reacted with ammonia and treated in a nitrogen discharge. It was observed that the nitrides Ni₃N (hexagonal, $a=4.59$ Å, $c=4.31$ Å) and Ni₂N (cubic, $a=3.64$ -3.74 Å) are formed; these had previously been obtained by treating nickel in a discharge of commercial hydrogen. The formation of a nitride with a small hexagonal unit cell ($a \sim 2.6$ Å, $c \sim 4.3$ Å) was not recorded. Analysis of the literature data revealed that it was probably a mistake to assign a hexagonal lattice with parameters $a \sim 2.6$, $c \sim 4.3$ Å to nickel carbide Ni₃C and other related interstitial phases. (20 refs.)

62300 Orientational relations in heteroepitaxial structures (001)W/(1012)Al₂O₃. B.A.Malyukov, M.V.Surovnikov, N.M.Balalaeva.

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.614-15 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1022-4 (Sept.-Oct. 1982). [received: April 1983] In (001)W/(1012)Al₂O₃, the disorientation effect is particularly well marked—the disorientation angle δ is greater than 4°. Sapphire substrates were cut from single crystals grown by the Kyropoulos method. The authors prepared 18 sapphire plates with surfaces variously disoriented relative to the (1012)Al₂O₃ plane; in no case did the angle α exceed 3°. The azimuthal orientation of the specimens was determined by means of the X-ray reflection from the (2021)Al₂O₃ plane. For each substrate the components α_x , α_y of the vector α were found: $\alpha = N - n_{(1012)}$, where N is a unit normal to the surface of the sapphire substrate. It is seen that the angle α between the vectors N and $n_{(1012)}$ satisfies the condition $\alpha \approx |\alpha|$. (8 refs.)

62301 Influence of doping with isovalent impurities on defect formation in homoepitaxial GaAs layers. N.V.Ganina, M.G.Mil'vidskii, A.N.Sherashkov, T.G.Yugova (State Sci.-Res. & Design Inst. of Rare-Metals Industry, USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.616-18 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1025-7 (Sept.-Oct. 1982). [received: April 1983]

Discusses the formation of defects in homoepitaxial layers of GaAs doped with In and Sb. The doped layers were obtained by liquid-phase epitaxy with forced cooling. Growth was effected in two regimes: with the temperature falling through 200-250°C (1) and with the temperature falling through 20°C (2). The temperature of onset of epitaxy ranged from 750 to 900°C. Layers were obtained on substrates of semiinsulating GaAs doped with Cr and In. The substrates were oriented in the (100) plane; their dislocation densities were about $2 \times 10^4 \text{ cm}^{-2}$. The In and Sb concentrations in the layers were determined by X-ray spectral microanalysis. Dislocations in the epitaxial structures were revealed by etching in fused KOH. The distribution of dislocations through the thickness of the films was monitored on oblique sections cut at 3° to the surface of the film. (7 refs.)

62302 Influence of growth rate of epitaxial silicon layers on surface segregation of boron, phosphorus, and arsenic. N.A.Alyabina, R.G.Loginova, M.I.Ovsyannikov (Res. Physicotech. Inst., Gor'kii, USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.618-19 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1028-30 (Sept.-Oct. 1982). [received: April 1983]

Epitaxial layers of silicon were deposited by sublimations in a vacuum of about 10^{-7} torr. The chosen dopants were boron, phosphorus, and arsenic. The substrates were plates of silicon in the (111), (110), and (100) orientations, cut from strongly doped single crystals of the p and n conductivity types for deposition of p-type and n-type layers, respectively. The sources were cut from single crystals of silicon doped with the above impurities to a level of about 10^{19} cm^{-3} . The substrates and sources were subjected to standard mechanical and chemical treatment before being placed in the working chamber. The width of the transition regions was determined from the impurity profiles of the structures, which were recorded by means of the results of C-V measurements of the MOS structures with successive removal of layers by anodic oxidation. The impurity profiles were constructed with the C-V measurement results corrected for screening of the field by mobile carriers. (10 refs.)

62303 Internal stresses in thin Ge, ZnS, and ZnSe films. A.G.Gusev, E.A.Nesmelov, A.S.Nikitin, I.S.Gainutdinov.

Sov. J. Opt. Technol. (USA), vol.49, no.8, p.508-10 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.35-7 (Aug. 1982). [received: April 1983]

The effect of sputtering conditions—substrate temperature and action of high-density light—on the magnitude of the internal stresses in thin Ge, ZnS and ZnSe films has been investigated. It is shown that by varying these conditions one can obtain films having minimum internal stresses. (12 refs.)

62304 The role of Joule heating in liquid phase electroepitaxy. A.N.Barchuk, A.I.Ivashchenko (S. Lazo Polytech. Inst., Kishinev, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1153-6 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1878-82 (Sept. 1982). [received: April 1983]

The temperature distribution at the crystallization front has been analyzed for a cylindrical growth cell for conditions which accurately reproduce experimental conditions. It is shown that heating of the crystallization front caused by the evolution of Joule heat in liquid phase electroepitaxy is fundamentally nonuniform and the contribution of convection in the melt in the typical situation is insignificant. The effect of the cross section of the growth cell and the resistivity of the semiconductor substrate on the temperature of the melt-substrate contact is also discussed. The results of the analysis make it possible to account for a number of phenomena peculiar to electroepitaxy, namely, the 'edge' effect, the appreciable nonplanarity of the epitaxial films, and the connection between the limitations of the current density in electroepitaxy and the area of the melt-substrate contact. (15 refs.)

62305 Theory of current control of the distribution of the composition over thickness in $\text{AlGa}_{1-x}\text{As}$ epitaxial films. S.Yu.Karpov, M.G.Mil'vidskii, S.A.Nikishin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.7, p.383-4 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.883-7 (July 1982). [received: April 1983]

The authors derive a theoretical description of electroliquid epitaxy from a bounded volume of melt, taking into account the depletion of the liquid phase during the crystallization and the replenishment of the liquid phase through dissolution of the source. (7 refs.)

62306 X-ray diffraction analysis of SnO_2 films prepared by oxidation of tin films. N.P.Sinha, M.Misra (Dept. of Phys., Univ. of Gorakhpur, Gorakhpur, India).

Thin Solid Films (Switzerland), vol.101, no.2, p.L33-4 (11 March 1983).

Tin (99.99% pure) was evaporated onto thoroughly cleaned optically flat photographic glass plates in a vacuum of the order of 10^{-6} Torr. The thickness of the tin films was 20000 Å. These films were then heated in an oxygen atmosphere for about 90 min. Oxidation of the tin films was carried out at five different heating temperatures: 300, 350, 400, 450, and 500°C. X-ray diffraction analysis of these films was carried out on a GE-XRD-5 diffractometer. At lower oxidation temperatures (300°C) the film is amorphous. This may arise as complete oxidation does not take place and some part of the film remains as insulating SnO . However, at higher oxidation temperatures (350, 400 and 500°C) the films were found to be polycrystalline. In the X-ray spectra, the maximum intensity observed at different angles varies with the oxidation temperature. As the oxidation temperature is increased the intensity of the peaks in the diffraction pattern also increases indicating that at higher oxidation temperatures the films are more polycrystalline with larger grain sizes. It appears that oxidation proceeds well at higher temperatures and nearly stoichiometric films of SnO_2 are formed. (10 refs.)

62307 Layered Pb/Ag films. M.Jalochowski (Dept. of Experimental Phys., Univ. of Marie Curie-Skłodowska, Lublin, Poland).

Thin Solid Films (Switzerland), vol.101, no.4, p.285-9 (25 March 1983).

Thin layered structures were produced by sequential vacuum evaporation of lead and silver. The layered samples showed strong [111] texture. The X-ray diffraction plots contained a series of additional satellite peaks characteristic of a superlattice. The experimental X-ray diffraction data and results of calculations based on a simple model of a superlattice were compared. The influence of room temperature annealing on the crystal structure of the layered Pb/Ag samples was observed. (15 refs.)

62308 Crystal, impurity-related and growth defects in molecular beam epitaxial GaAs layers. M.Balleur, A.Munoz-Yague (Lab. d'Automatique et d'Analyse des Systemes, CNRS, Toulouse, France).

Thin Solid Films (Switzerland), vol.101, no.4, p.299-310 (25 March 1983).

Crystallographic defects in GaAs layers grown by molecular beam epitaxy were studied. The methods used were photochemical etching, developed previously, and also optical and scanning electron microscopy. Dislocation, stacking faults, impurity microprecipitates and impurity out-diffusion from the substrate were observed. Large growth defects, namely oval defects and whiskers, were also studied using selective etching, transmission electron microscopy and electron microprobe analysis. The roles of the substrate quality, handling, surface preparation and epitaxial growth conditions were considered in connection with the formation of the crystallographic defects. (19 refs.)

62309 LiInSe_2 thin epitaxial films on $\{111\}$ A-oriented GaAs. A.Tempel, B.Schumann, S.Mitaray, G.Kuhn (Sektion Chem., Karl-Marx-Universität, Leipzig, Germany).

Thin Solid Films (Switzerland), vol.101, no.4, p.339-44 (25 March 1983).

LiInSe_2 thin epitaxial layers were prepared by flash evaporation on $\{111\}$ A-oriented GaAs substrates and investigated by reflection high energy electron diffraction. The overgrowth is characterized by one-dimensional epitaxy with preferred azimuthal orientation. In general, the LiInSe_2 thin films crystallize in the $\beta\text{-NaFeO}_2$ structure. In the substrate temperature range from 620 to 670K a second phase with chalcopyrite structure was observed besides the $\beta\text{-NaFeO}_2$ structure. (10 refs.)

62310 Composition distribution in Co-Cr perpendicular magnetic films. R.Sugita (Materials Res. Lab., Matsushita Electric Industrial Co. Ltd., Moriyuchi, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.1, p.55-61 (Jan. 1983). In Japanese.

Composition distribution in Co-Cr perpendicular magnetic films has been analyzed, and the relation between the distribution and magnetic properties of the films has been considered. It was clarified that there was Cr segregation layer at the surface of the columns constructing the columnar structure of the film. The columns have single domain characteristics with the increase of the Cr segregation. The experimental result, that the perpendicular coercive force of the films increased steeply with elevating substrate temperatures at deposition while the films had nearly constant values of c-axis orientation $\Delta\theta_{50}$, could be explained by the Cr segregation. 68.60 PHYSICAL PROPERTIES OF THIN FILMS, NONELECTRONIC

- 62311 Curvature radius and layer stresses for thermal strain in semiconductor multilayer structures. Feng Zhechuan, Liu Hongdu (Dept. of Phys., Peking Univ., Peking, China). *Chin. J. Semicond.* (China), vol.4, no.2, p.171-80 (March 1983). In Chinese. The generalized formula is deduced for the curvature radius and layer stresses for thermal strain in semiconductor multilayer structure with different elastic moduli and growth temperatures, including the case of a substrate with initial curved momentum. Various approximate expressions are given, especially the useful forms for the thick substrate. Using the formulae derived, the active layer stress and its dependence on layer thicknesses and Al fractions are calculated for conventional GaAs-GaAlAs DH lasers and visible buffered GaAlAs DH lasers, the analytical expressions for the vanishing of active layer stress are obtained, the thermal expansion coefficient and Young's modulus of native oxide Ga_2O_3 measured, and the active layer stress due to native oxide and metallic films for MSTO structures calculated. (13 refs.)
- 62312 In situ thin film differential thermal analysis of amorphous V_2O_5 thin films. J.P. Audiere, A. Madi (Lab. de Physicochimie Minérale, Univ. Paris Sud, Orsay, France). *Thin Solid Films* (Switzerland), vol.101, no.2, p.L29-31 (11 March 1983). In situ differential thermal analysis (DTA) experiments were performed on highly quenched amorphous V_2O_5 thin films directly evaporated onto a thin film differential thermocouple microprobe. Irreversible low temperature relaxations were thus evidenced, a result impossible to obtain with a classical DTA apparatus using microcrucibles such as Setaram or Mettler TA 2000 devices. (10 refs.)

68.70 WHISKERS AND DENDRITES: GROWTH, STRUCTURE, AND NONELECTRONIC PROPERTIES

- 62313 Whiskerisation of carbon beads by vapour phase growth of carbon fibres to obtain sea urchin-type particles. M. Egashira, H. Katsuki, Y. Ogawa, S. Kawasumi (Dept. of Materials Sci. & Engng., Nagasaki Univ., Nagasaki, Japan). *Carbon* (GB), vol.21, no.1, p.89-92 (1983). Whiskerisation of sulfur-containing hard carbon beads with carbon fibres has been examined to prepare sea urchin-type particles. Propylene was used as a source material for the fibre growth and decomposed at 1000°C for 2 hr. Sulfur-catalysed carbon fibres 4-6 μm in diameter and 90-120 μm long formed with a density of 400-550 μm per bead on the surfaces of carbon beads containing ≥ 2.5 wt% sulfur. These beads were prepared by carbonisation of styrene/divinylbenzene copolymers sulfonated with fuming sulfuric acid. Very few, if any, fibres grew on beads from copolymers sulfonated with chlorosulfuric acid, probably because of lower sulfur contents (< 2.5 wt%) and/or inhibition by residual chlorine. (18 refs.)

71.10 GENERAL THEORIES AND COMPUTATIONAL TECHNIQUES

- 62314 Generalized pseudopotential model of inhomogeneous systems and its application to a simple-metal surface. P. Streitenberger (Sektion Math. und Phys., Wissenschaftsbereich Tech. Phys., Tech. Hochschule Otto von Guericke, Magdeburg, Germany). *Phys. Status Solidi b* (Germany), vol.116, no.1, p.179-90 (1 March 1983). General expressions in real-space representation are derived for charge density, total energy, and Hellmann-Feynman forces on an ion. They represent a uniform and systematic extension of the pseudopotential or pair-potential model to highly inhomogeneous electron-ion systems. Modifications appear in form of non-central pair potentials and additional one-body potentials arising from the screening in the inhomogeneous electron gas. The corresponding self-consistent charge density results from the superposition of overlapping non-spherical pseudopotentials and an additional charge density that is mainly localized in the defect region. A first application to the simple-metal surface is given where some general results within the jellium model are obtained. (40 refs.)
- 62315 Energy states and Bloch states for an accelerated electron in a periodic lattice. J.N. Churchill, F.E. Holmstrom (General Products Div., IBM Corp., San Jose, CA, USA). *Phys. Scr. (Sweden)*, vol.27, no.2, p.91-8 (Feb. 1983). The Hamiltonian for an accelerated electron in a periodic one-dimensional lattice is written using normalized coordinates. By this means, the exact functional form for the position and energy dependences of the energy eigenstates is obtained without resorting to the usual approximation methods, such as power-series expansions, perturbation procedures or one-band models. Bloch-type wave functions that fully satisfy Schrödinger's time-dependent equation are obtained by superimposing energy eigenstates using the Stark ladder spacing concept. Such phenomena as Bloch oscillations and Stark ladder effects are then re-examined as a consequence of this new perspective. (43 refs.)

71.20 ELECTRONIC DENSITY OF STATES DETERMINATIONS

(inc. energy states of liquid semiconductors; see also 65.40 Lattice and electronic heat capacity)

- 62316 Experimental investigation of the density of states of a quasi-one-dimensional vibrational exciton in isotopically mixed KNO_3 crystals. M.V. Belousov, D.E. Pogarev (Inst. of Phys., A.A. Zhdanov State Univ., Leningrad, USSR). *JETP Lett.* (USA), vol.36, no.5, p.189-91 (5 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz.* (USSR), vol.36, no.5, p.152-5 (5 Sept. 1982). [received: April 1983] The possibility of directly measuring the density of states of a disordered crystal from the spectrum of compound transitions is noted and studied experimentally for the first time. The unusual behavior of the spectrum studied as a function of concentration is explained by the quasi-one-dimensional nature of the band. (8 refs.)
- 62317 A computational method for the evaluation of highly resolved DOS functions from APS measurements. K.-T. Schleicher, S.W. Schulz, R. Gmeiner, H.-U. Chun (Inst. für Theoretische und Physikalische Chem., Univ. Frankfurt, Frankfurt/M., Germany). *J. Electron Spectrosc. & Relat. Phenom.* (Netherlands), vol.31, no.1, p.33-56 (April 1983). A new computational procedure for evaluation of the density of unoccupied states from appearance-potential spectra is described. The data treatment is based on least-squares methods using quadratic spline functions and on a rigorous consideration of the different contributions to the appearance-potential signal. Certain physical, experimental and computational requirements have to be met in order to obtain highly resolved and reliable results. The performance of the computational procedure is demonstrated by application to synthesized spectrum of iron and to a realistic appearance-potential spectrum of polycrystalline ferromagnetic cobalt. In particular, this method provides more detailed information concerning the unoccupied states than previous studies. The position of the unoccupied d -band maximum in cobalt at 0.55 ± 0.15 eV does not agree with any of the greatly differing theoretical calculations in the literature. (39 refs.)
- 62318 Valence-electron density in silicon under high pressure. M.T. Yin (Bell Labs., Murray Hill, NJ, USA), M.L. Cohen. *Phys. Rev. Lett.* (USA), vol.50, no.15, p.1172 (11 April 1983). In a recent Letter (see *ibid.*, vol.49, p.1438, 1982), Yoder-Short, Collella, and Weinstein reported an investigation of high-pressure effects on the valence-electron density in Si and InSb by X-ray diffraction, where the forbidden (222) integrated intensity was found to decrease sharply just before the structural transition in both Si and InSb. They pointed out that this could arise from either a smearing of the bonding charges or an enhancement of phonon anharmonicity and suggested that recent *ab initio* pseudopotential calculations (see *ibid.*, vol.45, p.1004, 1980) may be used to resolve this issue. The authors have performed *ab initio* pseudopotential calculations for various atomic volumes of Si. The calculated X-ray structure factor $F(222)$ of Si at zero temperature is, respectively, 0.3398, 0.3403, 0.3401, 0.3395, 0.3390, 0.3379, and 0.3355 in units of electron per primitive cell for the volume of 1.031, 1.000, 0.971, 0.942, 0.918, 0.889, and 0.840 normalized to the measured free volume, Ω_0 . 71.25 NONLOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

62319 A method in the study of band structure for GAC. Ye Ling, Zhang Kaiming (Modern Phys. Inst., Fudan Univ., Shanghai, China). *Chin. J. Semicond. (China)*, vol.4, no.2, p.117-23 (March 1983). In Chinese. A simpler but self-consistent scheme is proposed for studying the electronic structure of graphite acceptor compounds (GAC). The basic concept of the computer renormalization group (CRG) is applied in simplifying the interactions between graphite and the intercalates, and a 'pseudo-atom' is used to simulate the intercalant molecule. This model enables the authors to study different IC₈ type GAC in the same program, the extended Huckel energy band calculation method is developed and the resulting band structures and Fermi surface properties of GAC (FeCl₃, AsF₅) thus obtained are discussed and compared with the present data. (10 refs.)

62320 Crystalline phase effects on ESCA valence bands of Zr(IV) and Ti(IV) acid phosphates. G.Marletta, O.Puglisi, S.Pignataro (Istituto Dipartimentale di Chimica, Univ. di Catania, Catania, Italy), G.Alberti, U.Costantino. *Polyhedron (GB)*, vol.2, no.3, p.157-62 (1983).

The valence bands (VB) of ESCA spectra of Zr(IV) and Ti(IV) acid phosphates in different crystalline phases are reported. The various bands are assigned by comparison with Li₃PO₄. Variations on changing the crystalline phase for compounds having the same M(IV) ion are found. Two types of molecular orbitals are mainly involved. One related to P-O bonds is affected by the crystalline phase. The other, related to M(IV)-O bonds are confined into the layers of the compounds, are less sensitive to crystalline environment. Variation in the symmetry of the tetrahedral type PO₄³⁻ anion are proposed to be mainly responsible of the observed effects. (38 refs.)

71.25C Techniques of band-structure calculation (general theory, applications of group theory, analytic continuation, etc)

62321 On the Brillouin zone integration. B.I.Reser (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.31-40 (1 March 1983).

A brief and simple description is given of three new methods of integration in the Brillouin zone; direct, ray, and hybrid tetrahedron, proposed by Chen (1977), McDonald et al. (1979). These methods are analyzed in detail in application to the calculation of the density and number of states of SC, BCC, and FCC crystals using tight-binding and empty lattice models. It is shown that all the methods considered exhibit a high accuracy: several hundred initial *k* points in the irreducible part of the Brillouin zone with not very complicated dispersion relations make it possible to calculate such a quantity, as the density of states, with an average error of less than 1%. The hybrid tetrahedron method is proved to be simpler and many times more effective than the other two methods. Only with dispersion relations close to isotropic is the ray method preferable. (9 refs.)

62322 Analytic approximation for random muffin-tin alloys. R.Mills (Dept. of Phys., Ohio State Univ., Columbus, OH, USA), L.J.Gray, T.Kaplan. *Phys. Rev. B (USA)*, vol.27, no.6, p.3252-62 (15 March 1983).

The methods introduced in a previous paper under the name of 'traveling-cluster approximation' (TCA) are applied, in a multiple-scattering approach, to the case of a random muffin-tin substitutional alloy. This permits the iterative part of a self-consistent calculation to be carried out entirely in terms of the on-the-energy-shell scattering amplitudes. Offshell components of the mean resolvent, needed for the calculation of spectral functions, are obtained by standard methods involving single-site scattering wave functions. The single-site TCA is just the usual coherent-potential approximation, expressed in a form particularly suited for iteration. A fixed-point theorem is proved for the general *t*-matrix TCA, ensuring convergence upon iteration to a unique self-consistent solution with the physically essential Herglotz properties. (13 refs.)

62323 Magnetic field dependence of electron density in bismuth. Chhi-Chong Wu (Dept. of Appl. Maths., Nat. Chiao Tung Univ., Hsinchu, Taiwan, China), Mao-Hsiung Chen, Chau-Jy Lin. *J. Phys. C (GB)*, vol.16, no.11, p.L317-21 (20 April 1983).

Using time-independent perturbation theory, the energy eigenvalue equation for a free-electron gas in bismuth with the McClure-Choi modified non-ellipsoidal non-parabolic (MNENP) model in the presence of a uniform DC magnetic field has been solved. The authors investigate the effect of the magnetic field on the electron density at very low temperatures and compare numerical results for this new band model with those for the Cohen NENP (1961), LAX ENP (1958) and EP models. Results show that quantum oscillations of the electron density for the MNENP model appear much more salient and considerable than those for other models. It seems that this MNENP model could be better for describing some physical phenomena of the magnetic field effect in bismuth for the very low-temperature limit. (18 refs.)

62324 Shubnikov-de Haas oscillations in Cd₃(As_{0.7}P_{0.3})₂. E.K.Arushanov, A.V.Lashkul, L.N.Luk'yanova, A.N.Nateprov, S.I.Radautsan, V.V.Sologub (Inst. of Appl. Phys., Acad. of Sci., Kishinev, Moldavian SSR). *Sov. Phys.-Semicond. (USA)*, vol.16, no.10, p.1216-17 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1888-90 (Oct. 1982). [received: April 1983]

The authors studied for the first time the Shubnikov-de Haas (SdH) oscillations in Cd₃(As_{0.7}P_{0.3})₂, determined the topology of the electron Fermi surface, and found the cyclotron effective mass *m*_c of electrons. Single crystals of Cd₃(As_{1-x}P_x)₂ solid solutions were grown from the vapor phase throughout the full composition range. The measurements were carried out at 4.2 and 2.7K in static magnetic fields B up to 6 T. Oscillations of the Hall voltage U_H, longitudinal magnetoresistance Δρ_l/ρ₀(B|C₄), and transverse magnetoresistance Δρ_t/ρ₀(B⊥C₄) were observed at 4.2K, and it was found that the Hall coefficient was independent of the magnetic field to within 10%. The angular dependences of the SdH period P were determined for magnetic field orientations ranging from B₁C₄ to B₁C₄. It was established that the period P did not vary by more than 3%, which was within the limits of the experimental error. (11 refs.)

71.25J Effective mass and g-factors

62325 Altered results for orbital and spin susceptibilities by inclusion of the diamagnetic contribution of the valence electrons in the evaluation of an Einstein de Haas experiment. J.Benkowitz (Kernforschungszentrum Karlsruhe, Inst. für Angewandte Kernphys., Karlsruhe, Germany), H.Winter. *Z. Phys. B (Germany)*, vol.50, no.3, p.217-17 (1983).

The g-factor experiments of Huguenin et al. (see J. Phys. F, vol.1, p.281, 1971) help to separate the spin and orbital susceptibility contributions of paramagnetic transition metals. In the evaluation of the experimental data, these authors took account of the Langevin diamagnetism of the core electrons whereas the valence electrons should be equally recognised for their diamagnetism. The introduction of this valence electron diamagnetism, obtained from band structure data, introduces significant changes of the results, leading to better agreement with other experiments and with theoretical results in most cases. (26 refs.)

62326 Effect of varying the orientation of a quantizing magnetic field on the effective electron mass in degenerate tetragonal semiconductors. A.N.Chakravarti, K.P.Ghatak, K.K.Ghosh, H.M.Mukherjee (Inst. of Radio Phys. & Electronics, Univ. Coll. of Sci. & Technol., Calcutta, India). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.17-24 (1 March 1983). An attempt is made to investigate the effects of varying the orientation of a quantizing magnetic field on the effective mass in tetragonal semiconductors. It is found, taking n-Cd₃As₂ as an example, that the crystal-field splitting results in different effective masses at the Fermi level corresponding to different magnetic sub-bands. These effective masses are found to be significantly influenced by the orientation of the magnetic field with respect to the *c*-axis. This behaviour is further noted to be strongly dependent on the carrier concentration but is relatively much less sensitive to changes in the magnetic field strength. (21 refs.)

71.25M Electron energy states in amorphous and glassy solids

62327 Preliminary study on the electronic structure of hydrogenated and fluorinated amorphous silicon. Jiang Ping (Modern Phys. Inst., Fudan Univ., Shanghai, China).

Chin. J. Semicond. (China), vol.4, no.2, p.133-4 (March 1983). In Chinese. By using a cluster model, the extended Huckel method is used to calculate the electronic states of hydrogenated and fluorinated amorphous silicon. The results calculated show that both hydrogen and fluorine can be used to reduce the gap states associated with dangling bonds, and fluorine is more efficient. The results obtained are in qualitative agreement with experimental measurements. (15 refs.)

62328 Treatment of aperiodicity and correlation in polymers. J.J.Ladik (Dept. of Theoretical Chem., Friedrich-Alexander-Univ., Erlangen-Nurnberg, Germany).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.1073-81 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

The negative factor counting method (in its simple and matrix block form) for the determination of the density of states of disordered polymer chains and its applications to different aperiodic organic polymers are reviewed. The problems of the calculation of the correlation energy in large systems like polymers will be discussed. Different ways for the partitioning of an energy band into regions make it possible to perform Moller-Plesset perturbation theoretical calculations on polymers. Applications to hydrogen chains are presented. Finally, possible applications to disordered polymers are also discussed. (35 refs.)

71.25P Band structure of crystalline metals

62329 Self-consistent semirelativistic pseudopotential calculation of the energy bands, cohesive energy, and bulk modulus of W. D.M. Bylander, L. Kleinman (Dept. of Phys., Univ. of Texas, Austin, TX, USA). *Phys. Rev. B (USA)*, vol.27, no.6, p.3152-9 (15 March 1983). The energy bands, equilibrium lattice constant, cohesive energy, and bulk modulus of tungsten have been calculated using a new semirelativistic pseudopotential. The agreement with experiment is exceptionally good. This can be attributed to the pseudopotential containing all relativistic effects, except spin-orbit, to order α^2 , where α is the fine-structure constant, and by taking the exchange-correlation potential to be $V_{xc}^{\text{val}} = V_{xc}(\rho_{\text{total}}) - V_{xc}(\rho_{\text{core}})$ rather than $V_{xc}^{\text{val}} = V_{xc}(\rho_{\text{val}})$. (27 refs.)

62330 Self-consistent pseudopotential calculation of the electronic structure of PdH and Pd₂H. C.T. Chan, S.G. Louie (Dept. of Phys., Univ. of California, Berkeley, CA, USA). *Phys. Rev. B (USA)*, vol.27, no.6, p.3325-37 (15 March 1983). The electronic structure of PdH and Pd₂H is studied in detail with a fully self-consistent pseudopotential approach using a mixed basis set. The band structure, density of states, angular-momentum-decomposed density of states, and charge densities are analyzed for both systems. Particular attention has been paid to the nature of the Pd-H bonding state and the effect of changing the hydrogen concentration as one goes from PdH to Pd₂H. Agreements with experimental data and previous calculations on PdH are very good. The essential physical nature of the hydride system is summarized in a simple conceptual picture which should be applicable to substoichiometric PdH_x and other hydrides for the prediction of Fermi-surface properties. 71.25R Band structure of crystalline elemental semiconductors

62331 A localized orbital description of Ge and α -Sn. P.V. Smith (Phys. Dept., Univ. of Newcastle, Newcastle, Australia). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.101-9 (1 March 1983). In previous work an accurate description of the band structure and the valence electron pseudo-charge density of Si is given in terms of a small set of well localized basis functions comprising only ten states of s, p, d, and f symmetry per atomic site. Now this work is extended to the case of Ge and α -Sn and it is shown that this localized orbital approach also provides an excellent representation of the electronic structure of these other diamond elemental semiconductors. Moreover, the resulting basis functions are again very well localized about their respective lattice sites. The implications of this work in relation to semiconductor impurity problems are also briefly discussed. (13 refs.)

71.25T Band structure of crystalline semiconductor compounds and insulators

62332 Tight binding calculations for band structures and other electronic properties of GaAs-GaP superlattices. Liu Wenming, Li Jia (Dept. of Semiconductors, Jilin Univ., Jilin, China). *Chin. J. Semicond.* (China), vol.4, no.2, p.124-32 (March 1983). In Chinese. The tight binding method is used to study the band structures and other related electronic properties of GaAs-GaP superlattices. Second nearest neighbor interactions are included in the elements of secular matrices. The bands of superlattice (GaAs)_m(GaP)_n along three main symmetry lines in the Brillouin zone are presented. The energy values at Γ , X and M points are calculated for superlattices (GaAs)_m(GaP)_n where $m+n \leq 10$. Discussions are given for the variations of energy gap as a function of periodic length under the condition $m=n$, for the effect of fraction on the gap with an unchanged periodic length, and for the distributions of electrons in several typical one-electron states. (15 refs.)

62333 A crystal orbital investigation on the one-dimensional bis(glyoximate)pyrazine-iron system. M.C. Bohm (Organisch-Chem. Inst., Univ. Heidelberg, Heidelberg, Germany). *Chem. Phys. (Netherlands)*, vol.76, no.1, p.1-14 (1 April 1983). The band structure of bis(glyoximate)pyrazine-iron (I) has been studied in the crystal orbital (CO) formalism as derived in the tight-binding approximation. The computational framework is a semi-empirical INDO model. Two polymer geometries have been studied; one with long (2.1 Å) Fe-pyrazine distances and one with short (1.8 Å) axial bonds. Both types of one-dimensional materials are insulators, the forbidden band gap exceeds 6.5 eV. The highest filled bands of the unoxidized polymers are glyoximate lone-pair and π functions; Fe 3d bands are predicted 1.5-2.0 eV below the valence band of the transition-metal stack. For partially oxidized modifications of I trapped valences and localized Fe³⁺ hole-states are expected. The INDO CO results are compared with available experimental data and with extended Huckel CO calculations on topologically related transition-metal polymers. (56 refs.)

62334 Determination of band-gap parameters of Hg_{1-x}Cd_xTe based on high-temperature carrier concentration. E. Finkman (Microelectronics Res. Center, Technion-Israel Inst. of Technol., Haifa, Israel). *J. Appl. Phys. (USA)*, vol.54, no.4, p.1883-6 (April 1983). The temperature dependence of the carrier concentration of Hg_{1-x}Cd_xTe at elevated temperatures is used to determine its band parameters near the band edge. The electron concentration is calculated by using the Kane model (k.p method), and is fit to observed values derived from measurements of the Hall coefficient in the near-intrinsic region. This procedure results in expressions for the following parameters: the band-gap E_g and its dependence on temperature and composition; Kane's interband-coupling matrix element and

the heavy-hole effective mass ratio. Modified values of the intrinsic carrier concentration are calculated using these parameters. (20 refs.)

62335 The spin polarisation of conduction electrons in a ferromagnetic semiconductor. D.M. Edwards (Dept. of Maths., Imperial Coll., London, England). *J. Phys. C (GB)*, vol.16, no.11, p.L327-30 (20 April 1983).

It is argued that the 'multiband' model of Nolting (1979, 1980) for the conduction band of a ferromagnetic semiconductor is unrealistic and cannot provide a correct explanation of the spin polarisation of field-emitted electrons from a W-EuS junction. A simple theory is given which shows that the polarisation should be approximately proportional to the magnetisation of the EuS, in reasonable agreement with experiment. (11 refs.)

62336 Bulk and surface electron states in WO₃ and tungsten bronzes. D.W. Bullett (Max-Planck-Institut für Festkörperforschung, Stuttgart, Germany). *J. Phys. C (GB)*, vol.16, no.11, p.2197-207 (20 April 1983).

Calculations of the electronic structure of WO₃ suggest that the detailed crystallographic arrangement determines rather sensitively the size of the semiconducting energy gap. This increases from 1.6 eV in the perovskite-like cubic approximation to the structure, as used in the only previous study, to 2.4 eV in the full monoclinic distorted structure. Valence-band widths and density-of-states peaks are consistent with experimental photoemission spectra. The extra electrons introduced by alkali-metal atoms in the bronzes Na_xWO₃ enter the conduction band of W_{1/2} states, behaving rather like a rigid-band model. Surface states are predicted to be absent from the semiconducting energy gap of the defect-free (001) surface of WO₃. (74 refs.)

62337 Dependence of the band structure of Ge₂(GaAs)_{1-x} solid solutions on the degree of order. A.I. Gubanov, A.M. Polubotko (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1187-9 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1848-51 (Oct. 1982). [received: April 1983]

The authors consider the dependence of the energy band structure of Ge₂(GaAs)_{1-x} solid solutions on the degree of disorder in the case when the Ga and As sublattices are retained. They consider the influence of a structural phase transition on the band structure using the variational LCAO method. (5 refs.)

62338 Electron structure of stoichiometric and nonstoichiometric tungsten oxides. A.L. Gubskii, A.P. Kovtun, V.P. Sachenko. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.3, p.441-9 (March 1983). In Russian.

The SCF X_α-SW method was applied to calculate the electronic structures of several clusters WO₆⁶⁺, W₈O₁₂⁴⁺, W₆O₁₂⁴⁺, W₈O₁₈²⁰⁺ and M₂O₁₂³⁺ where M=Nb, Mo, Ta, Re. It is found that main qualitative electronic structure features in the clusters are similar to those in the crystals according to the Goodenough classification. The conclusion is made that there is a decisive influence of short-range order on the electronic integral characteristics visible in X-ray photoelectron spectra of the valence band. (18 refs.)

71.30 METAL-INSULATOR TRANSITIONS

62339 Effect of electron bombardment on the phase transition in VO₂ films. I.A. Abroyan, V.Ya. Velichko, O.A. Podsvirov, F.A. Chudnovskii. *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.336-7 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.775-8 (July 1982). [received: April 1983]

An effort has recently been undertaken to develop radiation methods for controlling the parameters of the metal-semiconductor phase transition in vanadium dioxide; in particular, the effect of ion bombardment on this phase transition is the subject of active research. There is also considerable interest in the effect of electron bombardment on this phase transition. The authors report a study of the dose dependence of such characteristics of the metal-semiconductor phase transition in VO₂ films as the transition temperature ΔT_1 , its width ΔT_1^0 , and the width of the thermal hysteresis loop ($j=320$ $\mu\text{A}/\text{cm}^2$) in a vacuum of 10^{-4} Pa. The phase-transition parameters were determined from the temperature dependence of the optical reflection coefficient R at the wavelength $\lambda=0.6$ μm over the temperature interval from 283 to 360K. 71.35 EXCITONS AND RELATED PHENOMENA

(inc. electron-hole drops)

62340 Charge and spin locations in linear stacks of TCNQ. L. Shields (School of Chem., Univ. of Bradford, Bradford, England).

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.2, p.243-51 (Feb. 1983). Charge and spin locations in stacks of TCNQ molecular ions are assessed. The fine-structure parameters of localised triplet excitons extending over three and four molecules in the stack are calculated relative to the fine-structure splitting of the TCNQ₂²⁻ dimer: the absence of resolved fine-structure is shown to be insufficient evidence for the absence of localised exciton traps. Both the charge and spin locations are assumed to be especially sensitive to the relative values of the intermolecular charge interaction and electron resonance. Spin magnetic susceptibilities observed in pyridinium TCNQ salts, which may derive from spin traps, spin excitons and free-electrons separately or in combination, are differentiated into these three components. (14 refs.)

62341 Parameters of bound multiexciton complexes in direct polar semiconductors. A. Haufe (Sektion Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany), K. Henneberger, J. Rosler, H.-J. Wunsche. *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.191-203 (1 March 1983). Using a generalized density-functional method, which takes electron-phonon interaction into account, the ground state energies of donor-BMEC's D^NX_m ($m=1, \dots, 20$) are calculated for the polar semiconductors ZnS, CdS, and CdSe. The highest stability is obtained for complexes possessing filled

electron shells ($m=1, 7, 19$), whereas gaps of instability are located between these complexes. The spectral locations of luminescence lines connected with the radiative decay of BMECs are predicted and found to be concentrated between the luminescence lines of the bound exciton and the free exciton. Furthermore, analytic approximate expressions for the electron and hole densities are obtained and their shapes are extensively discussed. (22 refs.)

62342 Exciton trapping and sensitized luminescence: a generalized theory for all trap concentrations. V.M.Kenkre, P.E.Parris (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA). *Phys. Rev. B (USA)*, vol.27, no.6, p.3221-34 (15 March 1983).

The generalized-master-equation theory of sensitized luminescence in molecular crystals is extended to cover arbitrary guest concentrations by making use of a recently introduced formalism. Central to the formalism is a quantity termed the ν function, which is an ensemble average of the sum of host propagators over guest-influenced host sites. A variety of experimentally relevant sensitized luminescence observables, such as the host (and guest) luminescence intensity, the quantum yields, and the energy-transfer rates are simply related to the ν function. It is shown how the latter can be calculated for exciton motion possessing an arbitrary degree of coherence, dimensionality, and other transport characteristics, and for guest-molecule placement represented by any given pair correlation function. Specific cases are treated and results, some exact and others approximate, are presented for experimental observables. (26 refs.)

62343 Energy levels of excitons in cubic crystals. S.M.Zubkova, K.B.Tolpygo, V.G.Filin (Inst. of Problems in Materials Sci., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1466-7 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2585-8 (Sept. 1982). [received: April 1983]

A numerical solution is given for the problem of the lowest energy levels of direct and indirect excitons in crystals having a diamond or zinc blende structure, including the spin-orbit split-off valence band and the anisotropy and nonparabolicity of the conduction band. (11 refs.)

62344 Temperature and kinetics of the exciton and biexciton gas in cadmium sulfide and selenide crystals. G.V.Mikhailov, B.S.Razbirin, L.S.Yudenchik, M.Brousseau, J.Collet, A.Cornet (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1479-83 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2610-17 (Sept. 1982). [received: April 1983]

The luminescence spectra of cadmium sulfide and selenide crystals were studied at low temperatures and high excitation intensities. The variation of the electron temperature in the picosecond range of excitation pulses was analyzed. The loss rate for the mean exciton kinetic energy in the selenide was measured. Kinetics studies yielded further support for the idea that the P line is biexcitonic. In order to analyze the spectral characteristics of excitonic and biexcitonic luminescence lines in the sulfide, some statistical properties of exciton and biexciton gases were examined. It is shown that under the experimental conditions used the exciton and biexciton temperatures are the same and do not fall below 6-8 K when $T_{\text{lat}}=2\text{K}$. (9 refs.)

62345 Exciton and soliton excitation in molecular chains. A.A.Eremko, A.I.Sergienko.

Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.338-42 (March 1983). In Russian. Deals with soliton excitations of molecular chains where dipole moments of a molecule transition into an excited state can be both parallel and perpendicular to the chain axes. If the exciton maximal group velocity is less than that of sound waves, the kinetic mass of a soliton can be less than that of a free exciton. The soliton limiting velocity in this case will be the maximal group velocity of excitons. (9 refs.)

62346 On the theory of soliton annihilation by excitons. A.A.Vakhnenko, Yu.B.Gaididei.

Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.342-8 (March 1983). In Russian. The processes of soliton annihilation by localized electronic excitations in molecular chains are investigated. Temperature and solitonization degree dependences of the annihilation rate are obtained, which indicates a possibility of observing solitons experimentally. (5 refs.)

71.36 POLARITONS

(inc. photon-phonon and photon-magnon interactions)

62347 The polariton in CdSe: measurement of time of flight and nonlinear transmission. P.Lavallard, Pham Hong Duong (Groupe de Phys. des Solides, Ecole Normale Supérieure, Paris, France).

Rev. Cethedec (France), vol.19, no.NS82-2, p.175-88 (1982). In French. Polariton time of flight has been measured in CdSe. The dispersion curve parameters are deduced from the experiment: $\Delta_{\text{LT}}=1\text{ meV}$; $m=0.45 m_0$. For a strong incident light intensity, the polariton transmission becomes nonlinear: the absorption increases to such a degree that a decrease of transmitted intensity is observed when one increases the incident intensity. A model taking into account the formation of scattering centers by the beam itself, explains quite well the observed phenomena. (7 refs.)

71.38 POLARONS AND ELECTRON-PHONON INTERACTIONS

(for electron-phonon interactions in lattices, see also 63.20K)

62348 Perturbation theory for continuum bound polaron state. S.Mukhopadhyay, T.K.Mitra (Dept. of Theoretical Phys., Indian Assoc. for Cultivation of Sci., Calcutta, India).

Phys. Lett. A (Netherlands), vol.94A, no.6-7, p.301-4 (21 March 1983). Perturbation of a continuum state of a Coulomb bound polaron is considered for the first time and it is shown that the Frohlich limit is obtainable only from this state and not from the ground state of the bound polaron as is commonly believed. (11 refs.)

62349 The electron-phonon interaction spectrum in beryllium. Yu.G.Naidyuk, O.I.Shklyarevskii (Physicotech. Inst. for Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1491-3 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2631-5 (Sept. 1982). [received: April 1983]

The method of microcontact spectroscopy is used to study spectra of electron-phonon interaction in beryllium. A detailed comparison of microcontact spectra with known dependences of the density of phonon states in this metal is performed. It is shown that microcontact spectra may be used for defining the phonon spectrum of beryllium more precisely. The integral parameter, λ , of the electron-phonon interaction is determined within the free-electron model. (21 refs.)

62350 Large deviation asymptotics and the polaron. M.D.Donsker, S.R.S.Varadhan (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA).

Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.111-18

Describes in outline form the latest extension of the large deviation theory and how in particular the resulting asymptotics provide a solution to the polaron problem. The detailed proofs can be found elsewhere. (5 refs.)

71.45 COLLECTIVE EFFECTS

62351 Velocity autocorrelation function of a 2D classical electron liquid. G.K.Agarwal, K.N.Pathak (Dept. of Phys., Panjab Univ., Chandigarh, India).

J. Phys. C (GB), vol.16, no.10, p.1887-92 (10 April 1983). Expressions for the first six frequency moments of the self-correlation function have been obtained appropriate for a 2D classical electron liquid interacting with a $1/r$ potential. The results of the moments and the Mori-Zwanzig formalism have been used to analyse the recent molecular dynamics data for the velocity autocorrelation function. It is found that a phenomenological form of the relaxation kernel with two relaxation times provides a good agreement with the molecular dynamics data. (13 refs.)

62352 Charge-density waves in a strong magnetic field. III. B.G.S.Doman (Dept. of Appl. Maths. & Theoretical Phys., Univ. of Liverpool, Liverpool, England).

J. Phys. C (GB), vol.16, no.11, p.2069-74 (20 April 1983). For pt.II see *ibid.*, vol.14, p.3393 (1981). The theory developed by Mertsching and Fischbeck (1981) to describe the incommensurate charge-density waves is

extended to examine the situation in the presence of a magnetic field. Phase diagrams are drawn for three different sizes of magnetic field. (9 refs.)

62353 Local nature of charge-density-wave conduction noise in niobium triselenide. N.P.Ong, G.Verma (Dept. of Phys., Univ. of Southern California, Los Angeles, CA, USA).

Phys. Rev. B (USA), vol.27, no.7, p.4495-8 (1 April 1983).

In four-probe samples the authors show that the charge-density-wave noise spectrum fundamental in each of the three segments oscillates independently. Amplitude studies also show that the conduction noise originates at the contacts rather than in the bulk. (11 refs.)

62354 Image forces and the range of stability of a two-dimensional Wigner crystal. B.Abdullaev, Yu.E.Lozovik (Inst. of Spectroscopy, Acad. of Sci., Troitsk, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1510-11 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2663-6 (Sept. 1982). [received: April 1983]

A generalized phenomenological Lindemann melting criterion, which states that the relative mean square displacement of two neighboring particles along the stability curve represents a constant fraction of the square of the lattice period, is used to study the effect of image forces and of a transverse magnetic field on the stability range of a two-dimensional electron crystal. The image forces cause cold melting at low electron densities (rather than at high densities, as predicted by theories neglecting the image forces). In a finite magnetic field $H \neq 0$, the electron gas crystallizes again in the low-density limit. The two ranges of existence of a crystal phase (two 'humps') merge on increase in H . The crystal phase is stable in a magnetic field even when the image forces destroy completely the crystal order at $H=0$. (7 refs.)

71.45G Exchange, correlation, dielectric and magnetic functions, plasmons

62355 Exchange, correlation, and band gaps in conjugated linear chains. J.M.Andre, J.L.Bredas, B.Themans (Lab. de Chimie Theorique Appliquee, Facultes Univ. Notre-Dame de la Paix, Namur, Belgium), L.Piela.

Int. J. Quantum Chem. (USA), vol.23, no.3, p.1065-72 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

In the case of conjugated polyenic chains (polyacetylene), the relationship between the long- (or short-) range nature of the restricted Hartree-Fock exchange interaction, the role of correlation effects, and the size of energy gaps are illustrated. (16 refs.)

62356 Electronic correlations and midgap absorption in polyacetylene. Z.G.Soo, L.R.Ducasse (Dept. of Chem., Princeton Univ., Princeton, NJ, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.4092-5 (15 March 1983).

Electronic correlations are important when they lift degeneracies of Huckel models. Standard Pariser-Parr-Pople (PPP) parameters split the degenerate midgap absorption of neutral solitons in undoped trans polyacetylene (CH)_x. The dipole intensity goes entirely to the upper state close to the optical gap E_g . PPP correlations lower slightly the nondegenerate transition at $E_g/2$ of charged solitons, which consequently provide all the $E \sim E_g/2$ intensity. Exact symmetries of correlated states and finite-chain computations are exploited in associating the midgap absorption of neat and lightly doped (CH)_x entirely with charged solitons. (25 refs.)

62357 $2p_F$ and $4p_F$ instabilities in the one-dimensional electron gas. J.E.Hirsch (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA), D.J.Scalapino.

Phys. Rev. Lett. (USA), vol.50, no.15, p.1168-71 (11 April 1983).

Charge- and spin-density response functions in the one-dimensional $1/d$ -filled extended Hubbard model have been studied by use of a Monte Carlo technique. The results show that Coulomb interactions suppress the $2p_F$ charge-density singularity, while they enhance the $2p_F$ spin-density singularity. The $4p_F$ response is only appreciable if, in addition to on-site repulsion, longer-range interactions exist. The present results are compared with weak-coupling renormalization-group predictions. (7 refs.)

62358 Second-order perturbation treatment of correlations in transition metal alloys. V.Drchal, J.Kudrnovsky (Inst. of Phys., Czechoslovakian Acad. of Sci., Prague, Czechoslovakia).

Phys. Status Solidi b (Germany), vol.116, no.1, p.119-28 (1 March 1983).

Correlation effects in disordered transition metal alloys are studied within the degenerated Hubbard model using the perturbation theory limited to the second order in U/w (U Coulomb integral w bandwidth). The influence of disorder is included within the coherent potential approximation. The theory is illustrated on a simple model of the copper-nickel alloy. (10 refs.)

62359 Linear response of a semi-infinite substrate with a two-dimensional conductive surface layer in the plasma-pole approximation. F.J.Crowne (US Army Electronics Res. & Dev. Command, Harry Diamond Labs., Adelphi, MD, USA).

Phys. Rev. B (USA), vol.27, no.6, p.3201-12 (15 March 1983).

The current-current linear-response function for a semi-infinite compressible electron-gas substrate with a surface layer of zero thickness is evaluated by treating the substrate hydrodynamically. No assumptions are made regarding the current-current response of the surface layer, and retardation effects are fully included. Contact is made with Nakayama's paper (1974) on surface plasmons, and a discussion of the effects of a finite compressibility of the background electron gas on the surface modes is included. Angular distributions for Raman scattering by a simple type of surface plasmon are calculated as an application of these results. (13 refs.)

71.50 LOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

(exc. impurities; for localisation in disordered structures, see 71.55J)

62360 Gauge transformation study of two-dimensional localisation in magnetic fields. H.Aoki (Cavendish Lab., Univ. of Cambridge, Cambridge, England).

J. Phys. C (GB), vol.16, no.10, p.1893-900 (10 April 1983).

The effect of gauge transformation on the two-dimensional system in a strong magnetic field is studied numerically to shed light on the localisation of states. The result for the gauge dependence of energy levels and wavefunctions for periodic boundary conditions shows that an extended eigenstate is sensitive to the gauge transformation while a localised eigenstate is essentially unchanged indicating an exponential localisation. (22 refs.)

62361 One-electron broken-symmetry approach to the core-hole spectra of semiconductors. A.Zunger (Solar Energy Res. Inst., Golden, CO, USA).

Phys. Rev. Lett. (USA), vol.50, no.16, p.1215-18 (18 April 1983).

It is shown that in contrast to band theory, a self-consistent one-electron model with broken symmetries (crystal orbitals are not constrained to be Bloch periodic) provides a physical description of core-ionization, core-exciton, and core-to-conduction-band transition energies in semiconductors. Application to GaP shows that a hitherto unrecognized factor—the screening of the core-hole self-energy by the electron orbit—can explain many of the outstanding puzzles in core hole spectra. (21 refs.)

Local modes: their relaxation, polarization, and stereoselective excitation by lasers See Entry 60691

71.55 IMPURITY AND DEFECT LEVELS

62362 Theory of the autoionized state of impurities in semiconductors. Gan Zizhao, Han Ruqi (Peking Univ., Peking, China).

Chin. J. Semicond. (China), vol.4, no.2, p.105-16 (March 1983). In Chinese.

A theory of the autoionized state of impurities in semiconductors is developed. It is analogous to the configuration interaction model for autoionized state of atoms. From this theory, the formal expression of the position, width and wave function of autoionized state of impurities is obtained, and an explanation of the autoionized level manifesting itself in continuous absorption spectra, as an asymmetric peak which is called Fano's line shape, is given. A concrete computing method for the autoionized state of impurities, known as the complex coordinate method is developed. As an example, the position and width of an autoionized state of acceptor in Si, which belongs to the Γ_7 symmetry, are computed. (29 refs.)

62363 Theoretical study on the nitrogen isoelectronic trap in GaAs_{1-x}P_x. Li Hanqiu, Lu Fen (Fudan Univ., Shanghai, China).

Chin. J. Semicond. (China), vol.4, no.2, p.187-90 (March 1983). In Chinese.

Using a cluster model, the EHT method is used to calculate the electronic binding energy of the N-isoelectronic trap in GaAs_{1-x}P_x. It is shown that in order to make some major improvements in the results, it is necessary to take the excited orbitals of atoms into consideration. (7 refs.)

62364 Carrier capture by multiphonon emission at extrinsic deep centers induced by self-trapping in GaAs. H.Goto, Y.Adachi, T.Ikoma (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan).

J. Appl. Phys. (USA), vol.54, no.4, p.1909-23 (April 1983).

The extent of electron-lattice coupling at neutral, extrinsic self-trapping-induced deep centers in III-V compound semiconductors is estimated by assuming a deformation potential interaction in the framework of a continuum lattice model, and its delocalization around these deep centers is pointed out. A model potential which takes into account the delocalization of the coupling is proposed and a theoretical expression is derived for capture cross sections at these centers by combining the model potential with multiphonon emission carrier capture scheme. The theory successfully explained both temperature dependence and the magnitude of capture cross sections observed at three electron traps (deep centers) in GaAs. Although the magnitude of capture cross sections at two of these three electron traps seem to deviate from the predicted by Henry and Lang, the multiphonon emission carrier capture scheme is still applicable to such deep states by employing the authors' model potential. (32 refs.)

62365 New aspects of the oxygen donor in gallium phosphide. P.J.Dean, M.S.Skolnick (RSRE, Great Malvern, England), Ch.Uihlein, D.C.Herbert.

J. Phys. C (GB), vol.16, no.11, p.2017-51 (20 April 1983).

Newly discovered or reconsidered experimental properties of the centre are presented. Particular emphasis is given to the properties of the second electron state, O_p^- . The authors show that occurrence, Zeeman effect, and hole electronic excited states of an absorption transition near 1.738 eV are consistent with the D^0, X BE for the centred O_p^0 donor, and deduce $E_g^* = 41.7$ meV, $E_g = 570$ meV. Complex behaviours of this D^0, X BE absorption in the PLE spectrum of distant DAP luminescence are fully explained. The exciton localisation energies of this BE are those of eight other donors in GaP, some nearly effective-mass-like, follow a single power-law dependence on E_g . Electron capture by O_p^- appears to proceed via 42 meV deep excited state of centred O_p^- , with a further excited state 37.5 meV below the conduction band. Zeeman splittings and shifts, lifetime and phonon coupling of this transition, with no-phonon line at 528 meV, and their relation to the D^0, X BE absorption and first electron capture luminescence are discussed. Evidence is presented that the absence of luminescence from the D^0, X BE and the broadening of the electronic transitions results from the short lifetime of the metastable centred O_p^- state before relaxation to the strongly distorted rebounded ground state. Zeeman properties of the D^0, X BE absorption, the distant discrete DAP no-phonon luminescence and the electron capture luminescence at O_p^- are all strikingly inconsistent with a recent reassignment of the single-electron state of O_p^- to 4T_1 rather than 2A_1 . An alternative interpretation is advanced for the strong temperature dependence of the optical cross section σ_{pl}^0 at low T , one of the main motivations for the reassignment. The Zeeman effect of the 0.841 eV capture luminescence is quantitatively consistent with a spin doublet to spin doublet transition, rather than the transition between spin quartet states of the alternative model. (54 refs.)

62366 Quantum mechanical state of interstitial hydrogen in metals: energy and wavefunctions. H.Sugimoto, Y.Fukai (Dept. of Phys., Chuo Univ., Tokyo, Japan).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.307 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

Summary form only given, as follows. The energy and wavefunctions of hydrogen (deuterium) atoms self-trapped on interstitial sites in FCC and BCC metals were calculated. The Schrodinger equation for a hydrogen (deuterium) atom is solved in the interaction potential field with the surrounding metal atoms approximated by the sum of central pair potentials. Both the ground and excited states were studied and compared with the observed inelastic neutron scattering spectra in the optic mode. These calculations show that a consistent understanding of many properties of the excited states of a hydrogen atom on the tetrahedral site in BCC vanadium, niobium and tantalum, on the octahedral site in body-centred tetragonal β -VH₂ and on the octahedral site in FCC palladium can be obtained. The calculated wavefunctions were also compared with Fourier-reconstructed density maps from neutron diffraction experiments. (1 ref.)

62367 Properties of some defect complexes of gold in silicon. H.Lemke (Zentralinst. fur Elektronenphys., Akad. der Wissenschaften, Germany). *Phys. Status Solidi a (Germany)*, vol.75, no.2, p.473-82 (16 Feb. 1983). In German.

The properties of some ion pairs between donors or double donors of the 3d-group and the acceptor gold are investigated by DLTS- and TSCA-techniques. The pair (Fe^+Au^-) is an acceptor at $E_c-0.34$ eV with $r_p^n=3\times 10^{-8}$ cm² s⁻¹ ($T=160$ K) and the pair (Cr^+Au^-) a donor at $E_v+0.35$ eV with $r_p^p=1\times 10^{-8}$ cm² s⁻¹ ($T=170$ K). The ion pair of Au with the double donor, Mn has two levels: an acceptor at $E_c-0.24$ eV with $r_p^n=4\times 10^{-8}$ cm² s⁻¹ ($T=120$ K) and a donor at $E_v+0.57$ eV with $r_p^p=3\times 10^{-8}$ cm² s⁻¹ ($T=250$ K). The pair levels for V lie at $E_c-0.20$ eV with $r_p^n=6\times 10^{-9}$ cm² s⁻¹ ($T=115$ K) and at $E_v+0.42$ eV with $r_p^p=8\times 10^{-9}$ cm² s⁻¹ ($T=200$ K). From the measurements of mass-action constants binding energies of 0.9 (Fe), 0.9 (Mn), 1.1 (Cr), and 1.6 eV (V) are determined. (15 refs.)

62368 Long-range part of the interaction between two hydrogen impurities in jellium. P.Perrot (CEA, Villeneuve-Saint-Georges, France), M.Rasolt. *Phys. Rev. B (USA)*, vol.27, no.6, p.3273-8 (15 March 1983).

The interaction of two hydrogen impurities in jellium is calculated in the 'overlapping densities' approximation where the total displaced charge is the sum of two frozen single ion screening densities. Using the fourth-order gradient expansion of the kinetic-energy functional, the authors obtain the results at various densities, corresponding to Al, Mg, and Na. The results provide an extension for the full treatment of the short-range proton-proton interaction to the asymptotic region where such exact calculation are as yet not available. (20 refs.)

62369 Energy of two-electron impurity states of tin in $\text{Pb}_{1-x}\text{Sn}_x\text{Se}$ solid solutions with low values of x . S.V.Zarubo, Yu.A.Nikulin, E.A.Gurieva, L.V.Prokof'eva, Yu.I.Ravich, M.N.Vinogradova, T.B.Zhukova (A.F. Ioffe Physicotechn. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1219-21 (Oct. 1982). Translation of: *Fiz. i Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1892-4 (Oct. 1982). [received: April 1983]

The authors have investigated the temperature dependence of the Hall effect in $\text{Pb}_{1-x}\text{Sn}_x\text{Se}$ solid solutions near $x=0$ as a function of the degree of doping with an acceptor impurity (Na) which made it possible to determine the depth of the localized Sn states and its temperature dependence. Lightly doped p-type samples with $x=0.02$ were prepared by allowing the composition to deviate from stoichiometry, whereas heavily doped samples were formed as a result of introduction of NaSe in amounts from 0.1 to 1.5 mol%. The authors used both polycrystalline and single-crystal samples. A study of the dependence of the Hall density on the Na content showed that in the range $N_{\text{Na}}\leq 0.3$ at.% every Na atom gave up one carrier and there was no increase in the carrier density on further increase in N_{Na} . The maximum density of holes in this solid solution was 4.0×10^{15} cm⁻³ at 4.2K. (5 refs.)

62370 Resonance level of tellurium associated with the L minima of the conduction band of gallium antimonide. A.S.Filipchenko, E.Litvin-Staszewska (A.F. Ioffe Physicotechn. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Semicond. (USA)*, vol.16, no.10, p.1229 (Oct. 1982). Translation of: *Fiz. i Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1906 (Oct. 1982). [received: April 1983]

The parameters of the L minima of the conduction band of gallium antimonide were determined using tellurium crystals under hydrostatic pressure conditions. The crystals used in these investigations had high concentrations of tellurium and, therefore, it was assumed that a resonance level of tellurium associated with the L minima of the conduction band was degenerate with these minima. The experimental dependencies of the relative change in the Hall coefficient with the applied hydrostatic pressure (in the saturation region of the dependence) can be used, with the aid of familiar formulas, to determine the ionization energy of resonance levels of tellurium associated with the L minima of the conduction band of gallium antimonide. The ionization energy of the tellurium levels associated with the L minima of the conduction is thus found to be ~ 10 meV. (3 refs.)

62371 Electron structure of edge dislocations in metals. M.I.Molotskii, V.S.Rostovtsev (Lenin Komsomol State Univ., Voronezh, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.9, p.1455-7 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2564-8 (Sept. 1982). [received: April 1983]

The electron structure of the core of an edge dislocation in copper is studied on the basis of a model which assumes the existence of dangling d bonds. The linear dislocation charge is calculated and the density of quasilocal d states is determined. The excess charge is found to be close to the charge near the axis of a screw dislocation. The density of the d states has a maximum near the Fermi level. Such a maximum leads to a resonant scattering of conduction electrons from dangling bonds, which may explain the high electrical resistivity associated with edge dislocations. (14 refs.)

62372 Electron transfer of hydrogen in aluminum at 20 and 800°C. O.M.Byalik, N.P.Volkotrub, V.M.Pinchuk, L.V.Golub, G.E.Detyarenko, D.F.Ivanchuk (Kiev Polytech. Inst., Kiev, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.3, p.221-4 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.34-8 (May-June 1982). [received: Feb. 1983]

The electron transfer of hydrogen was investigated in the field of the crystalline lattice of aluminum. The tests were made on a special unit with the use of the six-probe method of measuring specific electrical resistance. To reveal the mechanism of electron transfer of hydrogen in the field of the crystalline lattice of aluminum, a quantum-mechanical calculation of the interaction of the H^+ and H^- ion complexes with the aluminum atoms was made. (8 refs.)

62373 Steady state and transient capacitance measurements of the energy levels of a low angle tilt boundary in a germanium bicrystal. A.Broniatowski (CNRS, Villeneuve, France), J.C.Bourgoin.

Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.119-24

Steady state and transient capacitance (DLTS) measurements have been performed on a low angle tilt boundary in a germanium bicrystal, in combination with an electron microscope study of the boundary dislocation structure. A characteristic level has been found at 0.42 eV below the bottom of the conduction band, with a density about 10^{19} cm⁻² and an electronic capture cross-section about 5×10^{-12} cm². (15 refs.)

62374 Characterization of grain boundaries in polycrystalline GaAs. M.G.Spencer (Dept. of Electrical Engng., Howard Univ., Washington, DC, USA), W.J.Schaff, D.K.Wagner.

Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.125-9

Examination of capacitance transients arising from the emission or capture of electrons at a charged GaAs grain boundary reveal for the first time the existence of discrete interface levels. The position of these levels in the band-gap and their associated capture cross sections are determined from the transients. (6 refs.)

62375 Electronic states associated with grain boundaries in silicon. C.M.Shyu, L.J.Cheng (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).

Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.131-6

The density of states at the grain boundary is found to be a complicated function of both the defect state property and the physical location of the defect at the boundary. A modified double-depletion-layer model concerning the nonuniform distribution of defects along the boundary is presented. A method is developed which can estimate the level location from the complex DLTS spectra. (8 refs.)

62376 Grain boundary passivation in polycrystalline silicon: a DLTS study. P.C.Srivastava, J.C.Bourgoin (Groupe de Phys. des Solides, Univ. Paris VII, Paris, France).

Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.137-40

After treatment in a deuterium plasma, the DLTS spectrum associated with grain boundaries in p-type Si is found to reduce to a narrow band centered at 0.32 ± 0.02 eV with a total density of 5×10^{15} cm⁻². However, the capture cross-section, measured to be $\sim 2\times 10^{-20}$ cm², is 10 times larger than the apparent cross-section associated with the states present in unpassivated material. (10 refs.)

62377 Electronic structure of grain boundaries and interfaces in polycrystalline zinc oxide. M.H.Sukkar, H.L.Tuller, K.H.Johnson (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA).

Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.141-6

Preliminary theoretical models for the electronic structure of grain boundaries and interfaces in polycrystalline ZnO have been constructed on the basis of self-consistent-field X-alpha scattered-wave (SCF-X-alpha-SW) cluster molecular-orbital calculations. The disposition and character of the interface states, relative to the valence and conduction bands of the otherwise perfect crystalline material, have been studied for clusters representing coordinatively unsaturated Zn surface sites and molecular O₂ chemisorption thereon. The possible effects of the resulting interface states on electron transport at grain boundaries in ZnO varistors have been addressed. (16 refs.)

71.70C Crystal and ligand fields

- 62378 Application of the unitary group approach to crystal field theory. Wen Zhenyi (Dept. of Phys. Chem., Univ. of Copenhagen, Copenhagen, Denmark). *Int. J. Quantum Chem. (USA)*, vol.23, no.3, p.999-1009 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).
- An analytical treatment for a strong crystal field in an octahedral symmetry by using the unitary group approach is given. It shows that the convenience of the unitary group approach is comparable with that of the Racah method. (11 refs.)

- 62379 Effect of covalency on Slater parameters and the correction crystal field in transient-metal compounds. M.V.Eremin, A.A.Kornienko. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.45-8 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.79-85 (July 1982). [received: April 1983]

Simple formulas are obtained to calculate the influence of charge-transfer processes from ligand to metal on the parameters for two and three-particle operators, of a crystal field. As examples the compounds of manganese and nickel are considered. The calculated decreases of the Slater parameters due to the covalency of metal-fluorine binding is found to be ~2-8% and in order of magnitude agrees with experimental data. It is demonstrated that the second-rank correlation crystal field because of covalency may become very significant. (14 refs.)

- 62380 A microscopic interpretation of the spin-lattice coupling coefficients for S-state 4fⁿ ions. W.Pastusiak (Solid State Div., Inst. of Phys., A. Mickiewicz Univ., Poznan, Poland). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.63-70 (1 March 1983).
- A previously reported model for spin-lattice coupling for 4fⁿ electrons, based on the assumption that intraionic interactions are perturbed by relativistic interaction with crystal lattice, is developed. Analytical formula for second- and fourth-order spin-lattice coefficients are derived. Using these formula and the concepts of the relativistic crystal field in the point charge approach the values of the spin-lattice coefficients for Gd³⁺ in CaF₂ are calculated. These values are in much better agreement with the experimental values than those calculated so far. To the best of the authors knowledge the fourth-order spin-lattice coefficients are calculated the first time and their values are about ten times smaller than the experimental ones. (15 refs.)

- 62381 Crystal field splittings of PrX₃ compounds (X=Pt, Rh, Ir, Ru, Ni) studied by inelastic neutron scattering. F.J.A.M.Greidanus, L.J.De Jongh, W.J.Huiskamp (Kamerlingh Onnes Lab. Rijksuniv., Leiden, Netherlands), A.Furrer, K.H.J.Buschow. *Physica B & C (Netherlands)*, vol.115 B+C, no.2, p.137-55 (Jan. 1983).
- Neutron inelastic scattering experiments have been performed on polycrystalline samples of the cubic Laves phase compounds PrX₃ (X=Pt, Rh, Ir, Ni). Measurements in the paramagnetic state yield LLW parameters 0.6 < x < 1 and W < 0. In this region various levels cross at an x value 0.86 and as a consequence the electronic ground state in the paramagnetic regime is either the singlet Γ_1 , or the non-magnetic doublet Γ_3 . Measurements in the ferromagnetic state support these conclusions. The crystal-field parameters obtained can be used in model calculations of some macroscopic quantities, in particular the specific heat and the spontaneous magnetization. The variation of the x values in the present series of Laves phase compounds evidences the presence of a contribution by conduction electrons to the crystal field. (49 refs.)

- The Jahn-Teller problem of a system of an electronic doublet having spin-orbit splitting in first order and interacting with a doubly degenerate vibration is considered. A canonical transformation and variational approach is used to determine the ground vibronic Kramers' doublets. The variational wave functions are used to calculate the zero-field splitting and ESR g-values, which are compared with the experimental results on cobaltocene. (18 refs.)

- J. Magn. & Magn. Mater. (Netherlands)*, vol.36, no.1-2, p.208-12 (1 April 1983).

Results are reported for magnetization and neutron diffraction studies of the pseudobinary compounds PrAg_{1-x}Cu_x. As x is raised from zero to 0.25, the structure remains cubic CsCl-type and the bilinear exchange is nearly unchanged, whereas the effective quadrupolar coupling deduced from the detailed magnetization-field behavior above the antiferromagnetic Neel point (~10K) increases three-fold in magnitude. The x=0.5 compound, when cooled below ~150K, transforms from CsCl-type to an orthorhombic FeB₂-type structure. Detailed comparison of these structures shows that the instability of the CsCl-type may derive from the softening of zone-boundary phonons. Such phonons, via the dynamic Jahn-Teller mechanism would account for the quadrupolar interactions of negative (antiferro) sign which grow with increasing x. (12 refs.)

72.00 ELECTRONIC TRANSPORT IN CONDENSED MATTER

(for surfaces, interfaces, and thin films, see 73.)

72.10 THEORY OF ELECTRONIC TRANSPORT; SCATTERING MECHANISMS

62384 Quantized Hall effect in very strong magnetic field. Lai Wu-yan, Shen Jue-lian (Inst. of Phys., Acad. of Sinica, Beijing, China), Su Zhao-bin, Yu Lu.

Commun. Theor. Phys. (China), vol.2, no.1, p.929-33 (1983).
The experimentally observed quantized Hall plateau of $\rho_{xy} = 3h/e^2$ in a two-dimensional electron gas, when the lowest Landau level is $1/3$ filled, is discussed. The consistency of the extremal condition for the Hartree-Fock potential in the possible charge-density-wave state with an opening of the energy gap at the Fermi level is indicated. The exactness of such $1/3$ 'fractional' quantization might be justified by a modified version of Laughlin's argument (1981) based on gauge invariance. (14 refs.)

62385 Localisation and interaction in one dimension. W.Apel, T.M.Rice (Theoretische Phys., ETH-Honggerberg, Zurich, Switzerland).
J. Phys. C (GB), vol.16, no.10, p.L271-3 (10 April 1983).

As the temperature is lowered in a system of interacting fermions in one dimension with static impurities, the ratio of the elastic and inelastic scattering lengths depends crucially on the interaction coupling constants. In one range, transport in the system is classical and the resistance decreases with decreasing temperature. In the other range of coupling constants the transport has to be treated quantum mechanically and Anderson localisation results. (8 refs.)

62386 Eddy currents in media with anisotropic electrical conductivity. L.A.Bityutskaya, E.N.Bormontov, A.R.Regel', V.F.Synorov.

Sov. Tech. Phys. Lett. (USA), vol.8, no.7, p.377-9 (July 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.869-74 (July 1982). [received: April 1983]

The authors examine the general conditions required for the occurrence of eddy currents caused by an anisotropy of the electrical conductivity in an anisotropic medium. They study the nature of these closed currents in the regions for which the mathematical description is simplest. (5 refs.)

72.15 ELECTRONIC CONDUCTION IN METALS AND ALLOYS

72.15C Electrical and thermal conduction in amorphous and liquid metals and alloys

62387 Magnetoresistance investigation of amorphous $(\text{Fe}_{1-x}\text{Cr}_x)_{84}\text{B}_{16}$ alloys. Y.Z.Wang, F.M.Yang, Y.S.Wu, M.Y.Feng, W.S.Zhan (Inst. of Phys., Chinese Acad. of Sci., Beijing, China).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1473-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Systematic investigation of transverse and longitudinal magnetoresistance of amorphous $(\text{Fe}_{1-x}\text{Cr}_x)_{84}\text{B}_{16}$ alloys were performed. The measurement results show that the magnetoresistances of this system are dependent strongly on the Cr content. The low temperature resistance anomaly is suppressed obviously with increasing magnetic fields up to 70 kOe. These results can be interpreted in the light of magnetic origin. (5 refs.)

62388 Electrical resistivity and Hall effect of amorphous $\text{TM}_{77}\text{Si}_{10}\text{B}_{13}$ ($\text{TM} = \text{Fe, Co, Ni}$) alloys. T.K.Kim, C.O.Kim, Y.E.Ihm, B.W.Lau (Coll. of Engng., Chungnam Univ., Daejeon, Korea).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1477-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

To investigate the electronic transport phenomena of amorphous $(\text{Fe}_{1-x}\text{Ni}_x)_{77}\text{Si}_{10}\text{B}_{13}$ and $\text{Co}_{77}\text{Si}_{10}\text{B}_{13}$, the electrical and Hall resistivity were measured. The resistivity shows anomalous behaviour at Ni-rich composition. Ordinary Hall resistivity R_H , and spontaneous Hall conductivity γ_{HS} , decrease linearly with Ni content and R_H changes from positive to negative around $x=0.8$. Spontaneous Hall resistivity, R_s , decreases with Ni content and reaches zero around $x=0.8$. (4 refs.)

62389 Electrical resistivity and thermoelectric power of glassy $\text{Fe}_{74}\text{Co}_{10}\text{B}_{16}$ and $\text{Fe}_{67}\text{Co}_{18}\text{B}_{15}\text{Si}_1$ alloys. B.B.Prasad, A.K.Bhatnagar (School of Phys., Univ. of Hyderabad, Hyderabad, India).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1479-80 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Electrical resistivity and thermoelectric power measurements of $\text{Fe}_{74}\text{Co}_{10}\text{B}_{16}$ and $\text{Fe}_{67}\text{Co}_{18}\text{B}_{15}\text{Si}_1$ have been performed in the temperature range 77 to 900K. For both the samples the crystallization takes place in a two step process. Thermoelectric power $S(T)$ for both samples is found to be negative and at lower temperatures, a minima in $S(T)$ is observed which shows a Kondo type behaviour. (2 refs.)

62390 Electric resistance of Manganin to 2 GPa and 80K. S.Tamura (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).

High Temp.-High Pressures (GB), vol.14, no.3, p.307-10 (1982). (10th Plansee Seminar on 'Trends in Refractory Metals, Hardmetals, and Special Materials, and their Technology', Reutte, Austria, 1-5 June 1981).

The electric resistance of Manganin at high pressures (0-2 GPa) and low temperatures (80-250K) has been measured by using a piston-cylinder apparatus. 1-pentene is found to be an excellent pressure-transmitting medium in this temperature and pressure region. The pressure coefficient of resistance of Manganin decreases with decreasing temperature. (6 refs.)

62391 Contribution of solute aluminium in tungsten to the electrical resistivity. L.Uray, P.Tekula-Buxbaum (Res. Inst. for Tech. Phys., Hungarian Acad. of Sci., Budapest, Hungary).

J. Less-Common Met. (Switzerland), vol.90, no.1, p.89-94 (March 1983).

The contribution of aluminium dissolved in tungsten to the electrical resistivity was determined for various dilute WAl alloys prepared by diffusion alloying. The excess resistivity increased linearly with the aluminium concentration above a critical threshold concentration ($c_0 \approx 27$ wt.ppm), and so the contribution of the dissolved aluminium to the specific resistivity could be obtained from the slope of the plot of excess resistivity versus concentration. Since aluminium is volatile in tungsten, there is a radial evaporation profile in the thin wires used. The extrapolation to homogeneous solute distribution was carried out by means of an appropriate electrofinishing technique and stepwise resistance measurements. The contribution of aluminium to the specific resistivity of a homogeneous WAl alloy is $8 \pm 3 \mu\Omega \text{ cm}(\text{at.}\%)^{-1}$ at 77K. This value must be multiplied by 0.6 at 4.2K and by 1.4 at 300K. (8 refs.)

62392 The electrical conductivity of some silver, aluminium and cobalt alloys. Ch.J.Raub, W.Wopersnow (Forschungsinst. für Edelmetalle und Metallchem., Gmund, Germany).

J. Less-Common Met. (Switzerland), vol.90, no.1, p.153-9 (March 1983). In German.

Alloys of silver, aluminium and cobalt with titanium and zirconium show a negative temperature coefficient of electric resistance, depending on their composition and structure. This is especially pronounced at lower temperatures. Apparently the behaviour is connected with the occurrence of the β phase of titanium and zirconium or of other metastable phases in these alloys. (5 refs.)

62393 A study of the palladium-platinum-hydrogen system over a wide range of hydrogen pressures. B.Baranowski (Inst. of Phys. Chem., Polish Acad. of Sci., Warsaw, Poland), F.A.Lewis, W.D.McFall, S.Filipek, T.C. Witherspoon.

Proc. R. Soc. London Ser. A (GB), vol.386, no.1791, p.309-32 (8 April 1983).

Measurements with an extensive series of palladium-platinum alloys, of changes in electrical resistivity due to direct absorption of hydrogen from hydrogen gas at pressures up to 30 kbar (3GPa) have been made at 25 and 75°C. Interrelations at 25°C between hydrogen content, electrical resistivity and hydrogen pressures of up to ca. 20 bar have also been derived, for the more palladium-rich alloys, from measurements of electrode potentials. Finally the authors consider alterations of thermodynamic parameters with increasing platinum content, and decreasing hysteretic differences between relations derived during increases and decreases of hydrogen pressure. Particular comparisons are made with behaviour in the palladium-rhodium-hydrogen and palladium-nickel-hydrogen systems. (87 refs.)

62394 Temperature dependence of electrical resistivity of Al-Zn alloys. G.Vigier, J.Merlin (Groupe d'Etudes de Metall. Phys. et de Phys. des Materi-iaux, INSA de Lyon, Villeurbanne, France).

Philos. Mag. B (GB), vol.47, no.3, p.299-306 (March 1983).

The electrical resistivity of Al-4.4 and 5.3 at.% Zn alloys has been determined at various ageing temperatures, for various ageing times. It was found that within the limits of experimental accuracy the resistivity variations are not dependent on the measuring temperature. In particular the ageing time for the peak resistivity and the peak height are independent of the measuring temperature. These results cannot be explained by models which try to describe the resistivity variations by GP zone formation. (17 refs.)

62395 Electronic properties of bulk copper-aluminum and copper-zinc alloys. K.R.Mountfield, J.A.Rayne (Dept. of Phys., Carnegie-Mellon Univ., Pittsburgh, PA, USA).

Phys. Rev. B (USA), vol.27, no.6, p.3263-72 (15 March 1983).

Magnetic-susceptibility, as well as resistivity, Hall-effect, transverse-magnetoresistance, and thermoelectric-power measurements have been made on a series of well-characterized bulk samples covering the entire copper-aluminum and copper-zinc phase diagrams. In both systems the resistivity of the γ phase exhibits a sharp minimum as a function of composition. This minimum correlates with anomalies observed in the other measured properties and supports the hypothesis that the behaviour is due to electronic effects associated with overlap between the Fermi surface and the Jones zone for this structure. Comparison of the properties of other phases in the two systems indicates similarities which can be also ascribed to band-structure effects. (31 refs.)

62396 Electrophysical properties of nickel boride phases. M.D.Smolín, V.G.Grebenskina, Yu.M.Goryachev, L.I.Panov, E.I.Shvartsman (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.8, p.662-5 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.73-6 (Aug. 1982). [received: Feb. 1983]

The nickel boride phases were prepared by direct synthesis from 99.8% pure electrolytic nickel and 99.5% pure boron. Sintering was performed for 1.5 h in a vacuum at 0.9T_m. All specimens were found to have single-phase structures. The amount of conduction electrons was found to grow with the rise in nickel concentration in the boride phases. The Fermi energy shifted toward larger values, and the contribution of the two electron bands to conduction increased. With a rise in temperature, for the NiB phase the overlapping of the zones and the effective carrier mass decreased but for Ni₂B and Ni₃B the latter increased. (3 refs.)

72.15G Galvanomagnetic and other magnetotransport effects

62397 Longitudinal magnetoresistance of dilute alloys with localized magnetic moments in a quantizing magnetic field. I.G.Kuleev (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.2, p.213-24 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metall. (GB)*

A calculation is made of the longitudinal magnetoresistance of a conductor with a low concentration of magnetic impurities in a quantizing magnetic field. The calculation is made in the third order of perturbation theory in respect of the interaction between electrons and magnetic impurities. An analysis is made of the dependences of the smoothly varying and oscillatory parts of the longitudinal resistance on the temperature of a sample and on the magnetic field applied to it. It is shown that anomalous behaviour of the quantum oscillations associated with the Kondo effect is possible in the case of dilute solutions of the CuMn, AuMn, and AuFe type at low temperatures. (13 refs.) A.T.

62398 Magnetoresistance of Pd-Fe and Pd-Ni-Fe alloys. Y.Hsu, J.E.Schmidt, M.Gupta, S.Jen, J.L.Berger (Phys. Dept., Carnegie-Mellon Univ., Pittsburgh, PA, USA).

J. Appl. Phys. (USA), vol.54, no.4, p.1887-91 (April 1983).

The electrical resistivity of Pd-Fe alloys has been measured in magnetic fields parallel and perpendicular to the current, for a wide range of alloy compositions. The influence of atomic ordering on the magnetoresistance has been investigated. The ferromagnetic anisotropy of resistance $\Delta\rho/\rho_0$ reaches a maximum value of +9% in the ordered state between 30 and 35 at.% Fe, and +6% in the disordered state between 40 and 60 at.% Fe, at 4.2K. At 295K, $\Delta\rho/\rho_0$ never exceeds +1%. Similar measurements have been done on $(\text{Pd}_{50}\text{Ni}_{50})_{100-x}\text{Fe}_x$ for $x \leq 30$ at.% Fe. The maximum $\Delta\rho/\rho_0$ value of +7% is obtained for 10 at.% Fe at 4.2K. (26 refs.)

62399 $T^{1/2}$ dependence of resistivity and anomalous magnetoresistance in granular bismuth. Y.Koike, M.Okamura, T.Fukase (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1115-18 (April 1983).

In granular bismuth, electrical resistivity with $T^{1/2}$ dependence was observed in the low temperature range 0.5-4.2K, while anomalous positive magnetoresistance was found in this range. This anomalous magnetoresistance, which increases with decreasing temperature, is fairly well explained by the three-dimensional localization theory taking account of the effect of strong spin-orbit interaction. The spin-orbit scattering time τ_{so} is estimated as 4×10^{-13} sec, and the inelastic scattering time τ_i changes in proportion to $T^{-2.7}$. On the other hand, $T^{1/2}$ dependence of resistivity seems due to the interaction effect between electrons.

62400 Magnetic and galvanomagnetic properties of rare earth intermetallic compounds of $\text{RAg}_{1-x}\text{In}_x$ (R=Gd, Tb, and Dy). K.Yagasaki (Hiroshima Univ., Hiroshima, Japan).

J. Sci. Hiroshima Univ. A (Japan), vol.46, no.2, p.113-47 (Jan. 1983).

Magnetic, electric, and galvanomagnetic measurements have been performed on polycrystalline specimens of $\text{RAg}_{1-x}\text{In}_x$ (R=Gd, Tb, and Dy) with compositions of $0 \leq x \leq 0.5$. The compounds of the Tb and Dy systems are all antiferromagnetic. On the contrary, the indium rich compounds of the Gd system are ferromagnetic. The paramagnetic Curie temperature, however, behaves almost similarly for all the systems. The Hall effect and transverse magnetoresistance were measured at paramagnetic temperatures and they were discussed on the basis of the two-band model. The ratio of the mobility of s -electrons to that of d -holes is estimated from the ordinary Hall coefficient to be constant within the experimental temperature region. The extraordinary Hall coefficient can be explained very well by assuming the force acting on the carrier due to the magnetic moment is proportional to the Lorentz force. The transverse magnetoresistance depends on H^2 and is subdivided into the ordinary and the extraordinary effects. The concentrations of s -electrons and d -holes are estimated from both the ordinary coefficients of the Hall effect and magnetoresistance. The concentrations above estimate the electrical conductivity due to the s -electron band at only a few percent of the whole, and the magnetic properties of all these systems can be explained satisfactorily by the simple RKKY model. (36 refs.)

62401 High accuracy measurement of the Hall effect in magnetic materials with an AC lock-in technique. J.B.Sousa, J.M.Moreira (Centro di Fisica, Univ. do Porto, Porto, Portugal).

Port. Phys. (Portugal), vol.13, no.3-4, p.137-72 (1982).

A very sensitive AC method is described for measurement of the Hall effect in metals. It uses a high quality lock-in amplifier with the oscillator incorporated, an operational power supply, and a low noise step-up transformer to increase the signal level. Voltage resolutions down to 1 nV are currently achieved, enabling the Hall coefficient of most magnetic metals to be measured within 1 part in 10^4 . A summary on the general transport equations and the correct definitions regarding the Hall effect in magnetic systems is presented. High accuracy data are given on the temperature dependence of the Hall resistivity (ρ_H) in a single crystal of gadolinium, with the magnetic field in the basal plane. For the first time, experimental data have been obtained on the temperature derivative $d\rho_H/dT$. This coefficient reveals clearly the critical behaviour associated with the ferro-paramagnetic transition point in gadolinium. A preliminary analysis on the critical behaviour is given, with specific suggestions for further developments. (39 refs.)

72.15N Collective modes, e.g. in one-dimensional conductors

62403 Electrical conduction properties of $\text{Mg}_{0.82}[\text{Pt}(\text{C}_2\text{O}_4)_2]_2\text{L}_2\text{H}_2\text{O}$. M.Mizuno, A.E.Underhill (School of Phys. & Molecular Sci., Univ. Coll. of North Wales, Bangor, Wales), K.Carneiro.

J. Phys. C (GB), vol.16, no.11, p.2105-13 (20 April 1983).

A detailed electrical conduction study of the one-dimensional conductor $\text{Mg}_{0.82}[\text{Pt}(\text{C}_2\text{O}_4)_2]_2\text{L}_2\text{H}_2\text{O}$ over the temperature range 80-335K is described. An anomaly in the electrical conductivity has been observed to occur in the range 280-295K corresponding to a previously observed orthorhombic to monoclinic phase transition. The temperature dependence of the electrical conductivity is discussed in relation to the development of a superstructure, which is not of the usual Peierls type. The behaviour suggests that the compound is in a chaotic state as a result of competing incommensurate instabilities. (23 refs.)

62404 Shubnikov-de Haas oscillations in an organic conductor tetramethyltetraselenafulvalene-2,5-dimethyl-7,7', 8,8' tetracyanoquinodimethane (TMTSF-DMTCNQ). S.Bouffard (Section d'Etude des Solides Irradiés, CEN, Fontenay-aux-Roses, France), M.Ribault, D.Jerome, K.Bechgaard.

J. Phys. Lett. (France), vol.44, no.8, p.L285-93 (15 April 1983).

The observation of Shubnikov-de Haas (SdH) oscillations in the metallic, high pressure phase (Metal-II) of TMTSF-DMTCNQ ($P > 10$ kbar) demonstrates the 3-dimensional, closed nature of the Fermi surface at low temperature ($T < 2$ K). The authors observe very small Fermi surface cross-sections of $1.16 \times 10^{17} \text{ m}^{-2}$ and $2.6 \times 10^{17} \text{ m}^{-2}$ in the ab and ac planes respectively. From the field and temperature dependence of the SdH oscillations, the authors extract a cyclotron mass $m_c/m_0 \approx 0.56$ and a Dingle temperature $T_D = 0.8$ K. Finally they discuss the discrepancy between these results and the very high DC conductivity ($\sigma_{1,2K} \approx 3 \times 10^5 (\Omega \text{cm})^{-1}$). (28 refs.)

62405 Incommensurate-commensurate transition in TaS_3 . Z.Z.Wang, H.Salva, P.Monceau, M.Renard (Centre de Recherches sur les Tres Basses Températures, Grenoble, France), C.Roucau, R.Ayroles, F.Levy, L.Guemas, A.Meerschaut.

J. Phys. Lett. (France), vol.44, no.8, p.L311-19 (15 April 1983).

Careful electron diffraction measurements show that the Peierls distortion, which appears in TaS_3 with the orthorhombic structure at $T_0 = 215$ K, is weakly incommensurate with the underlying lattice. The periodicity of the distortion is temperature dependent and locks at $T_0 = 140$ K to a value equal to four times the lattice constant. This incommensurate-commensurate transition is observable in transport measurements and also in dynamical properties of the charge density wave. The authors explain this transition with a model where the charge density waves on two sets of chains are strongly coupled. (17 refs.)

62406 Temperature dependence of the electrical resistivity due to dislocations in metals. T.Endo (Hiroshima Denki Inst. of Technol., Hiroshima, Japan).

J. Sci. Hiroshima Univ. A (Japan), vol.46, no.2, p.195-216 (Jan. 1983).

The temperature dependence of the electrical resistivities due to dislocations $\rho_d(T)$ in Au-0.003 at.%Sn have been measured. As the temperature is raised, the dislocation resistivity $\rho_d(T)$ decreases gradually and increases rapidly, showing a resistivity minimum in $\rho_d(T)$. Two models for the rapid increase in $\rho_d(T)$ have been compared with the experimental results obtained by the present author and others. Furthermore, the resistivity minimum in $\rho_d(T)$ has been examined in detail for pure aluminum, a dilute aluminum-magnesium alloy and pure gold, and has been discussed by using the two-state tunneling model firstly developed for amorphous metals. In conclusion, an additional electron level localized around a dislocation plays an important role for the temperature dependence of the dislocation resistivity in metals. (33 refs.)

72.20 CONDUCTIVITY PHENOMENA IN SEMICONDUCTORS AND INSULATORS (for nonelectronic thermal conduction, see 66.70)

62407 Electrical resistivity of mixed-valence systems in a two-band model. H.V.Sharma, I.Singh (Dept. of Phys., Univ. of Roorkee, Roorkee, India).

J. Phys. C (GB), vol.16, no.10, p.L279-83 (10 April 1983).
The authors study here the variation of electrical resistivity with temperature of mixed-valence systems using a two-band model. They find various types of

behaviour (e.g. metallic and semiconducting) for a different set of parameters in the theory. Results are compared with recent experimental findings on various mixed-valence systems, e.g. SmS , SmB_6 , CePd_3 . (15 refs.)

72.20D General theory, scattering mechanisms

62408 Mechanism of electrical conduction in rare-earth ferrocyanides. K.Tennakone (Ruhuna Univ. Coll., Matara, Sri Lanka).

J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.3343-4 (15 March 1983).

The author observed that the semiconduction in ferrocyanides depends on the presence of water molecules in the lattice. The rare earth ferrocyanides generally contain variable amounts of water of crystallization, depending on the degree of drying. The values of electron activation energies are independent of the impurity concentration of the water molecules. However, the values of ρ_0 are dependent upon the water content and the data presented corresponds to a water impurity concentration of approximately one molecule per 200 molecules of the compound. The ferrocyanides examined could contain a maximum of five molecules of bound water of crystallization. Rare earth ferrocyanides do not show any ionic conduction until the concentration of water is largely in excess of the above maximum of bound water molecules. Thermoelectric tests show that in all cases, the charge carriers are predominantly electrons. The author gives a simple theory that explains how water molecules as an impurity could excite electronic semiconduction in ferrocyanides. (8 refs.)

62409 The electronic properties of semiconductor grain boundaries. C.H.Scager (Sandia Nat. Labs., Albuquerque, NM, USA).

Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.85-98

Grain boundaries play an important role in determining the operating characteristics of devices such as varistors and thin film solar cells and transistors. In the last several years detailed one-electron expressions have been developed for the transport coefficients of majority and minority carriers at grain boundaries. These theories have been successful in predicting the measured electrical properties of bicrystals in lightly doped silicon. The status of our understanding in this area will be reviewed in some detail. Recent extensions of these calculations which have been necessary to explain measurements on grain boundaries in degenerately doped GaAs will also be reviewed. (34 refs.)

62410 Analysis of disorder scattering in $\text{Ga}_{0.47}\text{In}_{0.53}\text{As}$ using Gaussian potential. K.Hiramatsu (Dept. of Electrical Engng. & Electronics, Nagoya Univ., Nagoya, Japan), T.Nishinaga.

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.504-7 (March 1983).

Disorder scattering mobility in $\text{Ga}_{0.47}\text{In}_{0.53}\text{As}$ is calculated by using a sum of two Gaussian potentials; one representing the difference of strong short range core potentials and the other representing the relatively long range potential, the existence of which has been suggested by the authors previously. Approximate calculations are made and a much steeper temperature dependency than the Brooks' disorder scattering mobility is predicted giving good agreement with the recent mobility measurements. (11 refs.)

62411 Transport phenomena in $\text{TlIn}_{1-x}\text{Sb}_x$ solid solutions. E.M.Godzhayev, Sh.M.Guseinova, A.B.Nagiev, F.M.Godzhayeva, T.N.Bakhshajiev (M. Azizebekov Inst. of Petroleum & Chem., USSR).

Inorg. Mater. (USA), vol.18, no.5, p.636-7 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.752-3 (May 1982).

[received: Feb. 1983]

It has been established, during a study of the temperature dependencies of the electrical conductivity and the Hall coefficient over a wide range of temperatures from 300 to 1100K, that a wide solubility region on the basis of TlInSe_2 (70 to 100 mole % TlInSe_2) is observed in the TlInSe_2 - TlInSb_2 system. The width of the forbidden zone of the solid solutions decreases as the amount of neodymium is increased in a linear manner. (4 refs.)

62412 Preparation and study of the electrophysical properties of the copper chalcogenides and their solid solutions. K.Dovletov, S.N.Krzhevitskaya, N.K.Samakhotina, K.Tashliev, Kh.Erniyazov (Physicotech. Inst., Acad. of Sci., Turkmen SSR).

Inorg. Mater. (USA), vol.18, no.5, p.638-41 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.745-8 (May 1982).

[received: Feb. 1983]

In studies of the electrical and thermoelectric properties of solid solutions in the systems $\text{Cu}_2\text{BVI-IVBVI}$ over a wide range of temperatures and concentrations it has been established that germanium and tin tellurides reduce the number of defects in Cu_2Te and the charge carrier concentration. The polymorphic transformations characteristic of copper chalcogenides are less clearly defined in the solid solutions with germanium and tin chalcogenides. (4 refs.)

62413 Resistance changes of $\text{Pb}_{0.8}\text{Sn}_{0.2}\text{Te}$ under dynamic loading in the 0-100 kbar range. Z.Rosenberg (ADA, Haifa, Israel), J.Genossar.

J. Phys. D (GB), vol.16, no.4, p.661-7 (14 April 1983).

Resistance changes of thin $\text{Pb}_{0.8}\text{Sn}_{0.2}\text{Te}$ films under dynamic pressures were measured using the planar impact configuration. The resulting resistance versus pressure curve, in the 0-100 kbar range, resembles similar static curves which were obtained for PbTe and $\text{Pb}_{1-x}\text{Sn}_x\text{Te}$ alloys. The pressure at the jump in resistance (48 kbar) which the authors obtained is very close to the phase transition pressure this compound is thought to have. Data from the release branch of the stress pulse are used, from which one can estimate the pressure hysteresis in the jump of the resistance curve. (11 refs.)

62414 Anomalous transient-time dispersion in amorphous solids: oxadiazole. N.Crisa (Dipartimento di Fisica, Univ. di Milano, Milano, Italy).

Phys. Status Solidi b (Germany), vol.116, no.1, p.269-74 (1 March 1983).

Hole transport in thin films of an organic disordered solid (oxadiazole) is studied by time-of-flight techniques as a function of sample thickness and applied field. The experimental data are analyzed in terms of the theory of stochastic non-Gaussian transport by Scher and Montroll (1975) showing the validity of this model. The last section is devoted to an evaluation of the hole drift mobility; its resulting values are extremely low ($<10^{-6} \text{ cm}^2/\text{Vs}$). (13 refs.)

62415 Dielectric properties and polaronic conductivity of WO_3 and $\text{W}_2\text{Mo}_{1-x}\text{O}_3$. R.Gehlig, E.Salje (Inst. fur Kristallographie und Petrographie, Univ. Hannover, Hannover, Germany).

Philos. Mag. B (GB), vol.47, no.3, p.229-45 (March 1983).

An investigation of the Debye relaxations in WO_3 and $\text{W}_2\text{Mo}_{1-x}\text{O}_3$ confirm the mechanism of polaronic conduction at low temperatures. The Mo positions act as trapping centres, and the relaxation times and activation energies

depend largely on the crystallinity of the samples. Polarons are spin-paired in the ground state (bipolarons), and can be separated by optical irradiation giving rise to 'inner' photoconductivity. The transport mechanism of the bipolarons is found to take place in three steps: dissociation into two single polarons, their transport and subsequent recombination. This model is energetically favoured over the transport of the bipolarons as a whole. (24 refs.)

62416 Semiconducting properties of V_2O_5 gels. C.Sanchez, F.Babonneau, R.Morineau, J.Livage (Spectrochimie du Solide, Univ. Pierre et Marie Curie, Paris, France), J.Bulot.

Philos. Mag. B (GB), vol.47, no.3, p.279-90 (March 1983).

Mixed-valence vanadium pentoxide gels have been obtained by polymerization of vanadic acid. They exhibit semiconducting properties which arise from electron hopping between V^{IV} and V^{V} ions. Such gels can easily be deposited onto a substrate, giving layers of high electrical conductivity ($\sigma=0.1 \Omega^{-1} \text{ cm}^{-1}$ at 300K). Their electrical properties can be described by the small-polaron model, and the main parameters have been determined by conductivity measurements, ESR and optical spectroscopy. The optical and thermal activation energies are found to be $E_{\text{opt}}=0.87 \text{ eV}$ and $E_{\text{th}}=0.17 \text{ eV}$. The transfer integral $J=0.05 \text{ eV}$ is quite small, and the electron-phonon coupling parameter $\gamma=14$ is rather high. The structural disorder of this amorphous semiconductor was estimated from electrical and ESR experiments. It leads to a localization of the charge carriers. (34 refs.)

62417 On the degree of dispersion to be expected for the mechanism of carrier hopping in spatially disordered systems. J.M.Marshall (Dept. of Phys., Dundee Coll. of Technol., Dundee, Scotland).

Philos. Mag. B (GB), vol.47, no.3, p.323-30 (March 1983).

Adler and Silver (1982) have recently presented the results of a Monte Carlo simulation study of transport by hopping between sites in a random spatial array. As a consequence of their modified simulation procedures, these authors obtain a higher degree of dispersion than that previously reported by Marshall (1978). On the basis of their data, Adler and Silver argue that the 'r-hopping' mechanism is capable of providing the highly dispersive transit pulses observed in time-of-flight studies of carrier mobility. The origins of the differing degrees of dispersion found in the two studies are re-examined. It is argued that Adler and Silver's technique, in which a composite transit pulse is produced by combining data obtained for a high degree of dispersion. This assertion is supported by the fact that Adler and Silver's study is performed for an array of such site density that anomalous dispersion would not be expected on theoretical grounds. On the basis of these simulation studies, it is argued that the highly dispersive transit pulses observed in many studies of carrier transport are not consistent with hopping in the presence of spatial disorder alone. (5 refs.)

62418 Study of the structure and elastoresistance properties of thin films of bismuth. C.Butto, J.Berty (Lab. de Microscopie et Structure des Matériaux, Univ. Paul Sabatier, Toulouse, France).

Thin Solid Films (Switzerland), vol.101, no.4, p.357-68 (25 March 1983).

The authors studied the influence of different conditions of preparation on the structure and elastoresistance properties of bismuth thin films. Bismuth films grow mainly with a [0001] fibre axis texture but in some cases randomly oriented bismuth grains were observed. A suitable thermal treatment appreciably improves the gauge coefficient of thin films. The condensation rate has no marked influence on the structure and elastoresistance properties of the deposits. (14 refs.)

62419 Influence of high pressure and shear strains on some electrophysical properties of polyphthalocyanines. V.A.Zhorin, S.I.Beshenko, L.I.Makarova, A.I.Sherie, Yu.A.Berlin, N.S.Enikolopyan.

Vysokomol. Soedin. Ser. A (USSR), vol.25, no.3, p.551-7 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

The influence of high pressure and shear strain on conductivity G and capacitance C of nonmetallic polyphthalocyanines, PPC with macromolecules of different length, ordering and degree of crosslinking has been studied. Both G and C of polymers under study were found to increase with their compression. The analogous phenomenon is observed at the simultaneous action of high pressure and shear strain. In the last case the change of G requires the lesser pressure, than at the single compression. The spectral studies show that the effect of pressure and strain of loaded samples on their electrophysical properties does not depend on the chemical structure of PPC, but is a result of the change of the average distance between regions of continuous conjugation. The dimensions of these regions can be increased by preliminary thermal treatment of PPC. (13 refs.)

- 62420 Direct observation of impact ionisation and hot electron effects in GaAs. T.Ohyama (Dept. of Phys., College of General Education, Osaka Univ., Toyonaka, Osaka, Japan). *Jpn. J. Appl. Phys. Part 2 (Japan)*, vol.22, no.3, p.1188-90 (March 1983). Measurements of the far-infrared cyclotron resonance of conduction electrons and the Zeeman absorption of donors in optically excited GaAs have been carried out in the presence of an electric field. The electric field dependence of the resonance intensity as well as the line shape can be explained in terms of the hot electron distribution and impact ionisation of the donor electrons. Furthermore, the polaron pinning effect accounts for the nonparabolicity of the conduction band.
- 62421 Diagonal and off-diagonal contributions to autocorrelation of velocity fluctuations in semiconductors. R.Brunetti, C.Jacoboni (Gruppo Nazionale di Struttura della Materia, Istituto di Fisica, Univ. Modena, Modena, Italy). *Phys. Rev. Lett. (USA)*, vol.50, no.15, p.1164-7 (11 April 1983). A theoretical analysis of velocity fluctuations in semiconductors is presented, and results obtained from a Monte Carlo procedure are shown for Si. It has been found in particular that (i) off-diagonal contributions to the velocity autocorrelation function must be taken into account; (ii) the convective contribution is positive; and (iii) a long tail in the autocorrelation function, due to intervalley fluctuations, may be present. (17 refs.)

72.20J Charge carriers: generation, recombination, lifetime, and trapping

- 62423 Simple method of calculating phonon-assisted Auger recombination rate in direct-gap semiconductors. M.Takeshima (Semiconductor Lab., Matsushita Electronics Corp., Osaka, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.3, p.491-8 (March 1983). A simple but approximate method is developed for calculating the phonon-assisted Auger recombination rate in direct-gap semiconductors, whose analysis is rigorously based on the Green's function formalism. The method is especially useful for analyzing loss mechanisms in a semiconductor laser which is made of a nondoped or a moderately doped layer. The usefulness of the method is demonstrated through the rigorous and the approximate calculations for typical materials GaAs, InP, GaSb and InAs. The condition, under which the early theory based on the second-order perturbation treatment is useful, shows up through a characteristic function. A brief discussion is also given of experiments.
- 62424 Trapping center parameters in indium selenide single crystals by thermally stimulated current measurements. G.Micocci, A.Rizzo, A.Tepore (Dipartimento di Fisica, Univ. di Lecce, Lecce, Italy). *J. Appl. Phys. (USA)*, vol.54, no.4, p.1924-9 (April 1983). Systematic investigations of trapping center parameters have been carried out on InSe single crystals grown from nonstoichiometric melt, by using a thermally stimulated current (TSC) technique. TSC measurements have been performed between 50 and 300K, and the results have been analyzed according to different methods. The trap characteristics have been determined. In particular, two levels located at 60 and 160 meV below the conduction band have been investigated in detail. Their capture cross sections have been found to be 1.5×10^{-23} and 9.2×10^{-21} cm^2 , respectively, and their concentrations are 1.9×10^{17} and 2.3×10^{16} cm^{-3} , respectively. It is concluded that in these centers retrapping is negligible. One additional level has been found at 340 meV with concentration $N_T = 4.2 \times 10^{16}$ cm^{-3} and capture cross section $\sigma = 3.5 \times 10^{-19}$ cm^2 . (21 refs.)

- 62425 Impurity scattering time in n-type InSb measured by Faraday rotation at far-infrared frequency. D.M.Zengin (Dept. of Phys., Bedford Coll., Univ. of London, London, England). *J. Phys. D (GB)*, vol.16, no.4, p.653-60 (14 April 1983). Low-temperature electron-impurity scattering times have been measured in n-type InSb samples with different electron densities from Faraday rotation by using a pulsed 0.337 mm HCN laser. The electron-impurity scattering times obtained from the experimental results using a curve-fitting method yielded values of 3 to 4×10^{-12} s at liquid helium temperatures for three different samples. These scattering times were in sharp contrast to the field dependent DC scattering times calculated from DC mobility measurements at 4.2K in zero magnetic field. However, there was good agreement between the impurity scattering times observed from the Faraday rotation measurements and those derived from the cyclotron resonance linewidth measurements at 4.2K. Possible explanations of the experimental results were also considered. (22 refs.)

- 62426 Influence of charging of local centers on the electrical properties of inhomogeneous CdS photoconducting structures. E.F.Afon'ko, A.S.Tonkoshkur (Ukraine & Russia Reunion Tercentenary State Univ., Dnepropetrovsk, USSR). *Sov. Phys.-Semicond. (USA)*, vol.16, no.10, p.1224-5 (Oct. 1982). Translation of: *Fiz. i Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1899-901 (Oct. 1982). [received: April 1983]
- The processes of charging of local centers in the vicinity of macroscopic potential barriers are responsible for such properties of inhomogeneous semiconductors as a hysteresis of the current-voltage characteristics, residual conductivity, low-frequency dielectric dispersion, considerable discharge and thermally stimulated depolarization currents, data on which are needed in the development of memory devices. The authors analyze these phenomena and propose a method for determining the parameters of traps participating in these phenomena in array-type inhomogeneous photoconducting structures each representing a dispersion of fine particles of photosensitive CdS in a silicon insulator. (8 refs.)
- 62427 Centres of slow recombination in cadmium bromide crystals. V.D.Bondar'v, A.B.Lyskovich, S.B.Kharambura. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.3, p.427-9 (March 1983). In Russian. The influence of X-ray irradiation on sensitivity was studied for CdBr_2 crystals. It is shown that slow recombination centres are formed in the process of CdBr_2 irradiation. These centres cause X-ray sensitivity of the crystals at low temperatures. (8 refs.)
- 62428 Transport across silicon grain boundaries. J.Werner, W.Jantsch, K.H.Froehner, H.J.QUEISSER (Max-Planck-Inst. fur Festkörperforschung, Stuttgart, Germany). Grain Boundaries in Semiconductors: Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.99-104. By comparison of the capacitance and the conductivity of p-type Si bicrystals, the authors show quantitatively that current transport occurs through thermionic emission of holes across the potential barrier, which is caused by charged donors in the grain boundary. Starting from this finding, they propose a simple model which allows for the first time a spectroscopic determination of the grain boundary density of states from photocapacitance data. Results indicate the presence of band tails and additional mid-gap states. (11 refs.)
- 62429 Electrical and structural properties of grain boundary in polycrystalline Si. R.T.Young, J.Narayan, Y.K.Chang (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA). Grain Boundaries in Semiconductors: Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.111-17. A special type of high angle grain boundary with mirror symmetry of the crystallographic orientation between the two grains is examined electrically and structurally. Transmission electron microscopy investigations show the nonuniform nature of the grain boundary. Both coherent and incoherent regions are observed along the boundary plane, and the types of dislocations and their densities vary from place to place. Electrical measurements of the boundary properties indicate no measurable barrier height. Heat treatment of the sample in an oxygen atmosphere at 950°C for 30 min did not change the boundary resistance. However, recombination effects are enhanced after boron diffusion. When pulsed laser radiation was used to process this material, it was found that the grain boundary structures were modified by laser-induced surface melting, i.e. incoherent boundaries were converted to coherent boundaries in the melted region. 72.20M Galvanomagnetic and other magnetotransport effects

- 62430 Negative magnetoresistance in semiconductors in the hopping conduction region. B.L.A.Ishluer, A.G.Aronov, D.E.Khmel'nitskii (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., Moscow, USSR). *JETP Lett. (USA)*, vol.36, no.5, p.195-8 (5 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. i Teor. Fiz. (USSR)*, vol.36, no.5, p.157-60 (5 Sept. 1982). [received: April 1983]
- It is shown that negative magnetoresistance in the hopping conduction regime with variable hopping length can be explained by including the displacement of the metal-insulator transition point in an external magnetic field. This explanation can be verified by studying the dependence of the magnitude of the magnetoresistance on the angle between the field and the crystal axes in strongly anisotropic conductors such as deformed Ge and Si. (12 refs.)

62431 Magnetoresistance and magnetization in $\text{Fe}_{80-x}\text{Ti}_{20}$ metallic glasses. R.Kern, M.Naka, U.Gonser, H.Fujimori, I.Okamoto (Fachbereich Angewandte Phys., Univ. des Saarlandes, Saarbrücken, Germany). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1471-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The decrease of the magnetoresistance anisotropy $\Delta\rho/\rho = (\rho_{\parallel} - \rho_{\perp})/\rho$ against T for $\text{Fe}_{80-x}\text{Ti}_{20}$ glasses is more pronounced when T is substituted by nonmagnetic Ti, V, Cr and Mn than in the case of Co and Ni. These T -dependencies can be described by the relation $\Delta\rho/\rho = A m_i^m$ where A and m are temperature dependent parameters. $\text{Fe}_{20-x}\text{Co}_{20}$ alloys are exceptional. (5 refs.)

62432 Ground state of two-dimensional electrons in strong magnetic fields and $1/3$ quantized Hall effect. D.Yoshioka (Bell Labs., Murray Hill, NJ, USA), B.I.Halperin, P.A.Lee.

Phys. Rev. Lett. (USA), vol.50, no.16, p.1219-22 (18 April 1983). The authors have diagonalized numerically the Hamiltonian of a two-dimensional system of up to six interacting electrons, in the lowest Landau level, in a rectangular box with 'periodic' boundary conditions. They find that the ground state has a pair correlation function quite different from that of a Wigner crystal, and its energy is significantly lower. They also find some indications of a downward cusp in the energy at $1/3$ filling. (14 refs.)

62433 Magnetoresistance and conductivity in the binary system titanium-oxygen. II. Semiconductive titanium oxides. H.Gruber, E.Krautz (Inst. fur Festkörperphys., Tech. Univ. Graz, Graz, Austria).

Phys. Status Solidi a (Germany), vol.75, no.2, p.511-18 (16 Feb. 1983). For pt.1 see *ibid.*, vol.69, p.287 (1982). In continuation of the investigations of the electrical and thermal conductivity as well as the magnetoresistance in the binary system titanium-oxygen for TiO_x with metallic conductivity for $x < 1.49$ the corresponding properties for the semiconductive compounds with $1.49 < x < 2$ are measured at low temperatures and magnetic inductions up to 15 T, especially the corundum phase Ti_2O_3 , the Magneli phase Ti_4O_7 and the reduce rutile phase TiO_{2-x} in dependence on oxygen content and temperature. (28 refs.)

62434 'Limiting' electrical properties of irradiated InP. V.N.Brudnyi, V.A.Novikov (V.D. Kuznetsov Physicotech. Sci.-Res. Inst., State Univ., Tomsk, USSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1211-12 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1880-2 (Oct. 1982). [received: April 1983]

Investigations of radiation defects in InP and in solid solutions based on this compound are of considerable practical and scientific importance. The results report the results of a preliminary investigation of the electrical properties, particularly the 'limiting' properties of InP crystals irradiated with $E = 2.2-2.3$ MeV electrons at 300K in doses D from 5×10^{14} to 1×10^{19} cm $^{-2}$. Some of the authors samples had n -type conduction with $n_0 \approx 4 \times 10^{17}$ cm $^{-3}$ as these were grown by the Czochralski method. Samples of p -type InP with $p_0 = 1.5 \times 10^{16}$ and $p_0 \approx 1.4 \times 10^{17}$ cm $^{-3}$ were prepared by the diffusion of zinc into the originally n -type material at $\sim 850^\circ\text{C}$ under an excess phosphorus vapor pressure of $\sim 2.026 \times 10^5$ Pa. Semiinsulating InP ($R_H \approx 1 \times 10^7$ cm 2 A $^{-1}$.sec $^{-1}$) was obtained as a result of diffusion of copper into originally n -type InP crystals; the diffusion took place at 950°C under a phosphorus vapor pressure of $\sim 2.026 \times 10^5$ Pa. (4 refs.)

62435 Characteristics of the magnetoresistance and photothermoelectric effect in single-crystal $\text{Cd}_{1-x}\text{Hg}_x\text{Te}$ plates subjected to quantizing magnetic fields. D.A.Kichigin, I.M.Rarenko, E.B.Tal'yanskii, D.D.Khalameida (Sci.-Res. Inst. of Radiophys. & Electronics, Acad. of Sci., Kharkov, Ukrainian SSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1212-13 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1882-4 (Oct. 1982). [received: April 1983]

Surface phenomena in thin semiconductor layers and plates are of considerable interest because such phenomena become more important on reduction in the thickness of a sample and, in some cases, particularly in inversion layers, they give rise to certain features typical of two-dimensional systems. The authors investigated the magnetoresistance and photothermoelectric effect in single-crystal $\text{Cd}_{1-x}\text{Hg}_x\text{Te}$ plates of different compositions ($0.135 \leq x \leq 0.185$) subjected to quantizing magnetic fields. The galvanomagnetic measurements were carried out by the usual method. The photothermoelectric effect was investigated during exposure of a sample to millimeter-wave radiation. In both cases the useful signal was selected by phase detection. (6 refs.)

62436 Semiconductor-type temperature dependence of the resistivity of $\text{Bi}_{1-x}\text{Sb}_x$ ($0.07 \leq x \leq 0.22$) alloy filaments. V.A.Dolma, F.M.Muntyanu (Inst. of Appl. Phys., Acad. of Sci., Kishinev, Moldavian SSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1233-4 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1911-13 (Oct. 1982). [received: April 1983]

The existence of a range of concentrations with a narrow band gap ($0 \leq E_g \leq 25$ meV) exhibited by BiSb alloys as well as the unusual dependence of the energy spectrum of carriers on the composition provide unique opportunities for experimental investigations of several electronic phenomena (such as electronic phase transitions, etc.) which appear under the influence of external agencies. The authors investigate the transport phenomena in filamentary crystals of BiSb alloys characterized by a high degree of perfection. The absence of semiconducting properties in the case of these alloys would prevent their potential use in some branches of microelectronics. The authors investigated the resistivity of thin ($0.3 \leq d \leq 40$ μ) filaments of $\text{P}_{1-x}\text{Sb}_x$ ($0.07 \leq x \leq 0.22$) alloys in a wide range of temperatures (4.2-300K) when subjected to static magnetic fields up to 15 T. 72.20N Thermomagnetic effects

62437 Thermomagnetic and magnetothermoelectric quality factor of $n\text{-Ag}_2\text{Te}$. S.A.Aliev, D.Sh.Abdinov, E.F.Agaev, D.G.Arasly (Inst. of Phys., Acad. of Sci., Azerbaizhdan SSR).

Inorg. Mater. (USA), vol.18, no.6, p.880-1 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1044-5 (June 1982). [received: Feb. 1983]

The level of interest in thermomagnetic (TM) and magnetothermoelectric (MT) transducers has increased greatly in recent years. The basic quality characterizing such transducers is the quality factor. Large values of the quality factors z_{TM} and z_{MT} can be expected in thermoelectric materials in which large longitudinal and transverse thermomagnetic effects are observed. Silver telluride is among the narrow-band semiconductors with a high mobility of electrons and a low lattice thermal conductivity. Therefore, it was of interest to determine the values of z_{TM} and z_{MT} in this material and to define the region of its practical application. On two specimens of Ag_2Te with $n = 1.5 \times 10^{18}$ and 3.1×10^{18} cm $^{-3}$, the authors carried out a joint investigation of the kinetic coefficients of thermal conductivity, thermal EMF, resistance, and Nernst-Ettingshausen effect in magnetic fields as great as 1.6 T. Experimental data are shown on the temperature dependence of κ , α , and ρ with $B = 0$ and $B = 1.6$ T and in a dimensionless N-E field $e_0 = QB^{-1}/\kappa e^{-1}$ with $B = 1.6$ T. On the basis of these data, the authors calculated the quality factors z_{TM} and z_{MT} . (7 refs.)

Characteristics of the magnetoresistance and photothermoelectric effect in single-crystal $\text{Cd}_{1-x}\text{Hg}_x\text{Te}$ plates subjected to quantizing magnetic fields See Entry 62435

72.20P Thermoelectric effects

62438 Thermoelectric properties of GeTe at high hydrostatic pressure up to 8.5 GPa and its valence-band structure. L.G.Khvostantsev, V.A.Sidorov (Inst. of High Pressure Phys., Acad. of Sci., Troitsk, USSR).

Phys. Status Solidi b (Germany), vol.116, no.1, p.83-9 (1 March 1983).

The thermopower and the relative electrical resistance of rhombohedral $\alpha\text{-GeTe}$ and orthorhombic $\gamma\text{-GeTe}$ polycrystalline samples with hole density between 3.9×10^{20} and 2×10^{21} cm $^{-3}$ are measured under hydrostatic pressure up to 8.5 GPa at room temperature. The phase transition of $\alpha\text{-GeTe}$ to the cubic rocksalt structure ($\beta\text{-GeTe}$) reported earlier at 3.5 GPa under nonhydrostatic pressure is not observed up to 8.5 GPa. Orthorhombic $\gamma\text{-GeTe}$ also exhibits no phase transition. The pressure dependences of the thermopower provide support for the multiple valence-band model of GeTe. (28 refs.)

62439 Thermo-EMF in bounded semiconductors under conditions of electron drag by phonons. A.M.Konin (Inst. of Semiconductor Phys., Acad. of Sci., Vilnius, Lithuanian SSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1209-10 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1877-80 (Oct. 1982). [received: April 1983]

The author deals with the dependence of the thermo-EMF of bounded semiconductors on the drag of electrons by phonons subject to realistic boundary conditions. The case of a local equilibrium of the phonon system is considered (it is assumed that long- and short-wavelength phonons have a common temperature and directional momentum). (6 refs.)

72.30 HIGH-FREQUENCY EFFECTS; PLASMA EFFECTS

62440 Nonreciprocal HF signal transmission by surface helicon. G.Ruibys, R.Tolulis (Inst. of Semiconductor Phys., Acad. of Sci., Vilnius, Lithuanian SSR).

Electron. Lett. (GB), vol.19, no.8, p.273 (14 April 1983).

Nonreciprocity of surface helicon propagation, its typical property which may be useful in practice, is stated experimentally. For this purpose the surface helicon has been separated from the bulk wave. The technique of wave reflection from a groove of different depth cut on the semiconductor surface was used. Some other surface helicon characteristics are also discussed. (3 refs.)

62441 Possibility of amorphous glassy state in astrophysical dense plasmas. S.Ichamaru, H.Iyetomi (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).

Phys. Scr. (Sweden), vol.T2, no.2, p.560-1 (1982). [received: April 1983]

(1982 International Conference on Plasma Physics, Göteborg, Sweden, 9-15 June 1982). Microscopic analysis on the basis of the improved hypernetted chain equations shows that the plasma fluid may form a metastable glassy state in the supercooled domain over a wide range of plasma parameters. Transition time from the metastable state to the crystalline state is estimated to be sufficiently large so that the possibility of the glassy state has an astrophysical relevance. (10 refs.)

62442 Hot-carrier thermo-EMF created by a strong microwave electric field in $\text{Ge}_{1-x}\text{Si}_x$ single crystals irradiated with fast electrons. A.Sh.Abdinov, A.K.Abiev, M.Ya.Bakirov, Yu.G.Nurullaev (Acad. of Sci., Baku, Azerbaizhdan SSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1173-4 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1828-30 (Oct. 1982). [received: April 1983]

The hot-carrier thermo-EMF U_T was detected and investigated in fast-electron-irradiated n - and p -type $\text{Ge}_{1-x}\text{Si}_x$ single crystals at temperatures

77-2500K. The study was carried out on samples with $x=0.05$ and $x=0.15$. It was found that the dependence $U_T(E)$ obtained for the fast-electron-irradiated $\text{Ge}_{1-x}\text{Si}_x$ single crystals differed considerably from the corresponding dependence in the case of unirradiated samples. (6 refs.)

62443 Investigation of the relaxation of the electrical conductivity in crossed alternating electric and static magnetic fields. V.Denis, Z.Martunas, G.Tvardauskas (Inst. of Semiconductor Phys., Acad. of Sci., Vilnius, Lithuanian SSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1193-4 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1856-8 (Oct. 1982). [received: April 1983]

An important parameter of a hot semiconductor plasma is the energy relaxation time τ_e . Accurate results can be obtained by a method based on the determination of the frequency dependence of the effective nonlinear coefficient α^* . The authors use a phenomenological theory to consider how the inertia of this process is reflected in the frequency dependence of the coefficient α^* . They consider a nondegenerate semiconductor with a simple isotropic band structure. An experimental check of the theoretical predictions was made on samples of chromium-compensated n-type InSb. (5 refs.)

Calculation of the EELS spectra of the Ni(001) surface with $p(2 \times 2)$ and $c(2 \times 2)$ overlayers of oxygen See Entry 63098

72.40 PHOTOCONDUCTION AND PHOTOVOLTAIC EFFECTS; PHOTODIELECTRIC EFFECTS

62444 Mechanochemical effect in ZnTe powder associated with grinding. M.Takeuchi (Dept. of Electrical Engng., Ibaraki Univ., Hitachi, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.460-3 (March 1983). Single crystalline ZnTe powder was mechanically ground in air using an agate mortar and pestle, and changes in the structural and photoconductive properties were studied. The mean particle size was reduced to about 5 μm in the early stage of grinding. In the X-ray diffraction patterns, Te and ZnO lines appeared as 5 h and 8 h grindings, respectively. However, all the diffraction lines disappeared after 50 h grinding. Dark current in the ground ZnTe powder becomes maximum around 8 h grinding. This can be explained by the separation of Te associated with grinding. The original ZnTe powder showed photoconductive sensitivity to visible light. The sensitivity increased slightly in the early stage of grinding and then decreased with further grinding. Temperature dependences of the dark currents were measured in the temperature range of 170-370K. (11 refs.)

62445 PbO/CdS, Se/Cu mixed photoconductor system for electrophotography. Navneet, P.K.C.Pillai (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.508-10 (March 1983). A mixed system, consisting of lead monoxide (PbO) and cadmium sulfide selenide Cd(S, Se):Cu in acrylonitrile-butadiene-styrene (ABS) binder resin has been investigated with respect to electrophotographic characteristics. PbO and Cd(S, Se):Cu in 80:20 composition (by weight), when dispersed in ABS binder, (30% by weight) give optimum values for various electrophotographic parameters. Charge acceptance, dark and photoinduced decay, contrast potential and spectroresponse were the important electrophotographic properties, studied. The acceptance potential of the charged layer was 1092 volts. The fractional dark decay (observed 60 seconds after the charging) and fractional photoinduced decay (observed 10 seconds after the start of illumination) were 35.5% and 79.4% respectively. The intensity of illumination was 4.5 mW/cm². The absorption spectrum of the material spreads over a wide range covering UV as well as visible region.

62446 Measurement of photoconductivity at HgI₂ single crystals doped with iodine. K.Muller (Sektion Phys., Tech. Univ. Dresden, Dresden, Germany), A.I.Schulz.

Exp. Tech. Phys. (Germany), vol.31, no.1, p.89-96 (1983). In German. Presents the measurement of photoconductivity of two HgI₂ single crystal samples doped with iodine in concentrations 0.3 and 1.2 wt.%. After measuring photocurrent the samples were cleft in detector slices. The photocurrent I_{ph} was investigated versus irradiation intensity I_L at constant wavelength ($\lambda=555\text{--}570\text{ nm}$) and is given by $I_{ph} \sim I_L^\gamma$. The I_{ph} - I_L curves were characterized by the slope, the γ -value. The slices of sample doped with an iodine concentration 0.3 wt.%, having exhibited a γ -value of 0.95, showed a nearly linear photoconductivity and better detection properties than slices of sample doped with iodine in concentration 1.2 wt.% at which lower γ -values have been measured. In this manner a relationship between photocurrent and detection properties could be pointed out. It can be assumed that determination of photocurrent and estimation of γ -value allow a prediction of detector properties. (22 refs.)

62447 Photothermopower of a-As₂Te₃ sputtered films. D.M.Chui (Dept. of Electrical Engng., Univ. of Edinburgh, Edinburgh, Scotland).

J. Phys. D (GB), vol.16, no.4, p.L81-3 (14 April 1983). Photothermopower measurements on a-As₂Te₃ sputtered films reveal that within the temperature range 320-200K, both ambipolar and unipolar conduction are responsible for the conduction mechanism, in contrast with the previous belief that only unipolar conduction governs the behaviour of such material. However, outside this temperature range a unipolar conduction mechanism (holes) is found to be predominant. (1 ref.)

62448 Photochemical reactions in CdS_{1-x}Se_x single crystals. D.Raja Reddy, B.K.Reddy, P.J.Reddy (Dept. of Phys., SV Univ. Coll., Tirupati, India).

J. Phys. D (GB), vol.16, no.4, p.645-52 (14 April 1983). Thermally stimulated current (TSC) measurements in the temperature range 90-400K were carried out on vapour-phase grown CdS_{1-x}Se_x single crystals over the full range of x (1.00, 0.90, 0.70, 0.50, 0.30, 0.10 and 0.00) by continuously exciting the crystals from different temperatures while cooling (TEWC) in the range 400-90K. Large changes in the peak currents were observed for different illumination conditions. The existing photochemical models are not able to explain the TSC dependence on TEWC observed in the crystals. A tentative photochemical model which takes into account the variation of photochemical reaction with composition has been proposed. (16 refs.)

62449 A physicochemical interpretation of the photoconductivity of a-Si:H. H.Hamdi, A.Deneuville, J.C.Bruyere (Groupe des Transitions de Phases, CNRS, Grenoble, France).

J. Phys. Lett. (France), vol.44, no.7, p.L265-9 (1 April 1983). Total hydrogen content and its distribution among SiH, SiH₂ and other H' sites of sputtered a-Si:H films vary after posthydrogenation but the dangling bond concentrations remain constant. This can be explained by preferential H

diffusion in the tissue zone where most of the hydrogen is located, while the residual dangling bonds are in the islands. The photoconductivity is controlled by spinless defects of the tissue zone originating from back defects of H on their various sites. It decreases as the relative SiH₂ content increases. (14 refs.)

62450 One- and two-photon excited picosecond conductivity in CdS. V.Bruckner, F.Kerstan (Friedrich-Schiller-Univ., Sektion Phys., Jena, Germany).

Opt. Commun. (Netherlands), vol.45, no.3, p.187-93 (1 April 1983). Fast optoelectronic switching in CdS was studied in the case of high intensity picosecond laser excitation. At both one- and two-photon excitation two different mechanisms of the carrier recombination are measured and studied: recombination at slow centers (300-500 ns) and fast recombination (~700 ps) at high excitation levels, which may be explained by stimulated processes. A wide dynamic range in the switching efficiency was measured and discussed. (18 refs.)

62451 Low-frequency oscillations of the photocurrent in trigonal selenium single crystals. G.S.Kavalyauskene, V.S.Rinkyavichyus (V. Kapsukas State Univ., Vilnius, Lithuanian SSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1190-1 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1853-5 (Oct. 1982). [received: April 1983]

Low-frequency oscillations of the photocurrent were observed only in those trigonal selenium single crystals which were characterized by a dark current-voltage characteristic with a saturation region of the kind reported earlier for ZnS:Mn single crystals. The minimum critical field necessary for the excitation of these oscillations were 5.10⁵ V/cm. The oscillations appeared on illumination with light of wavelengths from 0.56 to 0.62 μm , corresponding to the maximum of the sensitivity region. (12 refs.)

62452 Singularity of the photoconductivity spectrum of tellurium-doped germanium. N.B.Radchuk, A.Yu.Ushakov (M.I. Kalinin Polytech. Inst., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1192 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1855 (Oct. 1982). [received: April 1983]

The authors have studied the photoconductivity spectrum of partly compensated Ge:Te and found a sharp peak at a photon energy 375 meV with a half-width 5.5 meV measured at the 0.9 level of the maximum amplitude. The signal at the peak maximum was 1.5-5 times greater than the signal due to the neighboring parts of the spectrum. (3 refs.)

62453 Flash nature of the kinetics of growth of the photocurrent in glassy arsenic sulfide. N.G.D'yachenko, A.Yu.Popov, M.Yu.Trofimenko, A.V.Tyurin, A.S.Sheveleva (Sci.-Res. Inst. of Phys., I.I. Mechnikov State Univ., Odessa, USSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1205-6 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1872-4 (Oct. 1982). [received: April 1983]

The authors study the flash nature of the photocurrent growth kinetics in the As₂S₃ chalcogenide glass. Photoconductivity measurements were made using a plane parallel plate of thickness ~0.3 mm covered with Al electrodes. (10 refs.)

62454 Nature of the photoconductivity and mobility anisotropy of photoelectrons in LiNbO₃:Fe. A.R.Pogosyan, B.N.Popov, E.M.Uyukin (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1448-51 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2551-7 (Sept. 1982). [received: April 1983]

The photorefractive and bulk photovoltaic effects in an external magnetic field were studied for the first time. The photoconductivity of lithium niobate was found to be largely due to the presence of nonthermalized electrons in the conduction band. A strong anisotropy of the mobilities of photovoltaic electrons was revealed, as well as a transverse photomagnetoconductance, together with transverse and longitudinal photovoltaic magnetoconductance effects in LiNbO₃:Fe crystals. (9 refs.)

62455 Photoelectric phenomena accompanying diffraction of X-rays in semiconducting crystals. A.M.Afanasyev, E.A.Manykin, E.F.Lobanovich, M.V.Koval'chuk, R.M.Imamov (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1473-6 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2599-604 (Sept. 1982). [received: April 1983]

The formation of an EMF accompanying irradiation of a p - n junction by X-rays under diffusion conditions is examined theoretically. The influence function that describes the contribution of current carriers created at different depths from the surface to the induced photo-EMF is determined. It is shown that the asymmetry of the photo-EMF curve in the region of diffraction angles is related to a characteristic length, which in this case is the diffusion length of the minority carriers. The theoretical results are illustrated by experimental data obtained for silicon p - n junctions having different resistivities. (7 refs.)

62456 Relative influence of grain boundaries and intragrain defects on the photocurrents obtained with Bridgman polysilicon. H.Amzil, M.Zchaf, J.P.Crest, E.Psaila, S.Martinuzzi (Lab. de Photoelectricite des Semiconducteurs, Univ. d'Aix-Marseille III, Marseille, France), J.Oualid.

Sol. Cells (Switzerland), vol.8, no.3, p.269-81 (April 1983). Photocurrents in Bridgman polysilicon were studied globally on small mesa diodes which were revealed on n^+ - p photocells cut from different regions of ingots (top, middle or bottom or periphery or centre), and locally by means of light-beam-induced current mappings. Their dependence on the electronic properties (the diffusion lengths) and on the physical properties (the number of grains per diode, the dislocations, the doping level etc.) was analysed. It was shown that the weaker the intragrain defect density and the conductivity are, the greater is the influence of the grain size on the electrical properties. This was confirmed by light-induced currents. It was shown that the photocurrents are more dependent on the grain size than on the diffusion length. The defects (the grain boundaries or dislocations) also have a strong influence on the dark forward current-voltage characteristics $I_f=f(V_f)$ and on the capacitance-reverse voltage curves $C^{-2}=f(V_R)$. (10 refs.)

62457 Light effects on grain boundary properties in silicon. L.J.Cheng, C.M.Shyu (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).

Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.105-10

The authors have studied the photoconductivity of grain boundaries in p -type silicon. The result demonstrates the applicability of the technique for the measurement of minority carrier recombination velocity at the grain boundary. The experimental data are consistent with the thought that the recom-

- bination velocity increases with the boundary state density and light intensity. (9 refs.)

72.50 ACOUSTOELECTRIC EFFECTS

- 62458 Acoustoelectric wave in a piezoelectric semiconductor with a Schottky barrier. D.A.Letnik, V.V.Popov (State Univ., Omsk, USSR). *Sov. Phys.-Semicond. (USA)*, vol.16, no.10, p.1200-1 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1865-7 (Oct. 1982). [received: April 1983]
- The authors consider an acoustoelectric instability which appears on application of a constant bias to a piezoelectric semiconductor with one ohmic contact and the other contact in the form of a Schottky barrier. An acoustoelectric wave modulates not only the carrier density near the barrier but also the barrier height, and this makes it possible to generate oscillations in a sample. (4 refs.)

72.60 MIXED CONDUCTIVITY AND CONDUCTIVITY TRANSITIONS

- 62459 Transport properties of tungsten bronzes doped with tantalum. P.P.Dordor, J.P.Doumerc, G.Villeneuve (Lab. de Chimie du Solide, Talence, France). *Philos. Mag. B (GB)*, vol.47, no.3, p.315-22 (March 1983). In French.
- The thermoelectric power of several $\text{Na}_x\text{Ta}_y\text{W}_{1-y}\text{O}_3$ bronzes have been measured between 4.2 and 900K. As the number of d electrons decreases, a metal-non-metal transition occurs, which is ascribed to Anderson localization. The transport properties of the non-metallic samples are described in terms of three different hopping mechanisms at the Fermi level. With rising temperature, first variable-range hopping, then Miller-Abrahams (1960) and finally Heikes hopping successively prevail. (9 refs.)
- 62460 Influence of hydrostatic pressure on the electrical properties of filamentary tellurium crystals. S.S.Varshava, L.N.Pelekh, B.I.Sydir (Lenin Komsomol Polytech. Inst., Lvov, Ukrainian SSR). *Sov. Phys.-Semicond. (USA)*, vol.16, no.10, p.1196-7 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1861-3 (Oct. 1982). [received: April 1983]
- The authors report a study of the influence of hydrostatic pressures up to $5 \cdot 10^8$ Pa on the electrical properties of filamentary Te crystals of different shapes (acicular, tubular, platelet) and dimensions. At room temperature the investigated samples exhibited mixed conductivity values of 0.1-0.5 Ωcm . The pressure coefficients of the band gap were also determined. (8 refs.)
- 62461 Metallization of mercury chalcogenides under ultrahigh pressures. I.M.Tsidil'kovskii, V.V.Shchennikov, N.G.Gluzman (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.9, p.1507-9 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2658-62 (Sept. 1982). [received: April 1983]
- The electrical resistance of the mercury chalcogenides HgTe , HgSe , and $\alpha\text{-HgS}$ under pressures up to 400kbar at 293-400K was studied in metal and diamond high pressure chambers. It is shown that the resistance and the band gap of the hexagonal modifications of the chalcogenides with the cinnabar ($\alpha\text{-HgS}$) structure decrease rapidly with rising pressure. This narrowing of the gap corresponds to the high compressibility of the hexagonal phases in HgTe , HgSe , and $\alpha\text{-HgS}$. Phase transitions to the metallic state were found at 100 ± 10 kbar for HgTe , 210 ± 20 kbar for HgSe , and 300 ± 30 kbar for $\alpha\text{-HgS}$. The hexagonal phases are shown to be similar to the group VI semiconductors selenium and tellurium. It is conjectured that the crystal and band structures of the mercury chalcogenide metallic phases are similar to those of the high-pressure metallic phases of selenium and tellurium. (12 refs.)

- 62463 Fractal dimensions and $1/f$ noise. R.Benzi (Centro Sci. IBM, Roma, Italy), L.Peliti, A.Vulpiani. *Lett. Nuovo Cimento (Italy)*, vol.36, ser.2, no.14, p.471-4 (2 April 1983).
- Considers theoretically the noise spectrum in metal films and in carbon resistors which shows a power law behaviour as a function of frequency with an exponent near to -1 . The current circulating in the resistor is viewed as a charged, weakly compressible fluid, and magnetohydrodynamics equations are applied. Using this theory both the power law dependence and the role of the system dimensionality are explained. (14 refs.)

72.90 OTHER TOPICS IN ELECTRONIC TRANSPORT IN CONDENSED MATTER

- 62465 Two-dimensional inhomogeneous systems in strong magnetic fields. IV. L.V.Gorodza, Yu.P.Emets (Inst. of Electrodynamics, Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1047-51 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1705-11 (Sept. 1982). [received: April 1983]
- For pt.III see *ibid.*, vol.27, p.389 (1982). Electric fields are calculated analytically and the effective parameters of the medium are evaluated for a continuous medium containing inhomogeneities in the form of highly conductive ribbons distributed in a regular order. When the Hall effect appears in the medium, the effective conductivity tensor depends strongly on the orientation of the inclusions with respect to the directions of the external electric and magnetic fields. The systems examined in the present work have regularly distributed inhomogeneities directed across the external magnetic field. The components of the conductivity tensor are studied as functions of the density of inclusions and the strength of the magnetic field. (2 refs.)

73.00 ELECTRONIC STRUCTURE AND ELECTRICAL PROPERTIES OF SURFACES, INTERFACES, AND THIN FILMS

73.20 ELECTRONIC SURFACE STATES

(for emission and impact phenomena, see 79.)

- 62466 Distance dependence of electronic energy transfer to semiconductor surfaces: $\pi\pi^*$ pyrazine/ $\text{GaAs}(110)$. P.M.Whitmore, A.P.Alivisatos, C.B.Harris (Dept. of Chem. & Materials & Molecular Res., Univ. of California, Berkeley, CA, USA). *Phys. Rev. Lett. (USA)*, vol.50, no.14, p.1092-4 (4 April 1983).
- Energy transfer from $\pi\pi^*$ pyrazine to $\text{GaAs}(110)$ has been studied. Within experimental error, a classical dielectric model quantitatively reproduces measurements of the distance-dependent lifetime for emitter-surface separations from 430 to 20 Å. Analysis of the energy transfer shows that the molecular electronic excitation is dissipated through the creation of electron-hole pairs in the solid by the high-wave-vector components of the dipole near field. (10 refs.)
- 62467 Wave functions for surface states of a distorted surface. J.Neuberger (Dept. of Phys., Queens Coll., City Univ. of New York, Flushing, NY, USA), C.L.Roy. *Physica B & C (Netherlands)*, vol.115 B+C, no.2, p.172-8 (Jan. 1983).
- The form of the wave function to be used in a one-dimensional disordered system for the purpose of obtaining surface states is investigated. Two cases are considered: one where the defect occurs to the left of the origin and the second where the first cell is distorted. It is demonstrated that the two cases which seemingly yield quite different forms are actually the same, aside from an obvious change in sign. A more fundamental question which raises some doubt about the validity of Kronig-Penney wave functions to cells which are not periodic is pointed out. (6 refs.)
- 62468 Interaction of charges with metallic surfaces—invalidity of the surface plasmon model. M.Babiker (Phys. Dept., Univ. of Essex, Colchester, England). *Physica B & C (Netherlands)*, vol.115 B+C, no.3, p.339-66 (March 1983).
- It is argued that the surface plasmon (SP) model, according to which metallic surfaces manifest their interaction with a charge e only through the surface excitations, is invalid. A careful enumeration of the modes of the electromagnetic field in the presence of a (spatially dispersionless) jellium half-space is presented together with explicit calculations for the Coulomb potential on a charge outside the jellium. This potential is shown to arise from both volume (α) modes and surface (β) modes whose contributions are then discussed separately in various limits. In particular it is shown that the potential due to the surface modes subject to the so-called quasistatic approximation $c \rightarrow \infty$, i.e. $\mu \rightarrow 0$ ($\mu = 2Z/\lambda_p \approx 2Z\omega_p/c$, where ω_p is the bulk plasma frequency and Z the distance of the particle from the surface), agrees in magnitude but not in sign with the result in this limit of the (SP) model, while the total potential for finite μ is drastically different from the predictions of the (SP) models, while the total potential for finite μ is drastically different from the predictions of the (SP) model. It is argued that, for finite ω_p , the limit $c \rightarrow \infty$ is incompatible with the jellium assumption $\mu \rightarrow \infty$ represents the small Z limit, and analogy with classical theory is therefore inappropriate. The limit $\mu \rightarrow \infty$ represents the true classical limit of the theory. Here, the total potential is shown to arise predominantly from the volume (α) modes and it has the correct classical behaviour $-\epsilon/4Z$. The total potential is presented as a function of μ both analytically and graphically and implications of its form for the detailed properties of the particle near the metallic surface are discussed. (23 refs.)

- 62469 Electronic structure of hydrogen-bonded H_2O . D.Schmeisser, F.J.Himpel, G.Hollinger, B.Reihl (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), K.Jacobi. *Phys. Rev. B (USA)*, vol.27, no.6, p.3279-86 (15 March 1983).
- The authors have studied the electronic structure of H_2O adsorbed on different metal surfaces between 7 and 200K using photoelectron spectroscopy. From the valence-orbital spectra they are able to distinguish three different phases of adsorbed H_2O : (a) single-adsorbed H_2O molecules at temperatures close to the desorption point, (b) partially hydrogen-bonded H_2O clusters for coverages of a monolayer or less, and (c) fully hydrogen-bonded ice at low temperatures and several monolayers of coverage. For phase (a), they find valence molecular orbitals which are almost rigidly shifted upwards relative to the gas phase by a final-state relaxation shift of 1.3 eV. All orbitals are broadened by 1.0-1.5 eV relative to the gas phase. For phase (b), two inequivalent types of H_2O molecules whose orbital energies differ by 1.5-2 eV are identified. This splitting is identical to the electrostatic shift of molecular-orbital energies as calculated for the hydrogen-bonded H_2O dimer by Umeyama and Morokuma (1977). In this model the set of molecular orbitals with higher binding energy is assigned to the hydrogen-acceptor molecule and the set with lower binding energy to the hydrogen-donor molecule. At

monolayer coverage about twice as many donors as acceptors are found. (27 refs.)

62470 Barrier height and surface states at cleaned InSb(110) surfaces. E.W.Kreutz, E.Rickus, N.Sotnik (Inst. für Angewandte Phys., Tech. Hochschule Darmstadt, Darmstadt, Germany). *Thin Solid Films (Switzerland)*, vol.101, no.2, p.153-65 (11 March 1983). The electronic properties of p-InSb(110) surfaces which were cleaned by the ion bombardment annealing technique are investigated by measurements of the integral and differential field effects. The field-induced changes in surface conductivity imply inversion layers with electron conduction in the space charge layer. The analysis of the experimental results yields the barrier height at the surface and the term spectrum of surface states. The general shape of the surface state density per energy interval shows a disorder-dependent continuous distribution with a minimum about midgap and increasing tails towards the bulk band edges. Near the conduction band minimum a peaking distribution of donor-type surface states is superimposed on the continuous distribution depending on the ion bombardment annealing conditions. The nature of the spectrum of surface states is discussed on the basis of intrinsic and extrinsic states. (39 refs.)

62471 Electronic structure of the $\text{Me}_2\text{S}_8^{n+}$ cluster units in Mo_2S_8 , $\text{M}_2\text{Re}_2\text{S}_8$ (M=Na, K) and $[\text{Fe}_2\text{S}_8][\text{P}(\text{Et})_3]_n$ analogs to Mo_2S_8 , Re_2S_8 and Fe_2S_8 adsorbate structures. F.Dubler, H.Müller (Sektion Chemie, Friedrich-Schiller-Universität, Jena, Germany). *Wiss. Z. Friedrich-Schiller-Universität, Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.907-17 (1982). In German. By means of the SW-Xa-method the valence electronic structures of the common $\text{Me}_2\text{S}_8^{n+}$ -unit of the 3 title compounds has been calculated. A comparison of the results with previously discussed bonding schemes for such octahedral cluster compounds has been made. The result is that these bonding schemes do not apply in general to the considered cluster compounds. Thermochemical, spectroscopic and structural features of this class of compounds show relationships to the corresponding adsorption of sulfur on Mo, Re and Fe surfaces. (42 refs.)

62472 SW-Xa investigation of the electronic structure of palladium clusters. H.-G.Fritsche (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Universität, Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.919-29 (1982). In German. The electronic structures of O_h -symmetrical clusters Pd_6 , Pd_{13} , Pd_{14} calculated by the SW-Xa-method are compared with the electronic structure of the periodic Pd-lattice obtained by an APW-calculation. The influences of electronic configurations and additional scattering centers on the valence-bands of clusters are investigated. It is shown that SCF-calculations can only give better results for nearly isolated structural units. The rapid convergence of cluster-properties obtained by SW-Xa-method to APW-bulk-properties is discussed as a consequence of muffin-tin-approximation. (22 refs.)

62473 How local is the bonding of absorbed hydrogen to the host metal? An attempt at answering the problem in the framework of the SW-X_a method for the α -Pd/H system. H.-G.Fritsche, H.Müller (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Universität, Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.931-42 (1982). In German. The absorption of small amounts of atomic hydrogen in palladium (α -phase) was investigated by SW-Xa-calculations considering two Pd-spheres. The installation of hydrogen causes an energetical change in the spectrum and a local modification of the electronic density. The region near to the proton accepts electrons donated by the spheres around the palladium-atoms of the second neighbourhood to the proton. The charge transfer into the hydrogen-sphere is an effect of strongly localized interactions between hydrogen and 6 neighbouring palladium atoms. The orbitals of the so-called rigid band play an important role in the more delocalized alterations of electronic density in regions between palladium-atoms of the first and second neighbourhood to hydrogen. (23 refs.)

62474 Theoretical investigation of the multiple bond in complexes of the type $[\text{Re}_2\text{Cl}_8]^{2-}$. C.Opitz, H.Müller, R.Kastner (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Universität, Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.943-8 (1982). In German. The energy of the metal-metal-bond of complexes of the type $[\text{Me}_2\text{X}_8]^{n-}$ (Me=Re, Mo, Te; X=Cl, Br) has been evaluated in the frame of a simple free electron model and compared with experimental data. Due to the analysis of the bonding orbitals quadruple or stronger Me-Me-bonds have been found, corresponding to $\sigma^* \pi^{*2}$ and $\sigma^* \pi^{*3}$ bonding configurations. The charge density distribution of the bonding orbitals has been drawn. (15 refs.)

62475 Quantum chemical investigation on the mutual exchange of the solid surface with an atom using the partitioning technique. L.D.Kunne, A.Horn-bogen (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Universität, Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.949-61 (1982). In German. The partitioning technique is a useful mathematical tool to solve the eigenvalue problem in quantum chemistry. The authors apply this technique to the case of chemisorption of one atom on a solid surface. Using the tight binding approximation they obtain a simple equation to determine the eigenvalues, and closed formulae for the LCAO coefficients and charge distribution. These formulae bring to light three different kinds of interaction between the chemisorbed atom and the individual molecular orbitals of the solid. The applicability of the formulae is demonstrated in the case of chemisorption of H on Ni (100) surface. (10 refs.)

73.25 SURFACE CONDUCTIVITY

62476 Irregularity in the electrical conductivity of technical-grade pericase. M.A.Samokhvalov (V.V. Kuibyshev Tomsk State Univ., Tomsk, USSR).

Inorg. Mater. (USA), vol.18, no.6, p.889-90 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1051-2 (June 1982). [received: Feb. 1983]

To study the irregularity in the electrical conductivity of pericase, the authors developed a method of dry decoration of the volume conducting channels. The pericase sample was prepared in the form of plane-parallel plates with linear dimensions much larger than the thickness. One surface of the plate was coated with metal, while the other was processed thoroughly to decrease the surface conductivity. Charge was applied uniformly to the processed surface. The sample was then placed in a furnace on a grounded plate and allowed to discharge for a period of time. At the end of the discharge period, the irregular distribution of the charge on the surface of the sample reflects the irregularity in its electrical conductivity. The charge distribution becomes visible after decoration of the surface of the sample with finely dispersed charged particles of chromium oxide or other material. The results of decoration are then studied by means of an optical microscope. (1 ref.)

62477 An experimental test of the scaling theory of conduction in two dimensions. R.A.Davies, M.Pepper, M.Kaveh (Cavendish Lab., Univ. of Cambridge, Cambridge, England).

J. Phys. C (GB), vol.16, no.10, p.L285-9 (10 April 1983). The scaling theory of conduction has created much interest in the problem of conduction in a disordered system. Basic to this theory is the assumption that a one-parameter scaling function exists. An experimental test of this is presented for two-dimensional transport in silicon inversion layers. The results are found to be inconsistent with such an assumption and the authors conclude that the function does not exist. (17 refs.)

62478 Mechanism for local charge transport on the surface of a transparent ferroelectric ceramic. A.E.Krumin', U.Yu.Ilin', V.I.Dimza (Petr Stuchka State Univ., Latvian SSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1294-5 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2107-9 (Oct. 1982). [received: April 1983]

The goal of the work was to study surface phenomena in transparent ferroelectric ceramics by using pointed metal electrodes to transport charge carriers to the surface levels of a ferroelectric ceramic in the external field produced by the trapped carriers. A characteristic property of ferroelectrics, including transparent ferroelectric ceramics, is that this field can be observed directly because of the electrooptical effect. A transparent ferroelectric ceramic of composition ZTLX-X (lead zirconate and titanate modified with lanthanum) was studied where $X=8, 9, 10$ is the density of lanthanum ions in at.%. For purposes of comparison BaTiO_3 , $\text{Pb}(\text{Mg}_{1/3}\text{Nb}_{2/3})\text{O}_3$, KNbO_3 , and $(\text{BaSr})\text{Nb}_2\text{O}_6$ single crystals were also investigated. It is believed that the main charge transport mechanism involves tunneling of charge carriers across the metal-air interface and trapping near the surface of transparent ferroelectric ceramics. Charge localization results from two interdependent processes occurring in the intense electric field E near the sharp points of the electrodes. (4 refs.)

62479 Investigation of the influence of water on the surface conductivity of optical glass. D.Lenke, C.Nitschke (Friedrich Schiller Univ., Jena, Germany).

Wiss. Z. Friedrich-Schiller-Universität, Jena, Math. Naturwiss. Reihe (Germany), vol.31, no.6, p.1039-43 (1982). In German. The influence of water on the behaviour of optical glasses was investigated by means of surface conductivity measurements. The applied measuring method permitted statements on the ion exchange processes of the surface area. Differences in the corrosion tendency are discussed in dependence on the volume content of glasses. (14 refs.)

73.30 SURFACE DOUBLE LAYERS, SCHOTTKY BARRIERS, AND WORK FUNCTIONS

62480 Work function measurements on ion bombardment damaged (111) surface of silver by photoelectric and CPD methods. M.Chelvyayohan (Dept. of Pure & Appl. Phys., Queen's Univ. of Belfast, Belfast, N Ireland).

J. Phys. C (GB), vol.16, no.11, p.L323-5 (20 April 1983). Silver (111) surfaces damaged by argon ion bombardment showed a photoelectric work function higher than that measured by the CPD method. This observation is explained as being due to the effect of the surface defects on the surface potential barrier and hence on the photothreshold. (4 refs.)

62481 Electrical properties of Mo-cadmium chalcogenide Schottky barrier diodes. V.B.Bikbaev (V. Kapsukas State Univ., Vilnius, USA), S.C.Karpinskys, J.J.Vaitkus.

Phys. Status Solidi a (Germany), vol.75, no.2, p.583-90 (16 Feb. 1983). The electrical properties of Mo-cadmium chalcogenide Schottky barrier diodes formed by deposition of a semiconductor on Mo substrate in the flow of H_2 are investigated. From analysis of I - U , C - U , and I - T curves the parameters of the diodes are determined. It is found that the dominant current mechanism both, in forward and reverse directions is tunneling. The experimental results are in a good qualitative agreement with theoretical calculations. An inhomogeneous contact model originating from the growth conditions of polycrystalline films is proposed for explaining the quantitative disagreement between theory and experiment. The influence of the inhomogeneous barrier height distribution on the area of the contact on the thermionic emission current is discussed. (14 refs.)

62482 A simple formula for the electron work function of metals. B.Ya.Moizhes, V.A.Nemchinskii (All-Union Sci. Res. Inst. of Current Source Technol. & Design, Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1298-300 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2111-14 (Oct. 1982). [received: April 1983]

In 1956 Gordy and Thomas (see *J. Chem. Phys.*, vol.24, p.439, 1956) established the equation $x_p = 0.44\phi$ (eV) - 0.15 relating the work function ϕ and electronegativity x in metals (here 0.44 and 0.15 are correlation parameters). There are two basic electronegativity scales in use for the chemical elements: the Pauling electronegativity x_p which is calculated from molecular bond energy data, and the Milliken electronegativity $x_M = (I + E)/2$ where I is the ionization potential and E the electron affinity of a free atom. The authors try to account for the equation using the theory of quasifree electrons in a periodic crystal field (which has been used successfully to explain the shape of the Fermi surface). The Wigner-Seitz cell model gives especially simple expressions for the alkali metals. (19 refs.)

62483 Charging characteristics of a gallium arsenide surface upon gas adsorption. F.E.Shakalov, I.A.Kirovskaya.

Inorg. Mater. (USA), vol.18, no.5, p.609-12 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.720-3 (May 1982). [received: Feb. 1983]

Quantitative characteristics of a real, charged GaAs surface were found through a combination of measurements of surface conductivity, contact potential difference, Hall effect, and current-voltage plus capacitance-voltage characteristics. The results showed satisfactory correlation with the literature as to the original evacuated surface. A mechanism was presented for the surface produced by gas adsorption. (7 refs.)

Irregularity in the electrical conductivity of technical-grade pericase See Entry 62476

73.40L Semiconductor-to-semiconductor contacts, p-n junctions, and heterojunctions

62484 Electric field effect on the thermal emission rate of holes trapped at gold donor center in Si p-n junction. Chen Kaimao, Mao Jinchang (Dept. of Phys., Peking Univ., Peking, China).

Chin. J. Semicond. (China), vol.4, no.2, p.142-8 (March 1983). In Chinese. In the temperature range from 115.2 to 162.3K, the electric field effect on the thermal emission rate of holes trapped at gold donor center in silicon p-n junction has been studied using the capacitance transient technique. The results obtained show that the electric field in the junction has great influence on the thermal emission rate. This influence depends strongly on the temperature. This can be explained by the lowering of the polarization potential barrier caused by the strong electric field in the junction. The form of polarization barrier is $V(r) = -Ar^{-4}$. In the temperature range studied A is from 8.8×10^{-27} to 1.1×10^{-27} eV·cm⁴. The effect of the boundary layer of space charge region on the measured results of the field dependence on thermal emission rate has been considered for the first time and a revised method suggested. (12 refs.)

62485 Energy loss rate in silicon inversion layers. M.C.Payne, R.A.Davies, J.C.Inkson, M.Pepper (Cavendish Lab., Univ. of Cambridge, Cambridge, England).

J. Phys. C (GB), vol.16, no.10, p.L291-9 (10 April 1983). The authors report the results of measurements on the rate of heat loss from hot electrons in silicon inversion layers at low temperatures. The results are interpreted in terms of the generation of acoustic phonons and it is found that disorder has a significant effect on this mechanism. In the low-disorder, high-temperature limit the energy relaxation time τ_e varies with electron temperature T_e as T_e^{-4} . In the high-disorder, low-temperature limit τ_e varies as T_e^{-2} . The electron temperature is measured by the effect on the weak two-dimensional localisation which allows the experiment to be performed at low temperatures. (19 refs.)

62486 Current-carrier transport in semiconducting heterojunctions. II. Experimental data on Si-Zn₃As₂ heterojunction. B.Kochan, J.M.Pawlikowski (Inst. of Phys., Tech. Univ. of Wrocław, Wrocław, Poland).

Mater. Sci. (Poland), vol.7, no.4, p.419-26 (1981). For pt.1 see ibid., vol.6, no.4, p.141 (1980). An application of well-known transport mechanisms of current carriers in semiconductor heterojunctions is discussed for the case of the Si-Zn₃As₂ heterojunction. Experimental results of current-voltage characteristics are compared with the theoretical ones obtained on the basis of the current-transport models and for Si and Zn₃As₂ data, so far available. The best fit was obtained for the Riben-Feucht tunneling-recombination model. The fitting parameters and schematic band diagram of the Si-Zn₃As₂ heterojunction is discussed. (18 refs.)

62487 p-n junctions in GaAs-GaSb solid solutions. A.Ya.Vul', V.N.Karyayev, P.G.Petrosyan, T.A.Polyanskaya, I.I.Saidashev, Yu.V.Shmaritsev (A.F. Ioffe Physicotech. Inst. Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1179-82 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1838-42 (Oct. 1982). [received: April 1983]

An investigation was made of p-n junctions in GaAs_{1-x}Sb_x ($x < 0.2$) solid solutions and the influence of mismatch between the lattice parameters of the substrate and epitaxial film on the current-voltage characteristics was analyzed. It was found that the breakdown of p-n junctions was of the tunnel nature. (24 refs.)

62488 Heterojunction formed from gallium selenide and indium selenide by laser melting. V.I.Tagirov, V.M.Salmanov, A.Sh.Mekhtiev, Kh.A.Asadov (S.M. Kirov State Univ., Baku, Azerbaidzhan SSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1214 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1885-6 (Oct. 1982). [received: April 1983]

Pulsed lasers are now used extensively in heterostructure fabrication. The authors aim was to determine the possibility of fabrication of heterojunctions from layer semiconductors by melting together two plates using high-power laser radiation. Semiconductor plates were irradiated from the wide-gap semiconductor side with a ruby laser operating under free-running conditions. The duration of a pulse was 6 msec. A heterojunction was formed from layer single crystals of p-type GaSe and n-type InSe. (2 refs.)

62489 On the passivation of p-n junctions in silicon through anodic oxidation. G.Mende, K.D.Butter, B.Schmidt (Zentralinst. für Kernforschung, Dresden, Germany).

Thin Solid Films (Switzerland), vol.102, no.1, p.65-9 (8 April 1983). In German.

An application of anodic SiO₂ for the passivation of electronic devices is advantageous especially in cases where low temperature passivation is preferred, e.g. for passivation of p-n junctions. It was demonstrated that the lifetime of minority carriers in silicon did not change after passivation with anodic SiO₂. Only a low current flows through anodically passivated nuclear radiation detectors under reverse bias. Such detectors have many applications, e.g. in α -spectrometry. (10 refs.)

62490 Electric and photoelectric characteristics of CdTe p-n homojunctions. F.Therez, A.Chicouche.

In Cellules solaires constituées de couches minces de CdTe polycrystallines (Solar cells made from polycrystalline CdTe thin films), 11 pp. Report EUR 8154 EN-FR, Comm. European Communities, Luxembourg (1982), 75 pp. In French. Contract 206-76 ESF.

Gives some experimental results on batches of CdTe p-n diodes to determine the fundamental parameters in darkness. These experiments were split into two types. The first type was epitaxial coatings without arsenic additive. Numerous graphs of experimental results are given, together with tabular figures obtained for various features. The second type was epitaxial coatings in the presence of a supplementary source of arsenic atoms. Again, a number of graphical results are presented and also tabular figures for various factors. The final section deals with characteristics under illumination of CdTe p-n epitaxialised diodes. Further graphical results are given, together with a few figures. (no refs.) G.V.D.

62491 Surface states at the TiO₂/H₂O interface under UV illumination. K.Kobayashi, M.Takata, S.Okamoto (Technol. Univ. of Nagaoka, Nagaoka, Japan), Y.Aikawa, M.Sugigara.

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.366-70 (8 April 1983).

The donor-like surface states at the TiO₂/H₂O interface were detected by measuring the capacitance under UV illumination. The surface states were located 0.65 eV below the bottom of the conduction band of TiO₂. The density of surface states was increased by increasing the light intensity. The surface states were observed under UV illumination but disappeared in the dark. (20 refs.)

62492 Characterization of the interface energetics for N-type cadmium selenide/nonaqueous electrolyte junctions. A.Aruchamy, J.A.Bruce, S.Tanaka, M.S.Wrighton (Dept. of Chem., MIT, Cambridge, MA, USA).

J. Electrochem. Soc. (USA), vol.130, no.2, p.359-64 (Feb. 1983). Single crystal, n-type CdSe photoanodes have been studied in 0.1M [n-Bu₄N][ClO₄]/CH₃CN solutions containing low concentrations of fast, outer-sphere one electron redox reagents. A number of redox couples were studied spanning a wide range of redox potentials, E° . The authors find that reversible electrochemical response is seen at both dark and illuminated (632.8 nm light) n-CdSe for couples with E° more negative than -1.2 V vs. SCE, e.g. Ru(bpy)₃²⁺/Ru(bpy)₃³⁺. For couples with E° positive of -1.2 V vs. SCE the authors find that CdSe is blocking to the oxidation of the reduced form of the redox couple in the dark, but illumination results in its oxidation. The photoanodic current peak in a cyclic voltammogram occurs more negative than at a Pt electrode, the difference between these values is the photovoltage, E_{ph} , taken to approximate the barrier height, E_b . The effect of a number of different etches on the interface energetics of CdSe was investigated, since it was previously determined that an oxidizing or reducing etch would yield quite different results for n-CdTe. For CdSe, however, the different etches do not give significantly different results with respect to E_b vs. E° , despite large variation in surface composition deduced from Auger and XPS spectra. (19 refs.)

62493 Semiconductor electrodes. XLVII. AC impedance technique for evaluating surface state properties of n-MoTe₂ in acetonitrile solutions containing various redox couples. G.Nagasubramanian, B.L.Wheeler, G.A.Hope, A.J.Bard (Dept. of Chem., Univ. of Texas, Austin, TX, USA). *J. Electrochem. Soc. (USA)*, vol.130, no.2, p.385-91 (Feb. 1983). Measurement of the in-phase (0°) and quadrature (90°) components of a small (12 mV) AC signal at frequencies of 1-5000 Hz imposed on the DC potential allows the determination of the AC equivalent circuit. Study of the AC impedance as a function of potential and frequency permits the determination of the properties of the semiconductor/solution interface. Results of measurements on n-MoTe₂ in MeCN containing various redox couples spanning a wide range of redox potentials are reported. The advantages of the in-phase (0°) component for extracting properties of surface states are discussed. In the region 0.3-0.5 V negative of the valence bandedge, the total surface-state density is ca. 10¹⁵ cm⁻². The adsorption in the I⁻/I₃ system on the n-MoTe₂ surface in aqueous and acetonitrile solvents are compared. (32 refs.)

62494 Open-circuit photopotentials at doped α -Fe₂O₃ electrodes in aqueous solution. R.Shinar, J.H.Kennedy (Dept. of Chem., Univ. of California, Santa Barbara, CA, USA). *J. Electrochem. Soc. (USA)*, vol.130, no.2, p.392-6 (Feb. 1983). The influence of redox couples in aqueous solution on the interface energetics of chemically and thermally doped polycrystalline α -Fe₂O₃ photoanodes has been investigated. Experiments were carried out at several pH values. Results are compared to those obtained from a single crystal electrode. It is shown that the potential of the semiconductor under illumination shifts toward positive values when the energy level of the redox couple in solution is increased. The role that grain boundaries in the sintered electrodes may play, the effect of pH and the redox couple concentration are discussed. (16 refs.)

62495 Specific contact resistance of metal-semiconductor ohmic contact. Chen Cunli (Dept. of Phys., Nanjing Univ., China). *Chin. J. Semicond. (China)*, vol.4, no.2, p.191-3 (March 1983). In Chinese. The measurement of the specific contact resistance of M-S ohmic contact is presented using a four-point configuration circular transmission line model. This method eliminates the necessity for the mesa isolation of contact pattern, thus simplifying the sample preparation and calculation. The experimental result is in agreement with the in-line geometry transmission line model. (2 refs.)

62496 Ohmic contact properties of magnesium evaporated onto undoped and P-doped α -Si:H. H.Matsuura, T.Okuno, H.Okushi, S.Yamasaki, A.Matsuda, N.Hata, H.Oheda, K.Tanaka (Electrotech. Lab., Ibaraki, Japan). *Jpn. J. Appl. Phys. Part 2 (Japan)*, vol.22, no.3, p.L197-9 (March 1983). The authors have investigated the current-voltage characteristics of metal/undoped α -Si:H/ n^+ (or p^+) α -Si structures using Mg, Au, Pt, and Al. It has been indicated that the energy band of undoped α -Si:H shows a downward bending against Mg, being analogous to n^+ α -Si:H/undoped α -Si:H contact, while the band shows an upward bending against Au, Pt and Al. Mg/undoped α -Si:H contact is found to allow injection of electrons into the conduction band of α -Si:H, providing a good ohmic contact property. This contact does not exhibit the thermal-degradation at least up to 100°C. (9 refs.)

62497 Effect of heat treatment on the forward current-voltage characteristic of Au-nGaP surface-barrier structures. Yu.A.Gol'dberg, T.A.Laperashvili, G.A.Nakashidze, B.V.Tsarenkov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.375-6 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.866-9 (July 1982). [received: April 1983] The authors use results of a study of the effect of heat treatment on the forward current-voltage characteristic to propose a method for developing surface-barrier structures which do not contain an intermediate dielectric layer and which have a forward current-voltage characteristic which corresponds to the ideal Bethe model of thermionic emission. (6 refs.)

62498 Interface states induced in silicon by tungsten as a result of reactive ion beam etching. G.Gildenblat, B.A.Heath, W.Katz (Corporate Res. & Dev., General Electric Co., Schenectady, NY, USA). *J. Appl. Phys. (USA)*, vol.54, no.4, p.1855-9 (April 1983). Interface states induced in silicon by reactive ion beam etching (RIBE) have been investigated using a metal oxide semiconductor capacitance-voltage (MOS-CV) technique, secondary ion mass spectrometry (SIMS), and Rutherford backscattering spectrometry (RBS). RIBE using an ion beam extracted from a C₂F₆ plasma was used to selectively remove a layer of SiO₂ from the surface of single crystal silicon. MOS capacitors formed after the regrowth of a thin SiO₂ layer on the silicon showed the presence of a substantial interface state density ($N_{\text{ss}} = 10^{12}$ - 10^{13} eV⁻¹ cm⁻²) near the middle of the energy gap of Si. RBS experiments on the Si surfaces exposed to the reactive ion beam showed the presence of tungsten (presumably from the tungsten filaments used to ignite the plasma and neutralize the ion beam). SIMS depth profiles of these samples after reoxidation to form capacitors showed tungsten contamination which was at a maximum at the SiO₂-Si interface. The interface state density determined from CV measurements scaled linearly with the tungsten concentration at the interface as determined by SIMS. Interface states were formed only in the case where the Si surface was exposed to the reactive ion beam. As little as 10 nm of SiO₂ remaining on the Si surface after RIBE was sufficient to prevent interface states formation. (16 refs.)

62499 A model of conduction in inhomogeneous degenerate semiconductors: Application to silicon-on-sapphire films. J.L.Robert, J.M.Dusseau, P.Girard, J.Sicart (Centre d'Etudes d'Electroniques des Solides, Univ. des Sci. et Tech. du Languedoc, Montpellier, France). *J. Appl. Phys. (USA)*, vol.54, no.4, p.1903-8 (April 1983).

The electrical properties of silicon-on-sapphire films were investigated between 4.2 and 300K. The experimental results can be explained by considering the conduction process exclusively in the transition layer of the Si-Al₂O₃ interface. The properties of silicon-on-sapphire are interpreted in this study by means of a model in which long range fluctuations in potential occur, caused by the existence of inhomogeneities or local defects in the films. 62500 Determination of the efficiency of electron capture center parameters in the MOS structure dielectric layer. N.I.Gavrulin, G.N.Demidova, E.N.Zhuravlev.

Meas. Tech. (USA), vol.25, no.7, p.618-20 (July 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.7, p.58-60 (July 1982). [received: Feb. 1983] Deep-seated electron capture centers in the dielectric layer of MOS (metal-oxide-semiconductor) structures of the Al-SiO₂-Si type contribute to the formation of a negative space charge on the oxide when electrons are injected. Such a charge impairs the stability of operating characteristics of MOS devices by changing their threshold voltage, varying the slope of the transfer characteristic of transistors, etc. The theoretical principles of determining the effective electron capture cross section in traps and the effective trap density which can be used for the evaluation of the parameters of charge-carrier capture centers are outlined and an experimental method which enables determination of these parameters is described. Some experimental results for p-type MOS structures are presented. (7 refs.)

62501 Influence of structure defects on the characteristics of warm electrons and holes near the surface of silicon. E.M.Lapidus, E.A.Vygovskaya, A.A.Galaev, P.T.Mustaev (Inst. of Steel & Alloys, Moscow, USSR). *Sov. Phys.-Semicond. (USA)*, vol.16, no.10, p.1232-3 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1909-11 (Oct. 1982). [received: April 1983]

One of the electrophysical parameters most sensitive to the nature of the scattering mechanism predominating in a given semiconductor is the coefficient β in the dependence of the mobility of warm carriers $\mu = \mu_0(1 + \beta E^2)$ on the intensity of a longitudinal field E. In the surface layers of a semiconductor the relationship between the sign of β and the nature of the scattering process can change because of the two-dimensional nature of carrier transport in a narrow potential well. The authors carry out a comparative investigation of the characteristics of warm carriers in MIS structures made of silicon and characterized by different defect densities, and analyze the relationship between the sign of β and the nature of the scattering mechanism in the surface layers of silicon. (7 refs.)

62502 Optimization of multilayer structure for electron-acoustic-surface-wave correlators. V.G.Kadenskii, S.S.Karinskii, V.V.Kryachko. *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.379-80 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.874-8 (July 1982). [received: April 1983]

The authors derived expressions for the potentials of electron-acoustic surface waves at local points on the surface of a metal-insulator-semiconductor structure away from the interdigital transducers, and use the results to calculate the recording efficiency. (3 refs.)

62503 Electrical conduction phenomena and negative resistance in Al-Al₂O₃-Au structure. Bong-Heup Kim, Chang-Hi Hong (Korean Inst. Electrical Engrs., Seoul, Korea). *Trans. Korean Inst. Electr. Eng.*, vol.31, no.10, p.101-8 (1982). In Korean.

It is possible to confirm the diffusion effect of Au⁺ ions from an Au anode to the bulk of the thin insulation layer by observing voltage vs current characteristics of the MIM device. The inherent nature of the forming process is not yet clearly disclosed though, at least, the process locally accompanies structural modification in the dielectric layer such as a strongly disordered porous region containing a large number of several kinds of defects. O₂ vacancies and Au⁺ impurities act as localised energy states inside the forbidden band of Al₂O₃. The observed easy conduction mechanism at low voltage may originate in tunneling or hopping of electrons through the series of such localised energy states of the insulator. (17 refs.)

62504 Negative differential resistance in multilayer metal-barrier-metal tunneling structures. E.M.Belenov, I.N.Kompanets, Yu.M.Popov, I.A.Poluektov, S.I.Sagitov, E.M.Soboleva, A.G.Sobolev, A.V.Uskov, V.G.Tsukanov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.422-3 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.978-81 (Aug. 1982). [received: April 1983]

Studies of a metal-barrier-semiconductor-barrier-semiconductor-barrier-metal structure (MBSBSBM). Since the effective mass of the electrons in the semiconductor used in this experiment (In_{0.5}O₃) is 10-20 times smaller than that in a metal, the size quantization of the energy in the conduction band of the semiconductor is seen more clearly than it would be in a metal film. Furthermore, it turns out to be possible to significantly reduce the thickness of the insulating layers (barriers) which separate the semiconducting films from each other. The effective barrier B has a complicated shape, so that a region with a negative differential resistance, small in magnitude, can be produced. It may thus be expected that the structure proposed will prove useful for developing sources and amplifiers of electromagnetic radiation with a continuously tunable frequency over the range 10¹²-10¹⁵ Hz. The small dimensions of these structures and their adaptability to mass production make them promising for use in integrated circuits. (5 refs.)

73.60D Metallic thin films

62505 Resistivity and temperature coefficient of resistance of chromium-copper alloy films. A.R.Patel, G.K.Shivakumar (Dept. of Phys., Sardar Patel Univ., Gujarat, India), N.C.Pandya, N.C.Chourasia.

J. Mater. Sci. (GB), vol.18, no.4, p.1028-30 (April 1983). Measurements of electrical resistivity and the temperature coefficient of resistance of vacuum deposited chromium-copper alloy films are reported. The mean free path of the conduction electrons calculated from resistivity data and TCR data is 37.6 and 36.6 nm, respectively. The resistivity and TCR of an infinitely thin film have been computed to be $3.83 \mu\Omega\text{cm}$ and $2.886 \times 10^{-6} \text{ } ^\circ\text{C}^{-1}$, respectively. The experimental data can be satisfactorily explained on the basis of Fuchs-Sondheimer theory assuming a total diffuse scattering. (8 refs.)

62506 On the theory of the spontaneous Hall effect in ferromagnetic films. E.M.Kogan, V.V.Ustinov, E.A.Turov (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.2, p.961-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The spontaneous Hall coefficient (SHC) of metallic ferromagnetic film is calculated. It is shown that the difference between the SHC of film and that of bulk ferromagnetic is caused by the inhomogeneous distribution of the current across the film and the asymmetric scattering of the conduction electrons on the surface defects. (9 refs.)

62507 Magnetoresistance and Hall effect in amorphous CoZr films. T.Yamagata, S.Ito (Microelectronics Res. Labs., Nippon Electric Co. Ltd., Kawasaki, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1475-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Transport properties for RF sputtered amorphous $\text{Co}_{1-x}\text{Zr}_x$ ($0.05 < x < 0.28$) films have been investigated. It was found that anisotropic magnetoresistance is negative above $x=0.13$, unlike in most 3d alloys. Spontaneous Hall coefficient increased linearly with Zr content and was dominated by the side-jump contribution. (5 refs.)

62508 Resistance change of thin Permalloy films caused by applied stress and its application to strain measurements. S.Shinzato (Faculty of Education, Ryukyuu Univ., Okinawa, Japan), K.Kuwahara.

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.77-9 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The strain sensitivity of resistance is studied for thin 76Ni-24Fe films having a magnetic uniaxial anisotropy. It is found that a higher strain sensitivity and lower thermal coefficient of resistance than those of the usual strain gauges can be obtained at strains below 2×10^{-4} . (5 refs.)

62509 Composition and temperature dependence of resistivity in amorphous Gd-Co films. H.Okuno, Y.Sakurai (Dept. of Control Engng., Osaka Univ., Osaka, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.80-2 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The composition and temperature dependence of electrical resistivity were studied for a series of amorphous Gd-Co films prepared by an RF-sputtering method. With increasing Gd concentration the electrical resistivity at 4.2K increased from $180 \mu\Omega\text{cm}$ to $350 \mu\Omega\text{cm}$ and the temperature coefficient of resistivity at 288K decreased and became negative above $220 \mu\Omega\text{cm}$. (15 refs.)

62510 Bias voltage effect on electrical resistivity of GdCo amorphous sputtered films. S.Honda, M.Ohkoshi, T.Kusuda (Dept. of Electronics, Hiroshima Univ., Higashi-Hiroshima, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.238-40 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The temperature dependence of electrical resistivity ρ and both the effects of annealing and oxidation on the ρ -values have been investigated in GdCo films sputtered under various substrate bias voltages. It has been found that the oxidized films or the high biased films are unstable crystallographically. (8 refs.)

62511 Electrical properties of 70 wt.%Cr-30 wt.%SiO thin films. M.Milosavljevic, T.M.Nenadovic, N.Bibic, T.Dimitrijevic (Boris Kidric Inst. of Nuclear Sci., Belgrade, Yugoslavia).

Thin Solid Films (Switzerland), vol.101, no.2, p.167-78 (11 March 1983). The electrical and structural properties of flash-evaporated 70 wt.%Cr-30 wt.%SiO cermet films were investigated. It was found that the electrical properties depend on the deposition conditions, thickness of the films, substrate roughness and post-deposition thermal treatment. Structural investigations were made in order to find the causes of variations in the electrical properties of films deposited and thermally treated in different conditions.

The films were produced in the dielectric structural regime, with concentrations of chromium equal to or less than 40 vol.%. The temperature coefficient of resistance varied from -30 to $-200 \text{ ppm } ^\circ\text{C}^{-1}$ and the sheet resistivity varied from 200 to $1400 \Omega/\square$. The concentration and distribution of chromium, which vary with the deposition conditions, have the strongest influence on the electrical properties of the thin films. (12 refs.)

62512 Electrical properties of island aluminium films evaporated onto an NaCl substrate. E.Dobierzewska-Mozrzycka, P.Bieganski, A.Radosz (Inst. Fizyki, Politech. Wroclawska, Wroclaw, Poland), A.Bochenek.

Thin Solid Films (Switzerland), vol.102, no.1, p.77-86 (8 April 1983). Aluminium films with an island structure were evaporated onto an NaCl substrate under conditions of ultrahigh vacuum (10^{-9} Torr) and their electrical properties were examined. The temperature dependence of the film resistance in the range 100-400 $^\circ\text{C}$ was measured in vacuum in situ. Ohmic characteristics of the films were plotted for selected temperatures. The microstructure and crystallographic orientation were determined. (24 refs.)

62513 Ag_2Se thin film conductivity with a selenium excess. J.-C.Bernede, B.El Bouchairi (Univ. de Nantes, Nantes, France).

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.3, p.173-6 (24 Jan. 1983). In French.

Experimental results have shown that an excess of selenium (1 to 5%) in Ag_2Se thin films changes the properties of the β low temperature phase. There is a new transition temperature: below this temperature the film is metallic-like, above this temperature the film behaves as a semiconductor. The new metallic-like behaviour is explained by the disorder tied to the mixing of two crystalline structures. The new transition occurs when these crystalline structures give one single new structure. (4 refs.)

62514 Electrical properties of SnO_2 polycrystalline thin films and single crystals exposed to O_2 - and H_2 -gases. T.Yamazaki, U.Mizutani, Y.Iwama (Dept. of Crystalline Materials Sci., Nagoya Univ., Nagoya, Japan).

Jpn. J. Appl. Phys. Part I (Japan), vol.22, no.3, p.454-9 (March 1983).

The electrical conductivity σ and carrier density n have been measured in the range 77-670K for the SnO_2 single crystal and thin films prepared by the vapour deposition technique. It is found that the SnO_2 thin film possesses a carrier density of 10^{19} cm^{-3} , three orders of magnitude larger than that in the as-grown SnO_2 single crystal, and exhibits electrical properties characteristic of a degenerate semiconductor. Both single crystals and thin films undergo irreversible changes in electrical properties upon heat treatment in vacuum or exposure to O_2 - or H_2 -gases. This occurs as a result of reduction and oxidation of SnO_2 . However, the oxidation and reduction proceed in thin films at much lower temperatures than in single crystals. The unique gas-sensing character of thin films was interpreted by assuming that the oxidation and reduction preferentially proceed along the grain boundaries in the thin film. (16 refs.)

62515 Effects of weak electron localization in thin GaAs films. A.K.Savchenko, V.N.Luts'kii, V.I.Sergeev (Inst. of Radio Electronics, Acad. of Sci., Moscow, USSR).

JETP Lett. (USA), vol.36, no.5, p.185-8 (5 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.5, p.150-2 (5 Sept. 1982). [received: April 1983]

Negative magnetoresistance of GaAs films, which is interpreted on the basis of the theory of localization, is observed. The temperature dependences of the resistance and magnetoresistance are measured; the values of parameters entering into the theory are determined. (5 refs.)

62516 Influence of spontaneous polarization of TGS crystals on the electrical properties of ZnTe thin films. E.Sniadek, W.Gordon (Inst. of Phys., Tech. Univ. of Poznan, Poznan, Poland).

Mater. Sci. (Poland), vol.7, no.4, p.447-51 (1981).

The field effect and electrical resistivity of zinc telluride (ZnTe) thin films evaporated on (010) ferroelectric crystal surface of triglycine sulphate (TGS) were investigated in the range 297-350K to determine the influence of the spontaneous polarization of TGS crystals on changes in electrical resistivity of ZnTe thin films. The relationship $\Delta R(2P)$ in the temperature range 297-315K was found to be linear showing that the change in electrical resistivity of ZnTe thin films in the temperature region investigated is due solely to the spontaneous polarization of TGS. (14 refs.)

62517 Electrical properties of SnTe epitaxial films on mica substrate. S.Santhanam, A.K.Chaudhuri (Dept. of Phys., Indian Inst. of Technol., Kharagpur, India).

Physica B & C (Netherlands), vol.115 B+C, no.2, p.156-60 (Jan. 1983).

Epitaxial films of SnTe were grown on heated mica substrates (448K) and their galvanomagnetic properties were studied between 160 and 300K. The carrier concentration and the mobility for different thicknesses of the films are explained by means of a two valence band model. The mobility values calculated for heavy holes agree well with the experimental values whereas the calculated mobility values of light holes show a peculiar behaviour which cannot be explained if the band is assumed to be parabolic. (27 refs.)

62518 Thermoelectric properties of thin polycrystalline films. B.Ya.Balagurov.

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1204-5 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1870-2 (Oct. 1982). [received: April 1983]

62519 Electron trapping in thin films of thermal SiO₂ at temperatures between 30 and 300K. M.Itsumi (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan). *J. Appl. Phys. (USA)*, vol.54, no.4, p.1930-6 (April 1983). Temperature dependence of electron trapping in thermally grown SiO₂ has been studied using metal-silicon dioxide-silicon (MOS) structures. The MOS samples are charged using avalanche injection from the Si substrate at temperatures between 30 and 300K. It is found that the rate of electron trapping increases monotonically as temperature decreases from 300 to 30K for both oxides subjected to H₂/N₂ annealing and oxides subjected to no H₂/N₂ annealing. The majority of electrons trapped at 77K is thermally reemitted, as the samples are warmed to room temperature. Analyses of the experimental results indicate that neutral trap centers responsible for electron trapping are characterized by the two discrete energies of 23 and 4 meV below the conduction band edge of SiO₂. (30 refs.)

62520 Characteristics of magneto-resistive films controlled by grating surface of substrate. N.Nomura, N.Kaminaka (Materials Res. Lab., Matsushita Electric Co. Ltd., Osaka, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.83-5 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Uniaxial magnetic anisotropy of a vacuum deposited magneto-resistive (MR) Al₂O₃ element is found to be induced by ruled surface roughness of a grated substrate, and a magnetostatic interpretation for the anisotropy is given. The response of MR element biased by grating-induced anisotropy shows excellent linearity without hysteresis. (5 refs.)

62521 Electronic properties of doped amorphous SiO_x. E.Holzenkammer, J.Stuke, R.Fischer (Fachbereich Phys., Univ. Marburg, Marburg, Germany). Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.778-82. Films of a-SiO_xH (0 ≤ x ≤ 1) were prepared in a glow discharge of SiH₄-N₂O-mixtures. It is found that the band gap widens at a rate dE_g/dx = 1 eV. For fixed oxygen content, the band gap shrinks upon doping. This effect sets in at about 10¹⁹ ppm B; on the P side this effect is much weaker. For x = 0.23, the maximum values for the dark conductivity are ≈ 3.10⁻⁵ Ω⁻¹ cm⁻¹ (B-doping) and ≈ 10⁻⁶ Ω⁻¹ cm⁻¹ (P-doping). (6 refs.)

74.00 SUPERCONDUCTIVITY

74.10 OCCURRENCE, CRITICAL TEMPERATURE

62522 Electron-phonon coupling constant and critical temperature of binary and ternary superconducting alloys of Mo, Nb, Ta and V. P.Chatterjee (Dept. of General Phys. & X-rays, Indian Association for the Cultivation of Sci., Jadavpur, Calcutta, India). *Indian J. Cryog.*, vol.7, no.3, p.130-4 (1982). The modified version of the theory of Gaspari and Gyorffy (1972) for calculating the electron-phonon coupling constants, λ, for binary substitutional alloys has been used together with Allen and Dynes' expression (1975) for the superconducting transition temperature, T_c, to obtain λ and T_c for the superconducting alloys: NbTa, NbV, VMo and TaMo. The theory has been further extended via the average t-matrix approximation (ATA) to calculate λ and T_c for the ternary alloy: NbTaMo, having the same BCC structure as its components. The results agree favourably with experiments for NbTa, NbV and VMo. For TaMo and NbTaMo, for which experiments on T_c are yet to be performed, the authors predict that these are fairly good superconductors. (7 refs.)

62523 Some observations on the superconductivity of TaS₂ intercalated by pyridine. K.A.Kini (Central Fuel Res. Inst., Dhanbad, India). *Indian J. Cryog.*, vol.7, no.3, p.153 (1982). Intercalation of compounds of the type NbS₂, TaSe₂, and PdTe₂, by nitrogenous bases such as pyridine, and consequent exhibition of elevation of critical temperature of superconductivity, is a well-known phenomenon. However, this phenomenon does not seem to have been explained satisfactorily. The author offers some brief observations in order to explain the increase in critical temperature of TaS₂ intercalated by pyridine. (2 refs.)

62524 Observation of vortex structures near a resistive transition in granular aluminum films. V.Yu.Tarenkov, A.I.D'yachenko, V.V.Stupakov (Physicotech. 74.20 THEORY

62525 On an approximate form of the coupled equations of the order parameter with the weak electromagnetic field for the ideal superconductor. Su Zhao-bin, Chou Kuang-chao (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China).

Commun. Theor. Phys. (China), vol.1, no.6, p.669-79 (1982). A simplified derivation of the macroscopic electrodynamic equations of Umezawa, Mancini et al. (1974) for superconductors is given in the framework of the closed time path Green's functions (CTPGF) using generalized Ward-Takahashi identities. It is shown that the forms of the equations obtained are the same for both thermoequilibrium and nonequilibrium stationary states provided the electromagnetic field is weak and its effect on the modulus of the order parameter can be neglected. The statistical behavior of the states is completely specified in the equations by parameters which can be calculated by the method of CTPGF. (9 refs.)

62526 The London equations for superconductors in a gravitational field. D.K.Ross (Dept. of Phys., Iowa State Univ., Ames, IA, USA).

J. Phys. A (GB), vol.16, no.6, p.1331-5 (21 April 1983). The author derives the modified London equations for a superconductor in a gravitational field, writes these equations in an elegant covariant form, and shows that these equations are consistent with the modified fluxoid quantisation condition in a gravitational field found by DeWitt (1966). (12 refs.)

Electron-phonon coupling constant and critical temperature of binary and ternary superconducting alloys of Mo, Nb, Ta and V See Entry 62522

74.30 GENERAL PROPERTIES

74.30C Magnetization curves, Meissner effect, penetration depth

62527 Meissner effect and magnetic field dependence of Cu clad Nb in mK region. Y.Oda, A.Sumiyama, H.Nagano (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.464-6 (March 1983). The Meissner region induced by the proximity effect in a thick Cu clad Nb wire is measured down to 4.5 mK. It is found that the thickness ρ of the Meissner region in Cu increases with decreasing temperature in proportion to T^{-1/2}. The magnetic field dependence of ρ is also studied in this temperature region. It is found that ρ decreases in proportion to ln H except for the very low field region, if ρ is sufficiently smaller than the thickness of Cu. An if ρ becomes comparable to the thickness of Cu, an anomalous behaviour is observed.

74.30G Response to electromagnetic fields, nuclear magnetic resonance, ultrasonic attenuation

62528 X-ray diffraction and EPR studies of NbGe high T_c films. S.N.Ekbote, S.K.Gupta, K.C.Nagpal, A.V.Narlikar (Nat. Phys. Lab., New Delhi, India).

Indian J. Cryog., vol.7, no.3, p.140-2 (1982). The EPR and X-ray diffraction studies were carried out on superconducting Nb₃Ge films. These films were prepared by DC sputtering in argon and oxygen atmospheres and their T_c ranges from 8K to 22.65K. The EPR spectra were systematically studied from ambient to liquid air temperature. However, this study failed to reveal any form of oxygen present in these films though some other EPR signals were recorded. The X-ray study could not detect the formation of any oxide phase. These results suggest that oxygen is mainly behaving as a stabilizer for forming the A-15 Nb₃Ge phase, in agreement with other workers. (5 refs.)

62529 Energy gap in superconducting lead by ultrasonic technique. S.Sathish (Regional Coll. of Education Mysore, Mysore, India), B.K.Basu.

Indian J. Cryog., vol.7, no.3, p.150-2 (1982). Describes an experimental arrangement for the measurement of the energy gap in superconducting lead by an ultrasonic technique. The ultrasonic attenuation is measured in the normal and superconducting states by the usual pulse echo technique. The temperatures below 4.2K were attained by pumping liquid helium and temperatures above 4.2K were attained by varying the amount of exchange gas in the experimental chamber. The temperature stability above 4.2K is discussed and a brief outline of the cryostat is given. Some preliminary results on the energy gap are presented. (3 refs.)

74.40 FLUCTUATIONS AND CRITICAL EFFECTS

62530 Fluctuation enhanced electrical conductivity of Ge-covered superconducting films of tin. P.N.Dheer, R.S.Parashar (Dept. of Phys. & Astrophys., Univ. of Delhi, Delhi, India).

Indian J. Cryog., vol.7, no.3, p.147-9 (1982). Measurements of the fluctuation induced excess electrical conductivity, σ_f, above the superconducting transition temperature T_c, of thin films of tin with a protective covering of Ge have been carried out to investigate the effect of the superconducting-semiconductor interface on the thermodynamic fluctuations of the superconducting order parameter. The pair-breaking parameter δ, for covered films is found to be greater than that for the uncovered films. The experimental results also suggest that δ increases exponentially with the normal state sheet resistance of Ge-covered films. (10 refs.)

74.50 PROXIMITY EFFECTS, TUNNELLING PHENOMENA, AND JOSEPHSON EFFECT

62531 Fabrication of the weak-link Josephson junction on a microstep. G.Uehara, M.Nakanishi, K.Hara (Dept. of Math. Engng. & Instrumentation Phys., Univ. of Tokyo, Tokyo, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.544 (March 1983). Theoretically, a weak-link type junction gives an ideal Josephson effect when the dimension of the weak-link is comparable with the coherence length ξ. Some workers have tried to fabricate weak-links along this line have succeeded to an extent. But in each of the above cases, the fabrication process is rather complicated or submicrometer patterning was essential. The authors report a new fabrication process, which is simple and does not need submicrometer patterning technology. (8 refs.)

 The structure of the mixed state of a current-carrying thin film of ideal type II superconductors in longitudinal magnetic field H_z is analysed. It is shown that the lossless current flow through the films in the mixed state is possible only if H_z is larger than $H_{c1}(d)$. The curves of longitudinal critical current obtained have complex structures and show the peak effect in general. The main features of the theoretical I_c - H_z curve of the films with thickness d larger than 5λ are identical with those observed by Heaton and Rose-Innes in $Nb_{55}Ta_{45}$ alloys. (16 refs.)

- 62533 Cooperative quadrupolar ordering of Yb^{3+} ions in the Γ_8 electronic state. F.Hartmann-Boutron (Spectrometrie Phys., Univ. Sci. et Médicale Grenoble, Grenoble, France). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1079-80 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
 In connection with experiments on $YbCo_2$ the authors investigate theoretically the quadrupolar ordering of Yb^{3+} ions whose lowest electronic state is a Γ_8 quadruplet. Previous studies (devoted to $S=3/2$ or to Γ) assumed that only one component of the quadrupole was nonzero, but allowed for magnetic ordering. The present work is limited to pure quadrupolar ordering but all five components of the quadrupole are assumed to be nonzero. The authors

find two infinite families of degenerate solutions; the physical implications of these degeneracies are examined. (6 refs.)

- 62534 A singlet-singlet model for amorphous alloys with praseodymium. A.K.Bhattacharjee, B.Coqblin (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1575-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
 A singlet-singlet model for induced magnetism in amorphous systems is developed by assuming a random distribution of the energy splitting over the rare-earth sites and the induced ordering is computed for both the ferromagnetic and the antiferromagnetic cases. The results agree with experiments on amorphous $Pr_{x}La_{30-x}Au_{20}$ alloys. (5 refs.)

75.10H Ising and other classical spin models

- 62535 The condensation of spin-1/2 lattice bosons. P.Fazekas (Inst. für Theoretische Phys., Univ. zu Köln, Köln, Germany), P.Entel. *Z. Phys. B (Germany)*, vol.50, no.3, p.231-8 (1983).
 The authors study the effect of an antiferromagnetic, Ising-like boson-boson interaction on the formation and structure of the Bose-condensed phases of a spin-1/2 Bose lattice gas. Their model is similar to those used in the description of spin-aligned atomic hydrogen. A mean-field treatment gives two Bose-condensed phases: one without, and one with a transverse component of the magnetisation. For a range of interaction strength, the system condenses first into a symmetrical state and, at a lower temperature, the condensate breaks the symmetry of the interaction with the appearance of transverse magnetisation. (17 refs.)
 62536 Multi-soliton solutions for a classical ferromagnetic chain. Pu Fuchou, Zhou Xin, Li Bozang (Inst. of Phys., Acad. of Sinica, Beijing, China). *Commun. Theor. Phys. (China)*, vol.2, no.1, p.797-802 (1983).
 The authors report the multisoliton solutions of the Landau-Lifshitz equation for a classical ferromagnetic chain and their asymptotic behaviors as well as the formulae for the shifts at their phases and centers of mass. They include the single- and double-soliton solutions as particular cases. (9 refs.)
 62537 Degenerate helimagnetic states, lines of soft modes and absence of long-range order in three dimensions. E.Rastelli, L.Reatto, A.Tassi (Istituto di Fisica, Univ. di Parma, Parma, Italy). *J. Phys. C (GB)*, vol.16, no.11, p.L331-5 (20 April 1983).
 The triangular and hexagonal classical Heisenberg model with suitable competing intraplane interactions have infinitely many ground states having inequivalent helical order of different pitch Q . The spin wave energy vanishes along a line in k space, the locus of the Q vectors. Helimagnetic long-range order is destroyed at finite temperature also in three dimensions. The existence of a new phase is suggested: an isotropic helimagnet that leads to a characteristic ring scattering. The effect of quantum corrections and of easy plane anisotropy is also considered. (8 refs.)
 62538 Two-dimensionally modulated phase in Ising models. Y.Saito (Inst. für Festkörperforschung, KFA Jülich, Jülich, Germany). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1049-51 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
 The possibility of an incommensurate phase with two-dimensional modulation is studied for spin 1/2 Ising models on a triangular lattice with antiferromagnetic nearest and next nearest neighbor interactions. A three dimensional system consisting of stacked triangular layers is also studied. (11 refs.)
 62539 One-dimensional decorated lattice: the $\nu \rightarrow \infty$ limit. L.L.Goncalves (Dept. de Fisica, Univ. Fortaleza, Fortaleza, Brazil), J.R.L.de Almeida. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1218-20 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
 It is shown that a one-dimensional model composed of Ising ($s=1/2$) and classical (ν -components) spin in the limit $\nu \rightarrow \infty$ can be mapped into the spherical model provided the exchange constant is suitably renormalized. By introducing a new technique the n -spin correlation functions are obtained and it is shown that the procedure can be applied to the model in arbitrary d -dimensional lattices. (5 refs.)
 62540 Transverse spin correlation function of the one-dimensional spin-1/2 XY model in a longitudinal magnetic field. T.Tonegawa (Dept. of Phys., Kobe Univ., Kobe, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1223-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
 The transverse spin correlation function and the transverse inverse correlation length of the one-dimensional spin-1/2 XY model in a longitudinal magnetic field are calculated exactly. It is shown that the longitudinal magnetic field has a marked effect on the transverse inverse correlation length at low temperatures. (4 refs.)
 62541 Modulated phases in diluted ANNNI models. T.Kawasaki (Phys. Dept., Coll. of Liberal Arts, Kyoto Univ., Kyoto, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1469-70 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
 Persistence of the modulated phases in an anisotropic Ising model with nearest- and next-nearest-neighbor interactions is examined in the diluted system, by using the high-temperature series expansion. There appears to be no remarkable difference from the pure system in the wider range of concentration. (6 refs.)
 62542 Reply to 'Comment on "Canonical-ensemble results for the Ising model with random bonds in two dimensions"'. J.F.Fernandez (Centro de Fisica, Inst. Venezolano Investigaciones Cientificas, Caracas, Venezuela). *Phys. Rev. B (USA)*, vol.27, no.7, p.4486-7 (1 April 1983).
 For original paper see *ibid.*, vol.25, p.417 (1982). In the previous Comment (reference unobtainable), Binder and Morgenstern use their previous result, $\langle S_i S_j \rangle^2 = c \exp(-r_{ij}/\xi)$ for small systems, plus their hypothesis that ξ and c depend weakly on L , to produce results strongly similar to what the author has obtained previously. They thus suggest that his results, contrary to his own conclusion, do not indicate the existence of a critical point in the Edwards-Anderson model in two dimensions. The author shows here that their claim is not well founded. (3 refs.)

75.20C Nonmetals

- 62545 Magnetochemical study of titanium dioxide doped with tantalum pentoxide. M.A.Kvantov, Yu.P.Kostikov, A.I.Leonov. *Inorg. Mater. (USA)*, vol.18, no.6, p.886-8 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1049-51 (June 1982). [received: Feb. 1983]
 The semiconducting properties of doped titanium dioxide may be explained by the appearance of trivalent titanium ions. The authors attempt to determine the physicochemical processes responsible for the appearance and stabilization of trivalent titanium in titanium dioxide when it is doped. X-ray diffraction investigations were performed. The temperature dependence of the magnetic susceptibility was measured by the Faraday method in the range 3-300K. ESCA and X-ray spectral microanalysis were used. (7 refs.)
 62546 On magnetic properties of some molybdenum oxides. H.Gruber (Inst. fur Festkorperphys., Tech. Univ. Graz, Graz, Austria), H.Haselmair, H.P.Fritzer. *J. Solid State Chem. (USA)*, vol.47, no.1, p.84-91 (15 March 1983). The temperature dependence of the magnetic susceptibility for the microcrystalline compounds MoO_3 , $\eta\text{-Mo}_2\text{O}_{11}$, $\gamma\text{-Mo}_2\text{O}_{11}$, Mo_7O_{27} , Mo_8O_{23} , Mo_9O_{26} , and $\text{Mo}_{10}\text{O}_{32}$, respectively, has been investigated between 77 and 550K at various external fields. The susceptibility increases slightly with temperature for all solids. At low temperatures the changes are more pronounced for $\eta\text{-Mo}_2\text{O}_{11}$, $\gamma\text{-Mo}_2\text{O}_{11}$, Mo_7O_{27} , and $\text{Mo}_{10}\text{O}_{32}$. The deviations from stoichiometry and the related changes in the concentration of charge carriers have a large influence on the values of the susceptibility. Furthermore, some indications of anisotropy were found. (19 refs.)
 62547 Investigation of the magnetic behaviour of the copper ions in some borate oxide glasses. Gh.Ilonca, I.Ardelean (Faculty of Phys., 'Babes-Bolyai' Univ., Cluj-Napoca, Rumania). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1427-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). Using X-ray analysis, electron microscope and magnetic susceptibility measurements some borate oxide glasses with different glass matrix modifiers (Pb, Li, K) have been studied together with various contents of CuO , prepared in the same conditions. The valence states and distribution mode of copper ions depend of the glass matrix modifiers. (5 refs.)

75.20E Metals and alloys

- 62548 Longitudinal and transverse fluctuations of the spin density in alpha manganese. P.J.Brown, K.R.A.Ziebeck (Inst. Laue-Langevin, Grenoble, France), J.G.Booth, H.Capellmann. *Z. Phys. B (Germany)*, vol.50, no.3, p.223-30 (1983). Polarised neutrons and polarisation analysis have been used to investigate the paramagnetic scattering from a powder sample of alpha manganese. A significant level of paramagnetic scattering was observed at all wave vectors with two peaks located at 1.25 and 2.0 \AA^{-1} . The anti-ferromagnetic spatial correlations giving rise to the observed peaks were found to persist beyond 5 T_N . Between 100 and 300K (i.e. up to 3 T_N) the paramagnetic scattering was found to increase with temperature for all wave vectors thus indicating an increase in the amplitude of the spin density. Above 3 T_N the scattering was found to decrease with increasing temperature. It is concluded that both transverse (angular) and longitudinal (amplitude) fluctuations of the spin density are important in defining the paramagnetic properties of alpha manganese. (26 refs.)

75.20H Local moment in dilute alloys; Kondo effect (see also 72.15Q Electronic conduction)

- 62549 Temperature-induced local moments in MnSi and FeSi. S.N.Evangelou, D.M.Edwards (Dept. of Maths., Imperial Coll., London, England). *J. Phys. C (GB)*, vol.16, no.11, p.2121-31 (20 April 1983). A unified theory is given of the magnetic and thermal properties of the itinerant-electron magnet MnSi and the non-magnetic semiconductor FeSi. The calculations are based on the spin-fluctuation theory of Hasegawa (1981) and employ a model density of states derived from an existing band calculation. The exchange parameter is determined to give the observed spontaneous moment in MnSi at $T=0$. The finite-temperature properties are then calculated without adjustable parameters and semi-quantitative agreement with experiment is obtained for the temperature dependence of the susceptibility of MnSi and for the unusual susceptibility and specific heat of FeSi. In both materials the root-mean-square atomic moment increases rapidly with increasing temperature to values of 1.0-1.5 μ_B . The associated fluctuating exchange fields destroy the band gap in FeSi which explains the similarity in the resistivity of FeSi and MnSi for $T>400\text{K}$. (33 refs.)
 62550 Thermodynamic properties of the Anderson model. A.Okiji, N.Kawakami (Dept. of Appl. Phys., Osaka Univ., Osaka, Japan). *Phys. Rev. Lett. (USA)*, vol.50, no.15, p.1157-9 (11 April 1983). The temperature dependence of the impurity susceptibility and specific heat for the Anderson model is investigated on the basis of the exact solution already obtained for this model. (16 refs.)

75.25 SPIN ARRANGEMENTS IN MAGNETICALLY ORDERED MATERIALS (NEUTRON STUDIES, ETC)

- 62552 Magnetic field-induced incommensurate magnetic phases in the singlet-ground state system CsFeCl_3 . W.Knop, M.Steiner, P.Day (Hahn-Meitner-Inst., Berlin, Germany). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1033-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). By means of elastic neutron scattering the authors have studied CsFeCl_3 in an external magnetic field. While at low fields no magnetic scattering can be observed in accordance with the nonmagnetic singlet ground-state of the Fe^{2+} in this system, the authors observe magnetic Bragg-peaks at $H>38$ kG. At this field H_1 reflections of the type $(\frac{1}{3}-\delta, \frac{1}{3}-\delta, 0)$ and $(\frac{1}{3}-\delta, \frac{1}{3}+\delta, 0)$ appear. At $H_2 \approx 39$ kG H_1 , a reflection of the type $(\frac{1}{3}-\delta, \frac{1}{3}-\delta, 0)$ appears, while the former disappear. Finally at $H_3 \approx 45$ kG the structure becomes commensurate characterized by the reflection $(\frac{1}{3}, \frac{1}{3}, 0)$. (6 refs.)
 62553 Magnetic structures and interaction constants in the two-dimensional Ising antiferromagnets $\text{RE}_2\text{O}_3\text{SO}_4$ (RE=Dy, Ho, Tb). H.G.Kahle, A.Kasten (Phys. Inst., Univ. Karlsruhe, Karlsruhe, Germany). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1081-3 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). The oxisulfates of Dy, Ho and Tb are nearly two-dimensional Ising antiferromagnets with the complexity of their magnetic structure increasing in this succession. By establishing the magnetic phase diagrams and by analyzing the spectroscopic data, the superexchange interaction to nearest, next and third nearest neighbours could be derived. (8 refs.)
 62554 Randomness in mixed antiferromagnets with competing spin anisotropies. J.M.Newsam, Y.Endoh, Y.Ishikawa (Dept. of Phys., Tohoku Univ., Sendai, Japan), H.Takei. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1463-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). The authors have studied the effect of randomness on the long range order in a mixture with competing spin anisotropies. The neutron diffuse scattering and the peak profile of the antiferromagnetic Bragg reflection from

$\text{Fe}_{0.65}\text{Co}_{0.35}\text{TiO}_3$ show marked temperature variations even at low temperatures well below T_N . (7 refs.)

62555 Frustration of antiferromagnetic bonds around a screw dislocation. T.Nakamura, K.Kawamura (Dept. of Materials Sci., Hiroshima Univ., Hiroshima, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1483-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

In simple cubic antiferromagnets which include a screw dislocation, the directions of two neighboring spins are not antiparallel and the order parameter is destroyed around the dislocation by the frustration. The specific heat does not jump at the Neel temperature T_N although the order parameter vanishes ultimately at T_N . (5 refs.)

62556 The interpretation with the spin-wave theory of the variation of the magnetization of iron and nickel as a function of the temperature and of the magnetic field. R.Pauthenot (CNRS, Grenoble, France).

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.1, p.29-32 (10 Jan. 1983). In French.

The variation of the spontaneous magnetization of iron and nickel as a function of the temperature and the variation of the isothermal magnetization as a function of the magnetic field were interpreted using the spin-wave theory. (13 refs.)

62557 Magnetic behaviour of spin-mixed iron(III) porphyrins. S.Mitra, V.R.Marathe, R.Birdy (Tata Inst. of Fundamental Res., Bombay, India).

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.103-7 (25 March 1983).

Detailed average magnetic susceptibility (295-4.2K) and average magnetisation (20-2K, 50-10 kOe) are reported for two novel spin-mixed iron(III) porphyrins, namely $\text{Fe}(\text{TPP})\text{ClO}_4$ and $\text{Fe}(\text{OEP})\text{ClO}_4$. The results confirm an $S=3/2$ ground state substantially spin-mixed with a low-lying $S=5/2$ state, but do not agree in detail with the crystal-field model of Maltempo (1974). (26 refs.)

62558 Magnetic properties of $\text{Fe}_x\text{V}_{3-x}\text{S}_4$ ($0 \leq x \leq 2$). H.Noza, H.Wada (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).

J. Solid State Chem. (USA), vol.47, no.1, p.69-80 (15 March 1983).

The magnetic susceptibility data of $\text{Fe}_x\text{V}_{3-x}\text{S}_4$ ($0 \leq x \leq 2$) are reported in the temperature range 4.2 to 1300K. The behaviour of the susceptibility at high temperatures changes significantly at the composition boundary $x=1.0$. The magnitude of the effective magnetic moment remains unchanged at $3.2 \mu_B$ in the composition range $x < 1.0$. It decreases with increasing iron content in the range $x > 1.0$, and rapidly decreases for x close to 2.0. The c lattice parameter varies in a manner analogous to the change in magnetic moment. These phenomena suggest that metallic bonding forms between metal layers and that it becomes stronger with increasing x . The susceptibility measurements at low temperatures show that $\text{Fe}_x\text{V}_{3-x}\text{S}_4$ is basically antiferromagnetic, although some of the $\text{Fe}_x\text{V}_{3-x}\text{S}_4$ compounds become weakly ferromagnetic after cooling in a magnetic field. The origin of the weak ferromagnetism is briefly discussed. (30 refs.)

62559 Spin wave theory of susceptibility of quadratic-layer antiferromagnet K_2MnF_4 . K.Tsuru, N.Uryu (Dept. of Appl. Sci., Kyushu Univ., Fukuoka, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1201-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The parallel and perpendicular susceptibilities, χ_{\parallel} and χ_{\perp} , of K_2MnF_4 are analyzed by the use of a renormalized spin-wave (RSW) theory. Good agreements with the experiments are obtained for both χ_{\parallel} and χ_{\perp} . (5 refs.)

62560 Quasielastic neutron scattering from the 1-D ferromagnet CsNiF_3 with an applied transverse field. K.Kakurai, M.Steiner (Hahn-Meitner-Inst. für Kernforschung GmbH, Berlin, Germany).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1215-17 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

By means of quasielastic neutron scattering the authors studied the magnetic field induced crossover in CsNiF_3 in the transverse magnetic field. The susceptibility at $q=0$ shows a broad maximum in its temperature dependence, which is best described by the static properties of the classical sine-Gordon chain. (10 refs.)

62561 Effects of external field on χ -T curve on cluster-glasses. M.Shiga, Y.Nakamura (Dept. of Metal Sci. & Technol., Kyoto Univ., Kyoto, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1411-12 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The temperature dependence of magnetic susceptibility of some cluster-glass alloys, $\text{Fe}_{0.5}(\text{Ni}_{0.7}\text{Mn}_{0.26})_{0.5}$, $\text{Fe}_{1-x}\text{Al}_x$ and $\text{Y}(\text{Mn}_{1-x}\text{Co}_x)_2$, have been measured in various external fields. In addition to the maximum point, T_m , in the χ -T curve, an inflection point, T_i , was observed below T_m . It has been shown that T_i decreases with increasing external field, H , following the empirical relation, $T_i(H) = T_i(0) - A\sqrt{H}$. (5 refs.)

62562 Frustration effects in the disordered system CsMnFeF_6 . L.Bevara, P.M.H.L.Tegelaar, A.J.van Duynveldt, M.Steiner (Studiecentrum voor Kernenergie, Mol, Belgium).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1447-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The magnetic properties of the highly frustrated system CsMnFeF_6 have been studied. At $T=300\text{K}$ clusters of canted antiferromagnet spins exist. Their resultant moments grow for decreasing T , whereas for $T \lesssim 80\text{K}$ these remain constant. At $T=26.3\text{K}$ the clusters freeze in and form domains in which their moments order ferromagnetically. Applying a magnetic field causes a splitting of the domains into microdomains. (4 refs.)

62563 A magnetic quasi-ordered state in $\text{Cr}_{1-x}\text{Ti}_x\text{S}$. S.Anzai, M.Nakada, S.Ohta, K.Tominaga, A.Fujii (Faculty of Sci. & Technol., Keio Univ., Yokohama-shi, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1467-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Magnetic susceptibilities of a solid solution $\text{Cr}_{1-x}\text{Ti}_x\text{S}$ ($0.10 \leq x \leq 0.60$) are investigated. The Neel temperature steeply decreases with increasing x and disappears at a low critical concentration ($0.20 < x < 0.25$). A spin glass-like phase exists beyond this concentration. The spin glass-paramagnetic transition temperature decreases with increasing x . (6 refs.)

62564 An AC magnetic susceptibility study of domain nucleation in an amorphous alloy. P.J.Back (Dept. of Phys., Univ. of New South Wales, Duntroon, Australia), S.J.Campbell.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1543-5 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The thermal nucleation of domains around the ordering temperature $T_c = (232.8 \pm 1.0)\text{K}$ of $\text{Fe}_{0.7}\text{Ni}_{0.3}\text{Cr}_{0.4}\text{P}_{0.3}\text{B}_0$ has been monitored by a variable temperature study (80-300K) of the AC magnetic susceptibility and its transient enhancement. This has delineated the susceptibility region free of domain effects for critical exponent analysis. (9 refs.)

62565 Magnetic moment of Fe-Ga-B amorphous alloys. K.Fukamichi, T.Sato, T.Masumoto (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1589-90 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

FeGaB and FeGeB amorphous ribbons were prepared by melt quenching. The magnetic properties of these alloys are explained by assuming a band structure of weak ferromagnetism. The crystallization temperature increases with increasing Ga and Ge content. (13 refs.)

62566 Magnetism of amorphous metal-metal alloys. A.P.Malozemoff, A.R.Williams, K.Terakura, V.L.Moruzzi, K.Fukamichi (IBM, Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.192-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

Reviews available experimental data on the magnetism of amorphous alloys of iron and cobalt with early transition metals $E=\text{La, Y, Hf, Zr, Ti, Ta, Nb, V, W}$ and Mo. Then the authors present parameter-free, self-consistent band calculations for related ordered compounds which elucidate the mechanism of moment formation and magnetic weakness. (67 refs.)

62567 Magnetic properties of the weak ferromagnet NH_4MnF_3 . J.Bartolome, R.Burriel, F.Palacio, D.Gonzalez (Departamento de Termologia, Univ. de Zaragoza, Zaragoza, Spain), R.Navarro, J.A.Rojo, L.J.De Jongh.

Physica B & C (Netherlands), vol.115 B+C, no.2, p.190-204 (Jan. 1983).

The magnetic properties of NH_4MnF_3 have been studied by means of heat capacity, AC susceptibility at zero field and at $H=10\text{ kOe}$ as a function of temperature, and at $T=4.2\text{K}$ as a function of field. Moreover, magnetization measurements were carried out at $T=4.2\text{K}$ as a function of field up to 20 kOe in a vibrating sample magnetometer and up to 400 kOe in a pulsed-field magnet. The compound has the simple cubic perovskite structure at room temperature. At $G_c=182.1 \pm 0.1\text{K}$ a structural transition to a pseudotetragonal symmetry occurs, which gives rise to a small change in the paramagnetic susceptibility. The onset of antiferromagnetic ordering takes place at $T_N=75.1 \pm 0.1\text{K}$ at zero field, and a spin-flip transition at $T=4.2\text{K}$ is detected at $H_{SF}=3.7 \pm 0.2\text{ kOe}$. Evidence for the presence of a small weak-ferromagnetic moment is found from an anomaly in χ and from the presence of magnetic absorption near T_N . From a comparison of the data to predictions for the SC Heisenberg antiferromagnetic model, a value of $J/k = -3.1\text{K}$ is obtained for the exchange interaction. (40 refs.)

62568 The spin-wave theory of the susceptibility of Heisenberg antiferromagnets: application to a quadratic layer antiferromagnet K_2MnF_4 and comparison with $(\text{C}_2\text{H}_5\text{NH}_3)_2\text{CuCl}_4$. K.Tsuru, N.Uryu (Dept. of Appl. Sci., Kyushu Univ., Fukuoka, Japan).

Physica B & C (Netherlands), vol.115 B+C, no.2, p.205-18 (Jan. 1983).

Low-temperature magnetic susceptibilities of the quasi-two-dimensional antiferromagnet K_2MnF_4 are reanalyzed by the use of renormalized spin-wave (RSW) theory. For the parallel susceptibility χ_{\parallel} , the formula is obtained as $\chi_{\parallel} \propto Q/(1+(1/2)dQ)$, where Q is a quantity which is essentially proportional to χ_{\parallel} given by the free spin-wave (FSW) approximation, and d and the anisotropy parameters. The second term in the denominator represents a contribution from the spin-wave interaction. A good agreement with the experimental data is obtained up to near T_N by using this formula. For the perpendicular susceptibility, the authors adopt the quadratic part with RSW energy $\epsilon_k(T)$ as unperturbed part of the Hamiltonian and the Zeeman term as the perturbation. The second order perturbation energy has been calculated using the canonical transformation which eliminates the terms of the first and third degree with respect to the Boson operators. Up to the terms of $O(1/S^2)$, the result agrees partially with that of Oguchi (1960). It is shown that the correction terms have a form of double summation with respect to wave numbers or fourfold integral and are not so small compared with the term of $O(1/S)$. Finally, the different situation of $(\text{C}_2\text{H}_5\text{NH}_3)_2\text{CuCl}_4$, a nearly two-dimensional ferromagnet with very weak interlayer antiferromagnetic coupling, is discussed in a comparative way with the case of K_2MnF_4 . - 62569 Static properties of classical ferromagnetic chains in a magnetic field: an interacting spin-wave theory. U. Balucani, M.G. Pini, V. Tognetti (Istituto de Elettronica Quantistica, CNR, Firenze, Italy), A. Rettori. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1229-30 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
- Longitudinal spin susceptibility, energy susceptibility and related properties of classical ferromagnetic chains in a field are calculated by means of an interacting spin-wave theory. The validity of the theory is checked by exact numerical calculations by the transfer matrix method and excellent agreement is found. (4 refs.)
- 62570 Effect of magnetic and nonmagnetic impurities on the soliton dynamics in $(\text{CD}_3)_4\text{NMnCl}_3$. H. Benner (Inst. fur Festkorperphys., Tech. Hochschule Darmstadt, Darmstadt, Germany), J.P. Boucher, J.P. Renard, H. Seitz. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1233-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
- From nuclear relaxation-time measurements, the authors obtain experimental evidence for magnetic solitons propagating diffusively along the chains of $(\text{CD}_3)_4\text{NMnCl}_3$ doped with copper or cadmium. The diffusion constant is hardly affected by impurity concentrations $0.2 \leq c \leq 0.8$ at.% but differs strongly for magnetic and nonmagnetic impurities. (5 refs.)
- 62571 Theoretical study of magnetic properties of pseudo-one-dimensional system RbFeCl_3 . N. Suzuki (Dept. of Material Phys., Osaka Univ., Toyonaka, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1235-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
- Magnetic properties of pseudo-one-dimensional singlet-ground-state system RbFeCl_3 are studied by taking into account interchain coupling. On the basis of the dynamical CEF approximation various magnetic properties are well explained quantitatively. The ratio of the interchain coupling to the intrachain coupling is estimated to be ~ 0.1 . (12 refs.)
- 62572 Dynamic formfactor of neutron scattering on solitons in quasi-one-dimensional magnetics. V.K. Fedyanin (Joint Inst. for Nuclear Res., Dubna, Moscow, USSR). *J. Magn. & Magn. Mater. - The general expression the author has found earlier for the dynamic formfactor $S(\mathbf{q}, \omega)$ (1982) was used to analyse experiments on the neutron scattering by the 'gas' of solitons in magnetics: in magnetics of the type of 'light axis', 'light plane', quasi-one-dimensional, isotropic, Heisenberg ferromagnets with magnon-phonon interaction. (14 refs.)

- 62573 Magnetic excitations in CeAs, an effective $S=1/2$ FCC antiferromagnet. B. Halg, A. Furrer (Inst. fur Reaktortech., Eidgenossische Tech. Hochschule Zurich, Wurenlingen, Switzerland), J.K. Kjems, O. Vogt. *Phys. Rev. Lett. (USA)*, vol.50, no.14, p.1085-8 (4 April 1983).
- The magnetic excitations in the well isolated ground-state double Γ_7 of CeAs have been studied by inelastic neutron scattering. The spin-wave excitation is split into two modes of transverse polarization as a result of exchange anisotropy. One of these modes exhibits nearly zero energy gap and quadratic dispersion which have not previously been observed in antiferromagnets. A random-phase-approximation calculation based on a single-q type-I antiferromagnetic structure is in good agreement with the observed spectrum. (8 refs.)

Univ., Canberra, Australia). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1465-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
- The far infrared spectrum of $\text{FeCl}_2 \cdot \text{Co}$ shows a localised mode from whose position a set of Fe-Co exchange parameters has been determined. Mossbauer spectra of the mixtures $\text{Fe}_{1-x}\text{Co}_x\text{Cl}_2$ have been measured and their analysis yields a variation of iron-spin orientation consistent with calculations using these parameters. (5 refs.)
- 62576 Measuring the exchange constant A_{ex} in metglas 2826. E. Lopez, C. Aroca (Dept. de Magnetismo, Univ. Complutense, Madrid, Spain), P. Sanchez. *J. Magn. & Magn. Mater. (Netherlands)*, vol.36, no.1-2, p.175-9 (1 April 1983).
- The authors have measured the energy of Bloch's walls in amorphous ferromagnetic ribbons using a method devised by R. Aleonard et al. for thin monocrystalline ferromagnetic films. To do this, they had to induce unidirectional anisotropy in the amorphous samples using stress. By measuring the movements of the walls for different current intensities, using the Bitter technique, they have obtained the wall energy value and thus the exchange constant A_{ex} . The results were of the order of 6×10^{-12} J/m which tallies with the results of other researchers who used different methods. (8 refs.)
- 62577 A model calculation of superexchange interaction and comparison among different methods. N. Fuchikami (Dept. of Phys., Tokyo Metropolitan Univ., Tokyo, Japan). *Physica B & C (Netherlands)*, vol.115 B+C, no.2, p.219-24 (Jan. 1983).
- A perturbational formalism developed previously is applied to a 3-center 4-electron model of superexchange interactions. Both Lowdin's orthogonalized basis and biorthogonal basis set constructed from nonorthogonal atomic orbitals are used to obtain the exchange parameter and results are compared with complete configuration interaction calculations. The model shows ferromagnetic coupling for bond angles around 90° and an antiferromagnetic one for large and small angles. This qualitative feature is independent of the type of calculation and coincides with the results obtained by Van Kalker et al. (1979) based on several other methods. Simplified revisions of the perturbational formula are examined. (14 refs.)

- Hennig's path-model description of the isotropic exchange coupling between Cr^{3+} pairs in spinel is extended to include looped paths and some of the exchange and overlap integrals involved have been calculated. It is shown

that, with these developments, the model is no longer consistent with the experimental data. (6 refs.)

62579 X_r method for the magnetic transition state and exchange interactions in KNiF_3 . A.I.Likhtenshtein, V.A.Gubanov (Inst. of Chem., Acad. of Sci., Sverdlovsk, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.9, p.1445-8 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2545-50 (Sept. 1982). [received: April 1983]

The energies of magnetic excitations corresponding to spin reversal of a localized moment of a $3d$ ion in an antiferromagnetic insulator KNiF_3 are calculated. The first-principle method of a magnetic transition state is used to calculate the excitation energies within the framework of the local spin density functional with various forms of the exchange correlation potential. The calculated superexchange interaction parameters and the calculated Neel temperature are in good agreement with the experimental results. The effect of the chemical bonding on the magnetic properties of transition metal compounds is discussed. (18 refs.)

62580 Magnetocrystalline anisotropy of dysprosium and erbium ions in compounds of the RCO_3 type. A.S.Ermolenko, A.F.Rozhda (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.267-72 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A study was made of the magnetic moments and orientation of the easy magnetization axes of single crystals of $\text{Dy}_x\text{Y}_{1-x}\text{Co}_{5+0.2x}$, $\text{Dy}_x\text{Sm}_{1-x}\text{Co}_{5+0.2x}$, and $\text{Er}_x\text{Y}_{1-x}\text{Co}_{5+0.2x}$. The magnetization curves were recorded at 4.2K along various crystallographic directions and were then used to find the anisotropy constants of the Dy and Er ions, as well as the molecular fields of the exchange interaction with the Co sublattice acting on these ions. (10 refs.) A.T.

62581 Magnetic anisotropy in dilute Fe-Cu single crystal. M.Takahashi, S.Ishio, Y.Sasaki (Dept. of Appl. Phys., Tohoku Univ., Sendai, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1409-10 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The change in the magnetic anisotropy for solution-quenched 0.9% Fe-Cu single crystal was measured with subsequent annealing. The results are analyzed in connection with environmental changes around the Fe atom. (3 refs.)

62582 Induced anisotropy in amorphous Co-P alloys. J.M.Riveiro, G.Rivero, M.C.Sanchez (Facultad de Fisicas, Univ. Complutense, Madrid, Spain).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1551-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Anisotropy induced by magnetic annealing has been measured in electrodeposited amorphous Co-P alloys with between 9 and 20 at.% P. The maximum induced anisotropy takes place at ~ 11 at.% P and cancels out at ~ 22 at.% P. This result is compatible with the binary dense random packed hard spheres (DRPHS) model if the P cannot occupy the tetrahedral holes. (6 refs.)

62583 Helical anisotropy induced by annealing in Metglas 2826. A.Hernando, V.Madurga, J.M.Gonzalez, F.Cebollada (Lab. Magnetism, Facultad de Fisicas, Univ. Complutense, Madrid, Spain).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1553-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The magnetic anisotropy induced by constant torsional strain annealing of an amorphous alloy with nominal composition $\text{Fe}_{40}\text{Ni}_{40}\text{P}_{14}\text{B}_6$ has been studied. The influence of annealing conditions is reported and discussed. The experimental results indicate that magnetoelastic coupling is the main source of the induced anisotropy, the anelastic and plastic creep contributions being almost negligible. (5 refs.)

62584 Crystallization and anisotropy in amorphous $\text{Fe}_{81}\text{B}_{13}\text{Si}_3\text{C}_2$. N.Saegusa, A.H.Morrish (Dept. of Phys., Univ. of Manitoba, Winnipeg, Manitoba, Canada).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1555-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Magnetic anisotropy in amorphous $\text{Fe}_{81}\text{B}_{13}\text{Si}_3\text{C}_2$ ribbons (Metglas 2605SC) that develops after thermal treatments is correlated with the crystallization at the surface layers and in the bulk. (3 refs.)

62585 Anisotropies and domain structures in metallic glasses. P.Salzmänn, W.Grimm, A.Hubert (Inst. für Werkstoffwissenschaften, Univ. Erlangen, Erlangen, Germany).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1599-600 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Demonstrates that a metallic glass with a so-called stress-pattern magnetization configuration could be an almost ideal soft magnetic material. To optimize the material in this direction it is useful to find methods to characterize such stress patterns. The authors show it is possible to determine all relevant anisotropy parameters by application of tension and twist to the specimen and demonstrate the procedure for a number of examples. (5 refs.)

62586 Investigation of magnetic and martensitic phase transitions in Vicalloy-type alloys. I.Ya.Georgieva, L.A.Matyushenko (Inst. of Metallography & Phys. of Metals, Moscow, USSR).

Fiz. Met. & Metallogr. (USSR), vol.55, no.2, p.358-62 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A study was made of austenitic alloys based on Fe-Co and close in composition to Vicalloys but containing nickel. The replacement of iron with nickel resulted in a magnetic transition from the paramagnetic to the ferromagnetic state. Dilatometric measurements yielded the composition dependences of the martensitic point M_s of the γ - α transition and of the Curie points θ_c of austenite of two series of alloys: K52F9+Ni and K52F11+Ni. The magnetic and martensitic phase transitions in this system were similar to those in Fe-Ni alloys. The characteristic features of martensitic reactions were attributed to the magnetic inhomogeneity of the γ solid solution. (8 refs.) A.T.

62587 Synthesis and magnetic properties of $(\text{Mn}_{1-x}\text{Ta}_x)_2\text{B}_4$. T.Ishii, M.Shimada, M.Koizumi (Inst. of Sci., Industrial Res., Osaka Univ., Osaka, Japan).

J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.3294-6 (15 March 1983).

Solid solution of $(\text{Mn}_{1-x}\text{Ta}_x)_2\text{B}_4$ ($0 \leq x \leq 1$) with Ta_2B_4 -type structures were synthesized under high pressure-temperature conditions, and their crystallographic and magnetic properties were examined. From the results of magnetic measurements, the solid solutions were found to be ferromagnetic in the range of $0.1 \leq x \leq 0.4$ and its Curie temperature change from 530 to 780K. The Curie temperature of $(\text{Mn}_{1-x}\text{M}_x)_2\text{B}_4$ ($\text{M}=\text{Cr, Mo, Ta}$) changes linearly with unit cell volume. (8 refs.)

62588 Magnetic properties of La_2Ni_3 . F.T.Parker, H.Oesterreicher (Dept. of Chem., Univ. of California, San Diego, La Jolla, CA, USA).

J. Less-Common Met. (Switzerland), vol.90, no.1, p.127-36 (March 1983).

The magnetic properties of La_2Ni_3 are examined. Single-phase hexagonal La_2Ni_3 is found to order antiferromagnetically at $T_N=51\text{K}$. The Curie-Weiss temperature is positive ($\theta=70\text{K}$). Metamagnetic behavior is observed. The metamagnetic field at 4.2K, which is about 61 kOe, indicates a large sublattice anisotropy ($K_2 > 1.6 \times 10^6 \text{ erg cm}^{-3}$). The metamagnetic fields for other temperatures are proportional to the sublattice moment. Hexagonal La_2Ni_3 is shown to exhibit itinerant exchange coupling properties and is thus an itinerant antiferromagnet. The sign of exchange coupling is found to oscillate in the RNi_3 compound series as a function of the number of d electrons per transition metal. The data for rhombohedral La_2Ni_3 indicate that this compound is ferromagnetic. (27 refs.)

62589 A conical-point instability in triangular antiferromagnets caused by the dipole-dipole interaction. H.Shiba, N.Suzuki (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1035-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

In triangular XY-like antiferromagnets the dipole interaction can cause a new type of incommensurate state reflecting the conical-point property of the dipole interaction. A study is made on the phase transition and the effect of the in-plane field. The theory is applicable to AFCl_3 ($\text{A}=\text{Rb, Cs, Tl}$). (9 refs.)

62590 In plane competitive interactions in uniaxial metamagnets. E.Rastelli, A.Tassi (Istituto di Fisica, Univ. di Parma, Parma, Italy).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1041-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

A sketch of the ladder approximation for metamagnets with small interplane coupling and in plane nnn antiferromagnetic interaction is given. Unexpected striking effects of the nnn coupling are found. The results are applied to FeCl_2 and FeBr_2 to provide thermal renormalization and damping of the uniform mode. The fit with the existing experimental data is satisfactory. (9 refs.)

62591 The magnetic ordering in a hexagonal antiferromagnet. F.Matsubara (Dept. of Engng. Sci., Tohoku Univ., Sendai, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1045-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The magnetic ordering in a hexagonal antiferromagnetic model of $S=1$ with anisotropy energies is studied by using the molecular field approximation. This model is shown to exhibit a variety of magnetic ordering processes as the temperature lowers. The author's results qualitatively explain the phase diagram of CsNiCl_3 . (6 refs.)

62592 Magnetoelastic phase transition in KMnF_3 . J.Bartolome (Dept. of Thermodynamics, Univ. of Zaragoza, Zaragoza, Spain), J.A.Rojo, R.Navarro, D.Gonzalez, M.R.Ibarra, A.Del Moral.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1052-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Linear thermal expansion at zero magnetic field and at 12 kOe, as well as magnetic AC susceptibility at zero DC field, for a single crystal and powdered samples of KMnF_3 are reported. The magnetic phase transition at 81K, which originates weak ferromagnetism is of magnetoelastic origin. The magnetic properties are analyzed in terms of the D_{2h} space group. (10 refs.)

62593 Magnetic order in the $(\text{TM}_{1-x}\text{Y}_x)_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$ system. S.Simizu, S.A.Friedberg (Phys. Dept., Carnegie-Mellon Univ., Pittsburgh, PA, USA).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1065-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The effect of dilution on induced-moment ordering in the system $(\text{TM}_{1-x}\text{Y}_x)_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$ with $0.5 \leq x \leq 1$ was studied by magnetic measure-

ments between 0.06 and 4.2K. T_c falls much more slowly with x than predicted by mean-field theory including hyperfine interactions. Dipolar interactions may produce an ordered phase resembling a spin glass for $x \leq 0.9$. (5 refs.)

62594 Ferro and antiferromagnetic ordering in $\text{N}(\text{C}_2\text{H}_5)_4\text{FeCl}_4$ depending on the cooling rate. J.A.Puertolas (Dept. of Phys., Univ. of Zaragoza, Zaragoza, Spain), R.Navarro, F.Palacio, D.Gonzalez, R.L.Carlin, A.J.van Duyneveldt.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1067-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Magnetic AC susceptibility at zero DC field of a single crystal and of powdered samples of $\text{N}(\text{C}_2\text{H}_5)_4\text{FeCl}_4$ are reported. Upon slow cooling the authors get an antiferromagnetic ordering below $T_c=2.9\text{K}$, whereas in the case of a fast cooling a ferromagnetic arrangement below $T_c=1.8\text{K}$ is detected. Explanations for such behaviour are advanced and a tentative analysis of the antiferromagnetic case is done. (8 refs.)

62595 Effect of Cu and Co impurities on the phase diagram and the bicritical point of $\text{CsMnCl}_3 \cdot 2\text{H}_2\text{O}$. E.Velu, R.Megy, J.Seiden, J.P.Renard (Inst. d'Electronique Fondamentale, Univ. Paris Sud, Orsay, France).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1069-70 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The authors have measured the reduction of the Neel temperature and the bicritical field due to Cu and Co impurities in $\text{CsMnCl}_3 \cdot 2\text{H}_2\text{O}$ (CMC). They have determined the phase diagram near the bicritical point for CMC: 0.7% Cu. The results are not in accordance with the bicritical random field behavior. (13 refs.)

62596 Spin flopping in MnTiO_3 . H.Yamauchi, H.Hiroyoshi, M.Yamada, H.Watanabe, H.Takei (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1071-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Susceptibility and magnetization have been measured on a single crystal of MnTiO_3 . Spin-flopping is observed in the magnetization curve with the field along the hexagonal c-axis. The exchange parameter and the anisotropy constant are estimated from the experimental data, the latter being 2.3 times smaller than the calculated value for the dipole interactions. (5 refs.)

62597 A microscopic model describing the spin-flip processes at the first-order antiferromagnetic-to-ferromagnetic phase transition in $\text{Dy}_2\text{O}_3\text{SO}_4$. H.Hulsing, H.G.Kahle, A.Kasten (Phys. Inst., Univ. Karlsruhe, Karlsruhe, Germany).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1073-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

In applied magnetic fields, the antiferromagnet (af) $\text{Dy}_2\text{O}_3\text{SO}_4$ is transformed into the paramagnetic saturated state via an intermediate ferrimagnetic (fi) phase. The effects leading to a pronounced asymmetric hysteresis and large time constants at the af-fi transition are explained within a microscopic model discussing the possible sequences of single spin-flip processes. (6 refs.)

62598 The effect of paramagnetic impurities on the wave-vector of the spin-density-wave of an itinerant electron antiferromagnet. L.Gunther (Dept. of Phys., Tufts Univ., Medford, MA, USA), M.M.Antonoff.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1077-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

It is shown that magnetic impurities can produce a first order phase transition between the commensurate and incommensurate spin-density-wave phases of an itinerant electron antiferromagnet. The result is a consequence of the impurity-induced discontinuity in the wave-vector of the SDW at the phase boundary. (1 ref.)

62599 Effects of hydrostatic pressure on phase transition of some low-dimensional systems. K.Takeda, M.Wada, A.Ohtani, A.Onodera, T.Haseda (Faculty of Engng. Sci., Osaka Univ., Toyonaka, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1193-5 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The possibility of controlling the dimensionality of magnetic interactions and spin symmetry has been undertaken by applying the hydrostatic pressure to magnetic compounds. The Neel temperature, magnetic phase diagram, exchange constant and anisotropy field have been obtained as a function of the applied hydrostatic pressure in $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$. (3 refs.)

62600 Field-induced increase of the Neel temperature in a two-dimensional system. K.Koyama, K.Amaya, K.Takeda (Faculty of Engng. Sci., Osaka Univ., Toyonaka, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1196-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The fully mapped magnetic phase diagram of a quasi-two-dimensional (2d) antiferromagnetic $\text{Mn}(\text{HCOO})_2 \cdot 2\text{H}_2\text{O}$ has been determined by measurement of the magnetic heat capacity and susceptibility. An anomalous increase of the Neel temperature $T_N(H)$ has been found for the first time in this 2d compound. (6 refs.)

62601 Magnetic properties of the quasi-2d easy plane antiferromagnet $\text{BaNi}_2(\text{PO}_4)_2$. L.P.Rognault, J.Rossat-Mignod, J.Y.Henry, L.J.De Jongh (Dept. de Recherche Fondamentale, CENG, Grenoble, France).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1205-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The magnetic properties of the layered compound $\text{BaNi}_2(\text{PO}_4)_2$ have been studied using susceptibility, elastic and inelastic neutron scattering measurements. Important effects have been observed when the temperature approaches T_N , which suggest the existence of a phase transition of the Kosterlitz-Thouless type in this system. (10 refs.)

62602 The H-T phase diagram for the spin-glass Ag:Mn. R.V.Chamberlain, M.Hardiman, L.A.Turkevich, R.Orbach (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1423-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The magnetic field-temperature spin glass transition line has been measured for the dilute magnetic alloy Ag:Mn, and the insulator $\text{Eu}_{0.4}\text{Sr}_{0.6}\text{S}$ (by Bon-temps et al. 1982). In both cases, the longitudinal magnetization is of the de Almeida-Thouless form $(\Delta H)^{2/3} = (1 - [T_G(H)/T_G])^{2/3}$, where A depends on the time scale of the experiment. (11 refs.)

- 62603 Random fields and ordering in antiferromagnetic insulators.** R.A.Cowley (Brookhaven Nat. Lab., Upton, NY, USA). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1439-41 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
- Neutron scattering measurements of the effect on the long-range order and phase transitions of random magnetic fields are reviewed. The results at low temperatures in $\text{Rb}_2\text{Co}_2\text{Mg}_{1-x}\text{F}_4$ and $\text{Co}_2\text{Zn}_{1-x}\text{F}_2$ show that the long-range order is not established when samples are cooled in a magnetic field, but they form a state with unusually long magnetic correlations. In $\text{Mn}_2\text{Zn}_{1-x}\text{F}_2$ a similar state is formed by only very close in temperature to T_N . (10 refs.)
- 62604 Environment effect in random mixtures with competing magnetic anisotropies.** H.Mano (Dept. of Phys., Gakushuin Univ., Tokyo, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1453-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
- The magnetic properties of a mixture of two kinds of antiferromagnets are investigated taking into account the dependence of the effective field acting on a spin on its neighboring atomic configuration. A broad orientation distribution of thermal averages of spins is obtained in the oblique antiferromagnetic phase. (2 refs.)
- 62605 Phase diagram of random mixtures of antiferromagnets with competing anisotropy.** H.Miwa (Faculty of Liberal Arts, Shinshu Univ., Matsumoto, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1455-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
- A generalized molecular-field theory which takes into account local atomic environment explicitly, is developed to study the phase diagram of random mixtures with competing magnetic anisotropy. The lower transition temperature is found to be very sensitive to the approximation employed. (4 refs.)
- 62606 NMR observation of oblique phase in mixed crystals $(\text{CH}_3\text{NH}_3)_2\text{Cu}(\text{Cl}_{1-x}\text{Br}_x)_4$ ($0.5 \leq x \leq 1$).** H.Kubo, Y.Suzuki, K.Kirakawa (Faculty of Engng., Kyushu Univ., Fukuoka, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1461-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
- It was recently reported by Kimishima (1980) that the transition from the ferromagnetic to the antiferromagnet occurs at $x \approx 0.9$ in a mixed compound of $(\text{CH}_3\text{NH}_3)_2\text{Cu}(\text{Cl}_{1-x}\text{Br}_x)_4$. By the Cl NMR, the authors show that in the concentration region of the oblique phase, the Br^- ions occupy a position on the c -axis, contrary to anticipation. (6 refs.)
- 62607 Magnetic properties of amorphous Fe-Nb and Fe-Zr.** K.M.Unruh, C.L.Chien (Dept. of Phys., Johns Hopkins Univ., Baltimore, MD, USA). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1587-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
- Magnetic ordering temperatures and values of the effective hyperfine field have been obtained for a number of amorphous $\text{Fe}_x\text{Nb}_{100-x}$ and $\text{Fe}_x\text{Zr}_{100-x}$ alloys for compositions at and above the threshold for magnetic ordering, found at $x=55$ and $x=45$, respectively. For both sets of samples the effective hyperfine field is found to rise linearly with composition. The magnetic ordering temperatures, while rising monotonically in $a\text{-Fe}_x\text{Nb}_{100-x}$, display a maximum at about $x=85$ in $a\text{-Fe}_x\text{Zr}_{100-x}$. (4 refs.)
- 62608 Magnetic hyperfine field distribution and structural relaxation of amorphous $(\text{Fe}_{81.5}\text{B}_{14.5}\text{Si}_4)$ prepared with different quenching rates.** G.Fratucello, F.Ronconi (Istituto di Fisica, Univ. di Ferrara, Ferrara, Italy), P.Allia, G.P.Sordo, F.Vinai. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1591-3 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
- The hyperfine field distributions of the amorphous $(\text{Fe}_{81.5}\text{B}_{14.5}\text{Si}_4)$ alloy are explained in terms of structural disorder. The increase in Curie temperature with isothermal relaxation may be attributed to the increase of mean number of nearest-neighbor iron atoms around Fe, and so to reduction of topological short-range disorder. (10 refs.)
- 62609 Magnetic properties of $\text{US}_{1-x}\text{Se}_x$ solid solution.** T.Palewski, Z.Bukowski (Inst. of Inorganic Chem. & Metall. of Rare Elements, Tech. Univ. of Wrocław, Wrocław, Poland). *Mater. Sci. (Poland)*, vol.7, no.4, p.463-6 (1981).
- The magnetic parameter of the polycrystalline samples of $\text{US}_{1-x}\text{Se}_x$ solid solutions have been investigated in the temperature range 78-300K. The dependence of the Curie temperature on the mole fraction of selenium (x) exhibits two flat maxima at $x=0.2-0.3$ and $x=0.7-0.8$, the lattice constants and paramagnetic moments showing negative deviations from linearity. The magnetic properties of $\text{US}_{1-x}\text{Se}_x$ alloys are compared with other solid solutions of the uranium monocompounds. (10 refs.)
- 62610 Spin orientations in halides of the rare-earth and actinide series after magnetic phase transitions.** P.Rudra, M.K.Sikdar (Dept. of Phys., Univ. of Kalyani, Kalyani, India). *Phys. Rev. B (USA)*, vol.27, no.7, p.4479-82 (1 April 1983).
- Halides of a rare-earth and actinide series show several magnetic phase transitions where the order of the transitions is not always definitely fixed. Group theoretical analysis shows that second-order phase transition from one magnetic phase to another can occur only for definite magnetic structures. The authors have found out the possible magnetic structures that can arise as a result of second-order phase transitions in these chemical structures. (18 refs.)

- 62611 Mechanism of thermomagnetic recording in an MnBi film.** S.N.Marchenko (All-Union Sci.-Res. Inst. of Optophys. Measurements, Moscow, USSR). *Fiz. Met. & Metallogr. (USSR)*, vol.55, no.2, p.259-62 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
- An investigation was made of thermomagnetic recording in an MnBi film and of its working temperature range. A quantitative dependence of the film magnetization after recording on the exposure was obtained near the threshold. It was found that reversed domains formed as a result of thermomagnetic recording in MnBi near the Curie temperature 743K in a temperature interval of $\sim 4.5\text{K}$. Heating of the film with a flashlamp (144 pulses) reduced the threshold energy density for recording with the aid of laser radiation. (8 refs.) A.T.

62613 Frequency dependent magnetic susceptibility and spin glass freezing in PtMn alloys. G.V.Lecomte, H.von Lohneysen (Phys. Inst., Rheinisch-Westfälischen, Tech. Hochschule Aachen, Aachen, Germany), E.F.Wassermann. *Z. Phys. B (Germany)*, vol.50, no.3, p.239-45 (1983).

Reports measurements of the low-field complex magnetic susceptibility on $\text{Pt}_{1-x}\text{Mn}_x$ for $x=0.01, 0.025$ and 0.05 and for frequencies ν between 10 and 4000 Hz. A strong frequency dependence of the freezing temperature T_f is observed: $\Delta T_f/T_f \Delta \ln \nu = 0.025$ (decade ν)⁻¹ for all three alloys. These results as well as previous other measurements are interpreted in terms of a phenomenological model. (34 refs.)

62614 Many-soliton solutions of equations for a nonisotropic magnetic material. A.B.Borisov (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.230-4 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A procedure is proposed for integrating an equation for a nonisotropic magnetic material on the basis of the matrix Riemann problem for doubly periodic functions. The general form of many-soliton solutions is found. (15 refs.) A.T.

62615 High temperature series expansion of staggered susceptibility of the three-state antiferromagnetic Potts model on d-dimensional hypercubic lattices. T.Oguchi, H.Yoshida (Dept. of Phys., Tokyo Inst. of Technol., Tokyo, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1102-4 (April 1983).

The three-state antiferromagnetic Potts model on d-dimensional hypercubic lattices is studied, where d is 2, 3, 4, 5 and 6. The Hamiltonian is expressed by the spin Hamiltonian with spin 1. The staggered susceptibility is calculated by the high temperature series expansion. By use of the ratio method and the Padé approximation, the critical temperature and the critical exponent γ are obtained. It is concluded that the three-state antiferromagnetic Potts model exhibits a second-order transition when $d \geq 3$.

62616 Evidence for cooperativity in quadrupolar glass freezing from Monte Carlo simulations. M.Devoret, D.Esteve (CENS, Gif-sur-Yvette, France).

J. Phys. C (GB), vol.16, no.10, p.1827-40 (10 April 1983).

The authors present a Monte Carlo study of a dilute system of interacting classical quadrupoles on an HCP lattice for quadrupole concentrations $X=0.68$ and $X=0.53$. Within their computation time limits which were 4×10^5 MCS per quadrupole for a sample of 96 sites and 10^5 MCS per quadrupole for a sample of 216 sites, they find a progressive growth of the local quadrupolarisations. However, an analysis of the orientational fluctuations sets a lower bound of the order of 10% on the number of correlated quadrupoles responsible for this growth. (20 refs.)

62617 Ordering of spin and orbital moments in a lattice of 3d ions coupled by superexchange. B.Hoppe, L.L.Hirst (Inst. für Theoretische Phys., Univ. Frankfurt, Frankfurt, Main, Germany).

J. Phys. C (GB), vol.16, no.10, p.1919-32 (10 April 1983).

The authors consider the statistical mechanics of a lattice of orbitally degenerate magnetic ions coupled by superexchange. In such systems the ordering phenomena involve orbital as well as spin moments and may lead to various ordered phases and phase transitions. In particular, it is shown that the characteristic product form of the superexchange coupling leads, by a sign-reversal mechanism, to orbital phase transitions that occur at temperatures small compared with the Neel temperature for spin ordering. To treat such systems they develop an approximation scheme based on a 'factorisation approximation' which separates the total problem into spin and orbital subproblems. Detailed calculations are given for the specific case of 3d ions with triplet crystal-field orbital ground levels in perovskites. (11 refs.)

62618 Ordering in an orbital superexchange model. B.Hoppe, R.Liebmann, L.L.Hirst (Inst. für Theoretische Phys., Univ. Frankfurt, Frankfurt/Main, Germany).

J. Phys. C (GB), vol.16, no.10, p.1933-44 (10 April 1983).

The orbital superexchange model is a semiclassical model in which the ions of simple cubic lattice each have three purely orbital states apiece, each of which couples preferentially along a different cubic axis. The authors investigate the statistical mechanics of this model by means of exact results, analytical approximations and expansions, and Monte Carlo calculations. They find that for a negative coupling constant there is a strongly discontinuous phase transition to a phase with simple ferro ordering, and a ground state with infinite degeneracy but vanishing entropy density. For a positive coupling constant there is no phase transition and a large zero-point entropy, S_0 . They derive rigorous upper and lower bounds for S_0 and obtain a Pauling estimate that is in good agreement with the Monte Carlo value. The absence of ordering when the coupling constant is positive is due not to frustration but rather to an opposite effect which they call saturation. (16 refs.)

62619 Theoretical study of the magnetic properties of an antiferromagnetic system with two kinds of inequivalent magnetic-ion sites. N.Suzuki, K.Motizuki (Dept. of Material Phys., Osaka Univ., Toyonaka, Japan).

J. Phys. C (GB), vol.16, no.11, p.2133-43 (20 April 1983).

On the basis of the dynamical correlated effective-field approximation (DCEFA) the authors study the magnetic properties of an antiferromagnetic system with crystal structure of the hexagonal BaTiO_3 type which has two kinds of inequivalent magnetic-ion sites. They calculate the Neel temperature and the sublattice magnetisation for various sets of exchange parameters. The results of calculation are compared with those obtained by the simple molecular-field approximation and the pair and lone spin model. One of the advantages of the DCEFA is that it can treat moment reduction of both kinds of inequivalent spins. The spin wave dispersion is also calculated. (19 refs.)

62620 Fully anisotropic triangular lattice quenched bond-random Potts ferromagnet: almost exact critical frontier. C.Tsallis (Centro Brasileiro de Pesquisas Fisicas/CNPq, Rio de Janeiro, Brazil).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1047-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Through convenient duality and star-triangle-type generalized transformations, the author obtains a (presumably excellent for $1 \leq q \leq 4$) approximate phase diagram for the fully anisotropic triangular lattice quenched bond-random

q-state Potts ferromagnet. Several exact particular results are obtained; a small error is, however, present in one of the limiting slopes. (7 refs.)

62621 Specific heat study of the transition from ferromagnetism to antiferromagnetism in terbium. K.D.Jayasuriya, S.J.Campbell, A.M.Stewart, E.S.R.Gopal (Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1055-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The specific heat of single crystal terbium has been measured over the range 200-400K. A value for the latent heat of $(13.6 \pm 0.6) \text{ J mol}^{-1}$ is obtained at the first order antiferromagnetic to ferromagnetic transition temperature $T_N = (221.45 \pm 0.03) \text{ K}$. A temperature hysteresis of $(0.24 \pm 0.03) \text{ K}$ is observed in the transition. (7 refs.)

62622 Magnetic phase transitions in presence of bilinear and quadrupolar interactions in rare earth compounds. P.Morin, D.Schmitt (Lab. Louis Neel, CNRS, Grenoble, France).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1059-60 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

A Landau expansion of the free energy in the non-ordered phase of cubic rare earth intermetallics is obtained from an analytical susceptibilities formalism taking into account the exact crystalline electric field. The deduced magnetic dipolar and quadrupolar phase diagram closely agrees with experimental observations. (6 refs.)

62623 Dynamics of magnetic response near T_c . A.S.Arrott, B.Heinrich (Dept. of Phys., Simon Fraser Univ., Burnaby, BC, Canada).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1084-5 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Linear response theory is applied to systems with many low lying excitations that influence relaxation rates. Formulation is holistic. The place for power laws is discussed. Applications are to spin glasses and to dynamic critical behavior in ferromagnetic iron whiskers. (5 refs.)

62624 Theoretical study of magnetism of spin system with alternating strong and weak exchange coupling. K.Motizuki, N.Suzuki (Dept. of Material Phys., Osaka Univ., Toyonaka, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1225-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The magnetic properties of antiferromagnetic systems with alternating strong and weak exchange couplings are theoretically studied on the basis of the pair- and lone-spin model and the dynamical correlated-effective-field approximation. The results of the calculations are compared with those that follow from the conventional molecular-field approximation. (7 refs.)

62625 Anisotropy effects in the ferromagnetic quantum chain systems $(\text{C}_6\text{H}_{11}\text{NH}_3)_2\text{CuCl}_2$ (CHAC) and $(\text{C}_6\text{H}_{11}\text{NH}_3)_2\text{CuBr}_2$ (CHAB). K.Kopinga, H.Nishihara, W.J.M.de Jonge (Eindhoven Univ. of Technol., Eindhoven, Netherlands).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1241-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Heat capacity and magnetization measurements on the title compounds revealed that they are very good approximations of a ferromagnetic $S=1/2$ Heisenberg chain system. The small anisotropy present in these compounds gives rise to very pronounced cross-over effects. In CHAC, the cross-over temperature is increased by a magnetic field parallel to the easy axis. (5 refs.)

62626 Spin glass like behaviour of the solid solution $\text{Mn}_{3/2}\text{Ga}_{0.5}\text{N}$. J.Garcia (Dept. de Termologia, Univ. de Zaragoza, Zaragoza, Spain), J.A.Rojas, R.Navarro, J.Bartolome, D.Gonzalez.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1401-3 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Magnetic AC susceptibility and magnetization measurements on the solid solution $\text{Mn}_{3/2}\text{Ga}_{0.5}\text{N}$ were performed. Analysis of the data led the authors to propose, for $T < 160 \text{ K}$, a spin-glass like magnetic phase. (7 refs.)

62627 Dynamics of disordered spin systems studied by zero- and longitudinal μSR . I. (FeTiO₃)₈₈(Fe₂O₃)₁₂. Y.J.Uemura, K.Nishiyama, R.Kadono, J.Imazato, Y.Kuno, K.Nagamine, T.Yamazaki, Y.Ishikawa (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1379-80 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Zero-field muon spin relaxation measurement in a spin glass (FeTiO₃)₈₈(Fe₂O₃)₁₂ exhibited a gradual slowing down of dynamical fluctuation of Fe moments between $170 \text{ K} > T > 50 \text{ K}$, while an onset of static random local fields starts around $T \sim 30 \text{ K}$. Different sharpness of the temperature dependence of muon relaxation in different spin glasses is also pointed out. (8 refs.)

62628 Spin glass properties and magnetic correlation in FeTiO₃-Fe₂O₃ system. Y.Ishikawa, M.Arai, N.Saito, M.Kohgi (Phys. Dept., Tohoku Univ., Sendai, Japan), H.Takei.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1381-3 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The c axis component of spins in a randomly mixed system 0.88 FeTiO₃-0.12 Fe₂O₃ exhibits spin glass properties below 38K. The temperature evolution of the magnetic correlations of both the c axis and the perpendicular components, $\langle M_i(q)M_j(-q) \rangle$ and $\langle M_i(q)M_j(-q) \rangle$, have been determined by neutron small angle scattering using a single crystal. (5 refs.)

62629 Magnetic relaxation in the spin glass BaO₂TiO₃·2Fe₂O₃. K.Iwawuchi, Y.Ikeda, N.Koizumi, Y.Bando (Inst. for Chem. Res., Kyoto Univ., Kyoto, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1384-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The property and structure of an insulating spin glass, BaO₂TiO₃·2Fe₂O₃ were investigated. Spin glass freezing temperature is about 165K. It seems that the blocking of magnetic clusters surrounded by Ti ions is responsible for the spin glass property. There is a magnetic relaxation at 70K. (5 refs.)

62630 Spin-glass compound ($Ti_{1-x}V_xO_2$: relaxation time and its field dependence. T.Saito, Y.Miyako (Dept. of Phys., Hokkaido Univ., Sapporo, Japan), C.J.Sandberg.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1387-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

AC-susceptibility $\chi_0(\omega)$ on powdered $(Ti_{0.9}V_{0.1})_2O_3$ was measured with and without the static magnetic field H . With increasing H , the steep slope of $\ln \chi_0(\omega)$ around T_g becomes gradual and the inflection point shifted to lower temperatures. (8 refs.)

62631 Spin dynamics of an insulating spin-glass $Rb_2Mn_{1-x}Cr_xCl_4$ at the microwave region. M.Tanimoto, K.Katsumata (Res. Inst. of Appl. Electricity, Hokkaido Univ., Sapporo, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1389-90 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Temperature dependence of electron spin resonance (ESR) and the imaginary part of the susceptibility $\chi''(\omega)$ in zero magnetic field at 9.00 GHz have been studied in a new spin-glass, $Rb_2Mn_{1-x}Cr_xCl_4$. Two peaks in $\chi''(\omega)$, one at 11K and the other at 35K, have been observed in the $x=0.5$ sample at zero external field. The former corresponds to the zero field ESR. The latter seems to be explained by the dynamical susceptibility calculated by Kinzel and Fischer (1977) and by Ueno (1980). (13 refs.)

62632 Specific heat measurements in the highly frustrated $CsMnFeF_6$ and $CsNiFeF_6$ compounds. C.Pappa, J.Hammann (Service de Physique du Solide et de Resonance Magnetique, CENS, Gif-sur-Yvette, France), C.Jacoboni.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1391-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The authors performed specific heat measurements on $CsMnFeF_6$ and $CsNiFeF_6$ in the temperature range where the magnetic ordering phenomena occur (27K and 4.7K respectively). The magnetic specific heat of $CsMnFeF_6$ shows a maximum around 27K. No maximum appears in $CsNiFeF_6$, only a sudden change of slope is observed at 6K. Both curves can be fitted to a T^α law at low temperatures ($\alpha=1.35$ and 1.6). (7 refs.)

62633 Spin glass behaviour in chromium spinels. D.Fiorani (ITSE, CNR, Roma, Italy), S.Viticoli, J.L.Dormann, M.Nogues, J.L.Tholence, J.Hammann, A.P.Nurani.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1393-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Experimental evidence of spin glass behaviour ($T_g=2.50K$ at $\nu=17$ Hz) is given for $ZnCr_{1-x}Ga_xO_4$ spinel by low field DC and AC susceptibility measurements, as well as by neutron diffraction measurements and Mossbauer spectra. (5 refs.)

62634 Spin dynamics and spin glass transition in the quasi-1D system $FeMgBO_4$. A.Wiedenmann (Inst. Phys. Chem., Univ. of Hamburg, Hamburg, Germany), W.Gunsser, P.Burlet, F.Mezei.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1395-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Inelastic neutron scattering experiments revealed a diffusive behaviour of the spin dynamics. A quadratic Q - and a linear T -dependence of the relaxation rate above 30K is ascribed to isotropic helical 1D-correlations. A drastic increase of τ_r reflects a rather sharp cross-over transition to a highly frustrated 3D spin glass state. (7 refs.)

62635 Ferromagnetic and spin glass behavior near the critical concentration in amorphous $(Fe_{0.9}Ni_{0.1-x}Gd_x)_2P_{16}Al_3$. J.W.Lynn, R.W.Erwin (Dept. of Phys., Univ. of Maryland, College Park, MD, USA), J.J.Rhyne, H.S.Chen.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1397-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The magnetic properties of amorphous $(Fe_{0.9}Ni_{0.1-x}Gd_x)_2P_{16}Al_3$ have been investigated above the critical concentration ($x=17$) for long range order via neutron scattering. For $x=30$ the spin wave stiffness parameter D first increases with decreasing temperature, but then decreases at lower temperatures as the spin state is approached. Accompanied by the decrease in D is an increase in the spin wave linewidths. (6 refs.)

62636 Magnetic relaxation in ferromagnets with competing interactions. M.A.Continentino (Inst. de Fisica, Univ. Federal Fluminense, Niteroi, Brazil).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1413-14 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The author extends the theory of Anderson, Halperin and Varma (AHV) for spin glasses to ferromagnets with competing interactions. The coupling between magnons and two level systems (TLS) leads to a ferromagnetic instability which he associates with the disappearance of long range magnetic order on cooling in reentrant ferromagnet. (7 refs.)

62637 Point contact spectroscopy of internal field distributions in spin glasses. N.d'Ambrumenil, A.M.Duif, A.G.M.Jansen, P.Wyder (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1415-16 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The authors report the point contact spectra of dilute AuMn and CuMn spin glass alloys measured as a function of temperature in the neighbourhood of the spin-glass transition. They relate their results to the temperature-dependent internal field distribution. (4 refs.)

62638 Dynamics and stability of the Sherrington-Kirkpatrick model. J.A.Hertz (Nordita, Copenhagen, Denmark).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1419-20 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The dynamics of a large (but finite) SK model are studied, paying particular attention to the fluctuation-dissipation theorem and the role of a symmetry-breaking external field. The susceptibility exhibits a symmetric cusp for short times and gradually approaches the value $1/T_g$ as the system comes to equilibrium. (10 refs.)

62639 Cooperative phenomena in spin glasses. S.Shtrikman (Dept. of Electronics, Weizmann Inst., Rehovoth, Israel), E.P.Wohlfarth.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1421-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The reasons for considering cooperative phenomena in the Neel model of spin glasses are considered and the Vogel-Fulcher law derived approximately on this basis. As an example, lines in the H - T plane are calculated for different Vogel-Fulcher temperature. (13 refs.)

62640 Critical exponents and the size of the critical region in amorphous GdAl spin glass. A.P.Malozemoff, Y.Imry (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1425-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

A scaling for susceptibility below the transition temperature T_g of a spin glass is proposed. In a GdAl spin glass, it is found to hold at all temperatures below T_g and out to 5000 Oe in field. (7 refs.)

62641 Critical phenomena in systems with random anisotropies. A.Aharony (Dept. of Phys. & Astron., Tel Aviv Univ., Tel Aviv, Israel).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1432-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Current theoretical understanding of the effects of random fields and random anisotropies is reviewed, with emphasis on open questions. (30 refs.)

62642 Magnetic short-range order and spin freezing in the quasi-2D system $LuFeMgO_4$. A.Wiedenmann, W.Gunsser, J.Rossat-Mignod, M.O.Evrad (Inst. fur Phys. Chem., Univ. Hamburg, Hamburg, Germany).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1442-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Neutron diffraction performed on the insulating compound $LuFeMgO_4$ revealed a gradual onset of anisotropic short-range ordering of the moments inside the random diluted double layers. Spin freezing which was observed by a saturation of the static correlations, Mossbauer hyperfine splitting and by a susceptibility maximum is ascribed to the competition between several antiferromagnetic interactions. (4 refs.)

62643 Spin glass in the site-diluted antiferromagnetic FCC. S.Fujiki, T.Suenaga, S.Katsura (Dept. of Appl. Phys., Tohoku Univ., Sendai, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1457-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The diluted spin glass on the frustrated face-centered cubic lattice with the first and second neighbour interactions are considered by the square cactus approximation. Phase boundaries between the paramagnetic and ordered (ferromagnetic, superantiferromagnetic and spin glass) are obtained. The results qualitatively explain the experiments on $Eu_2S_{1-x}P_x$ and $Mn_2Co_{1-x}Te$. (5 refs.)

62644 Intrinsic hardness and micromagnetism in selected $RMn_2Ni_{5-x}Sc_x$ ($R=rare\ earth$). F.T.Parker, H.Oesterreicher (Dept. of Chem., Univ. of California, San Diego, La Jolla, CA, USA).

J. Magn. & Magn. Mater. (Netherlands), vol.36, no.1-2, p.195-207 (1 April 1983).

Bulk magnetic properties of selected compounds in the series $RMn_2Ni_{5-x}Sc_x$ ($R=rare\ earth$) are studied. Micromagnetic properties are pronounced for nonmagnetic or weakly magnetic rare earth analogs, but typical ferromagnetic behavior is seen for Sm analogs. Intrinsic magnetic hardness fields in the latter are quite large relative to their corresponding anisotropy fields, as compared to other typical $CaCu_2$ analogs. Thus, the strong Mn exchange fluctuations enhance domain wall pinning. (34 refs.)

62645 Magnetoresistance near the Curie point of TbZn single crystals. P.P.Freitas, J.Bessa Sousa (Centro de Fisica, Univ. do Porto, Porto, Portugal), P.Morin.

Port. Phys. (Portugal), vol.13, no.3-4, p.185-92 (1982).

Magnetoresistance studies of the intermetallic ferromagnetic TbZn compound have been performed for the first time, with accurate measurements of $\Delta\rho$ (T,H) and $(d\rho/dT)$ coefficients. Analysis of the results supports the theoretical predictions based on renormalization group calculations. (4 refs.)

62646 Solitons in quantum-spin systems. S.T.Chui (Bartol Res. Found., Univ. of Delaware, Newark, DE, USA), K.B.Ma.

Phys. Rev. B (USA), vol.27, no.7, p.4515-17 (1 April 1983).

Numerical results such as the specific heat, magnetic susceptibility, ground-state energy, and the magnon gap obtained with computer renormalization-group techniques are presented for $CsNiF_3$. No soliton states of the type analogous to the sine-Gordon kink were found. This is supported by analytic calculations of the quantum fluctuations of a winding number operation. (20 refs.)

62647 Long-time behavior of spin-glasses at low temperatures. I.Morgenstern (Inst. fur Theoretische Phys., Univ. Heidelberg, Heidelberg, Germany).

Phys. Rev. B (USA), vol.27, no.7, p.4522-5 (1 April 1983).

The free-energy barrier heights between different 'ground-state valleys' in configuration space are calculated by a new numerical method. The resulting relaxation times are so long that a decay of the freezing temperature T_f to zero as predicted by static theories is not to be observed in experiments. The absence of a phase transition occurs therefore only in a mathematical sense. (12 refs.)

75.40D Ising and other classical spin models

- 62648 Monte Carlo study of an Ising gauge system.** S.Wansleben, A.Weinkauff (Inst. fur Theoretische Phys., Univ. zu Köln, Köln, Germany). *Z. Phys. B (Germany)*, vol.50, no.3, p.255-61 (1983).
The phase diagram of the 3-d Ising gauge model with additional ferromagnetic nearest neighbour Ising coupling is explored by Monte Carlo simulations. (11 refs.)
- 62649 Surface effects in Ising ferromagnets with anisotropy.** I.Tamura (Dept. of Phys., Nagoya Univ., Nagoya, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.4, p.1105-7 (April 1983).
The author extends a previous model of a semi-infinite Ising ferromagnet with anisotropy so as to incorporate not only the surface effects on anisotropy, but also those on exchange couplings into the model. The phase diagrams and the ordering temperatures for the surface magnetism of this extended model are examined by a new effective-field theory. The previous result that the surface cannot order before the bulk does when the author takes no account of the surface effects on the exchange couplings can be seen more clearly in those diagrams. The results obtained by a usual molecular-field theory are also given to compare with those of the effective-field theory. (5 refs.)
- 62650 Phase transitions on fractals. I. Quasi-linear lattices.** Y.Gefen, A.Aharony (Dept. of Phys. & Astron., Tel-Aviv Univ., Tel-Aviv, Israel), B.B.Mandelbrot. *J. Phys. A (GB)*, vol.16, no.6, p.1267-78 (21 April 1983).
Magnetic spin models and resistor networks are studied on certain self-similar fractal lattices, which are described as 'quasi-linear', because they share a significant property of the line: finite portions can be isolated from the rest by removal of two points (sites). In all cases, there is no long-range order at finite temperature. The transition at zero temperature has a discontinuity in the magnetisation, and the associated magnetic exponent is equal to the fractal dimensionality, D . When the lattice reduces to a non-branching curve the thermal exponent $\nu^{-1} = \gamma$ is equal to D . When the lattice is a branching curve, γ is related, respectively, to the dimensionality of the single-channel segments of the curve (for the Ising model), or to the exponent describing the resistivity (for models with continuous spin symmetry). (30 refs.)
- 62651 Stability of Parisi's solution of a spin glass model.** A.V.Goltsev (A.F. Ioffe Phys.-Tech. Inst., Acad. of Sci., Leningrad, USSR). *J. Phys. A (GB)*, vol.16, no.6, p.1337-43 (21 April 1983).
The condition of stability of Parisi's solution of the infinite-range spin glass model is obtained and examined near the transition temperature. The matrix of second derivatives $\partial^2 F / \partial Q_{\alpha\beta} \partial Q_{\gamma\delta}$ has non-negative eigenvalues only. There are two continuous branches of the eigenvalues and zero is an accumulation point of the eigenvalues. (14 refs.)
- 62652 Existence of spin-glass phases for three- and four-dimensional Ising and Heisenberg models.** A.Benyoussef, N.Boccaro (Service de Phys. du Solide et de Résonance Magnétique, CENS, Gif-sur-Yvette, France). *J. Phys. C (GB)*, vol.16, no.10, p.1901-18 (10 April 1983).
Using Migdal's recursion relations the authors investigate the existence of spin-glass phases for bond-diluted Ising and Heisenberg models with randomly distributed nearest-neighbour ferro- and antiferromagnetic interactions. For three-dimensional systems a spin-glass phase can only exist at zero temperature, while four-dimensional systems exhibit spin-glass phases at finite temperature. They show that very general considerations imply strong restrictions on the form of 1D recursion relations. As a consequence, the qualitative properties of all the systems they considered are very close. (19 refs.)
- 62653 Critical behaviour of impure Ising-Mattis model.** A.K.Roy, S.K.Roy, B.K.Chakrabarti (Saha Inst. of Nuclear Phys., Calcutta, India). *J. Phys. C (GB)*, vol.16, no.11, p.2115-20 (20 April 1983).
The effects of compressibility (annealed impurity) and dilution (quenched impurity) on the critical behaviour of the Ising-Mattis (spin-glass) model are investigated. The quenched impurity is seen to determine the ultimate critical behaviour unless it so happens that the quenched disorder can be completely transformed away when, of course, the annealed impurity shows up its effects. (13 refs.)
- 62654 Phase diagram for the triangular Ising lattice.** M.Kaburagi, T.Tonegawa, J.Kanamori (Coll. of Liberal Arts, Kobe Univ., Kobe, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1037-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
A magnetic phase diagram for the triangular Ising lattice with nearest-neighbor and next-nearest-neighbor interactions, both being antiferromagnetic, is calculated within the molecular field approximation. It is shown that there appear several intermediate phases between low-temperature and paramagnetic phases for an appropriate range of external magnetic field. (3 refs.)
- 62655 Modulated structures of an Ising spin system on a triangular lattice.** K.Nakanishi (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1039-40 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
Mean field calculations are performed to study an Ising spin system on a triangular (hexagonal) lattice. An infinite number of long-period modulated structures are shown to be stable in a wide temperature region. The stabilization mechanism of the modulated structures is discussed in terms of domain boundaries. (4 refs.)
- 62656 Monte Carlo simulation of a triangular Ising lattice.** K.Wada, H.Takayama, T.Ishikawa (Dept. of Phys., Hokkaido Univ., Sapporo, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1043-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
A Monte Carlo study has been made on a triangular Ising lattice with antiferromagnetic nearest neighbor and ferromagnetic next nearest neighbor interactions. The authors data suggest that a new phase may exist in the system, which is a generalization of the partially disordered antiferromagnetism associated with the sublattice switching. (4 refs.)
- 62657 Longitudinal spectra of classical ferromagnetic chains in a magnetic field.** U.Balucani, V.Tognetti (Istituto di Elettronica Quantistica, CNR, Firenze, Italy), A.Rettori. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1231-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
Recent computer experiments in classical ferromagnetic chains in a field have indicated that entirely new structures appear in the longitudinal spectra at finite temperatures. The authors show that all these dynamical features reflect a tendency toward a quasi-isotropic behaviour determined by a thermally induced spin-energy coupling. (5 refs.)
- 62658 Monte Carlo calculations of phase diagrams of Ising systems with competing interactions.** K.Binder, W.Kinzel, W.Selke (Inst. für Festkörperforschung, KFA Jülich, Jülich, Germany). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1445-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
FCC antiferromagnets with nearest (J_{nn}) and next-nearest neighbour exchange (J_{nnn}) in a field H are studied by Monte Carlo methods. For $J_{nnn}=0$, $H=H_c=4|J_{nn}|$ the 'fully frustrated' system stays always disordered. In a centered rectangular lattice, layered structures (2×1), (3×1) and an incommensurate phase are found. (8 refs.)
- 62659 Existence or non-existence of the ferromagnetic phase in the random-bond Ising model with competing interactions.** T.Horiguchi, T.Morita (Dept. of Engng. Sci., Tohoku Univ., Sendai, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1449-50 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
For a $\pm J$ Ising spin glass model on a square lattice, the authors give a sufficient condition for existence or for non-existence of the ferromagnetic phase. An upper and a lower bound to the critical concentration are 0.974 and $1/\sqrt{2}$, respectively. They give a physical interpretation to the obtained lower bound. (7 refs.)
- 62660 A quenched bond-mixed Ising model: Ferromagnetic phase stability limit.** E.F.Sarmiento (Dept. de Física, Univ. Federal de Alagoas, Maceio, Brazil), C.Tsallis, I.P.Fittipaldi. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1451-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
Within the framework of an effective field theory the authors discuss the ferromagnetic phase stability limit of a quenched bond-mixed spin $1/2$ Ising model in a simple cubic lattice. Whenever comparison is possible a satisfactory qualitative and to a certain extent quantitative agreement is observed. (4 refs.)
- 62661 Random-bond Ising system in the external magnetic field.** N.Miyamoto, S.Katsura (Dept. of Appl. Phys., Tohoku Univ., Sendai, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1459-60 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
The magnetization process and the distribution of the internal fields of the $\pm J$ model are treated by the pair approximation. The magnetization curves are shown to have several steps. A spin glass parameter for the random system under the external field is proposed and calculated at absolute zero. (5 refs.)
- 62662 Some rigorous results on the phase diagram of the dilute Ising model.** E.Olivieri, J.F.Perez, S.Goulart Rosa, Jr. (Istituto Matematico, Univ. di Roma, Rome, Italy). *Phys. Lett. A (Netherlands)*, vol.94A, no.6-7, p.309-11 (21 March 1983).
The authors consider bond dilute ferromagnetic systems and by using extended versions of correlation inequalities they prove the existence of a phase (below the critical temperature of the regular model) with nonanalytic behaviour, but with exponential clustering and zero magnetization. (9 refs.)
- 62663 Hidden Mattis phase in annealed system.** Y.Kasai, A.Okiji (Dept. of Appl. Phys., Osaka Univ., Suita, Japan). *Prog. Theor. Phys. (Japan)*, vol.69, no.1, p.20-31 (Jan. 1983).
The annealed Ising-spin system with competing exchange interactions (J and $-af$) is considered to have a Mattis-type ordered phase. This ordered phase is expected to show the critical slowing down although the free energy has no singularity at T_c . So, the authors call it the hidden Mattis phase. Further, the phase diagram (concentration vs. temperature) in this system exhibits a resemblance to that obtained approximately in the quenched system with the spin glasslike phase. (31 refs.)
- 62664 Investigation of Oguchi's procedure applied to the Ising model.** J.R.Faleiro Ferreira, N.P.Silva (Dept. de Física, Univ. Federal de Minas Gerais, Belo Horizonte, Brazil). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.155-62 (1 March 1983).
Approximate critical temperature of the anisotropic ferromagnetic Ising model is calculated using the procedure proposed by Oguchi (see Progr. Theor. Phys., vol.56, p.1442, 1976), with better results than those obtained by the use of Bogolyubov's principle. The calculation is made with linear and double chain trial Hamiltonians. (3 refs.)
- 62665 Exact solution of a one-dimensional Ising model in a random magnetic field.** G.Grinstein (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), D.Mukamel. *Phys. Rev. B (USA)*, vol.27, no.7, p.4503-6 (1 April 1983).
Analytic results for the free energy, magnetic structure factor, and Edwards-Anderson order parameter of a one-dimensional ferromagnetic Ising model in a random magnetic field are obtained. The structure factor consists of both Lorentzian and Lorentzian-squared terms at all temperatures (T) greater than zero; the Lorentzian-squared terms vanish at $T=0$. The calculated correlation length agrees with predictions of the Imry-Ma domain argument. (10 refs.)

- 62666** Equivalence of statistical-mechanical and dynamic descriptions of the infinite-range Ising spin-glass. C.Dasgupta (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA), H.Sompolinsky. *Phys. Rev. B (USA)*, vol.27, no.7, p.4511-14 (1 April 1983). The authors prove the equivalence between the dynamic mean-field theory of the Ising spin-glass and the statistical-mechanical theory of Thouless, Anderson, and Palmer (TAP). Individual low-free-energy TAP solutions describe short-time properties, whereas thermodynamic equilibrium corresponds to averaging over all such solutions. The square of the staggered magnetization associated with the largest eigenvalue of the interaction matrix scales as $N^{5/6}$ (N is the number of spins). Results are confirmed by Monte Carlo simulation and numerical solution of the TAP equations. (12 refs.)
- 62667** Critical singularities of the random two-dimensional Ising model. Giancarlo Jug (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England). *Phys. Rev. B (USA)*, vol.27, no.7, p.4518-21 (1 April 1983). The critical properties of random ferromagnets with pure specific-heat exponent $\alpha_s=0$ are analyzed using renormalization-group methods. The origin and form of the impurity-induced logarithmic corrections for the random two-dimensional Ising model are discussed. Corrections develop only for the specific heat, which presents a new singularity of the $|\ln|T-T_c||^{1-\mu}$ as well as a heat critical exponent μ . (9 refs.)
- 62668** High-temperature path method for a two-dimensional random Ising model. D.Merlini (Math. Inst., Ruhr-Univ. Bochum, Bochum, Germany). Stochastic Processes in Quantum Theory and Statistical Physics. Proceedings of the International Workshop, Marseille, France, 29 June-4 July 1981 (Berlin, Germany: Springer-Verlag 1982), p.274-80. Develops a rigorous compact formulation of the high-temperature cluster expansion for a two-dimensional random Ising model and investigates the critical temperature of the model by the simple ratio method frequently employed in non-random spin systems. For a special class of a spin glass, it is found that the critical temperature is a monotonic decreasing function of the parameter describing the rate of disorder which varies from T_c (the Ising critical temperature) to $T=0$ (symmetric case). (13 refs.)

75.40F Heisenberg and other quantized spin models

- 62669** Spin-flop-paramagnetic phase transition. K.Muramatsu (Dept. of Phys., Tokyo Inst. of Technol., Tokyo, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1075-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). A spin wave theory predicts that the SF-P transition of the Heisenberg antiferromagnet is to be of first order. Even in the zero anisotropy limit a non-zero excitation gap in the SF phase is found. These are discussed in terms of the $1/S$ expansion. The movement of spins in the $k=0$ mode is also considered. (2 refs.)
- 62670** On the two-dimensionality of $\text{Fe}(\text{HCOO})_2 \cdot 2\text{H}_2\text{O}$. I.Kimura, T.Idogaki (Dept. of Phys., Fukuoka Univ. of Education, Fukuoka, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1199-200 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). With the use of decoration iteration transformation method, the effective coupling J between the successive A-planes of $\text{Fe}(\text{HCOO})_2 \cdot 2\text{H}_2\text{O}$ is calculated. It is shown that J tends to zero as $T \rightarrow 0\text{K}$ and the two-dimensionality becomes more remarkable. (3 refs.)
- 62671** Energy fluctuations at a linear Heisenberg ferromagnet. V.Tognetti, U.Balucani (Istituto di Elettronica Quantistica, CNR, Firenze, Italy), A.Rettori, J.M.Loveluck, E.Balcar. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1227-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). The exchange energy fluctuations of the classical Heisenberg chain with an applied field are theoretically studied by a nonperturbative interacting-boson theory. Computer simulations are also presented at different wavevectors and found in satisfactory agreement. (6 refs.)
- 62672** Calculated specific heat and susceptibility for the crossover of an $S=\infty$ Heisenberg antiferromagnet compared with data on $\text{Rb}_2\text{FeCl}_4 \cdot \text{H}_2\text{O}$. J.A.Puertolas, R.Navarro (Dept. of Phys., ETSII, Univ. of Zaragoza, Zaragoza, Spain), F.Palacio, J.Bartolome, D.Gonzalez, R.L.Carlin. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1243-5 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). Predictions for the thermodynamic behaviour of the $S=\infty$ Heisenberg antiferromagnet with two exchange interactions, J_1 and J_2 , for the SC net are obtained from Padé approximant analysis of the high temperature series. The results have been used to fit the data of $\text{Rb}_2\text{FeCl}_4 \cdot \text{H}_2\text{O}$. (8 refs.)
- 62673** Heisenberg spin glasses with uniaxial anisotropy. D.Sherrington, D.M.Cragg, D.J.Elderfield (Phys. Dept., Imperial Coll., London, England). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1417-18 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). It is shown that the addition of local uniaxial anisotropy and magnetic fields to an exchange-isotropic vector spin glass model yields a system with a phase space of great richness, offering potential for a much improved probing of the basic spin glass problem. (8 refs.)
- 62674** Nonlinear field theory of large-spin Heisenberg antiferromagnets: semiclassically quantized solitons of the one-dimensional easy-axis Neel state. F.D.M.Haldane (Dept. of Phys., Univ. of Southern California, Los Angeles, CA, USA). *Phys. Rev. Lett. (USA)*, vol.50, no.15, p.1153-6 (11 April 1983). The continuum field theory describing the low-energy dynamics of the large-spin one-dimensional Heisenberg antiferromagnet is found to be the $\text{O}(3)$ nonlinear sigma model. When weak easy-axis anisotropy is present, soliton solutions of the equations of motion are obtained and semiclassically quantized. Integer and half-integer spin systems are distinguished. (10 refs.)

- 62675** Reaction field approximation for inhomogeneous ferromagnets. L.Wojtczak, T.Balcerzak (Dept. of Solid State Phys., Univ. of Lodz, Lodz, Poland). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.217-25 (1 March 1983). The reaction field approximation method for inhomogeneous magnetic systems is extended. The Curie temperature of inhomogeneous samples is calculated on the basis of perturbation theory. As a result the shift of the Curie temperature is obtained with respect to the value of the Curie temperature for an effective crystalline structure. A comparison of the results with those following from other methods shows that the accuracy of the presented method is the same as the cluster method and is much better than the molecular field approximation. (15 refs.)
- 62676** A binary ferromagnetic alloy with magnetic moments dependent on local environment. I. The Jaccarino-Walker model in the effective field approximation. A.V.Zaborov (Dept. of Phys., Ural Polytech. Inst., Sverdlovsk, USSR), M.V.Medvedev. *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.227-38 (1 March 1983). A binary ferromagnetic alloy, in which the magnetic moments depend on their local chemical environment in a step-like manner (the Jaccarino-Walker model), is considered. It is assumed that Heisenberg exchange interactions of the nearest neighbours are responsible for the ferromagnetic ordering of these magnetic moments. Both the Curie temperatures versus concentration and the percolation thresholds of the existence of the long-range magnetic order are investigated for different variants of dependences of both the magnetic components on their local environments. The spin-wave spectrum is analyzed as well. (17 refs.)
- 62677** The Heisenberg model: dynamical interactions including odd-boson terms. C.A.M.Mulder (Kamerlingh Onnes Lab., Rijksuniv. Leiden, Leiden, Netherlands), H.W.Capel. *Physica B & C (Netherlands)*, vol.115 B+C, no.3, p.310-38 (March 1983). A systematic treatment is given of a rather general spin-wave Hamiltonian containing up to four-boson terms. The linear boson terms of leading order in the $1/S$ expansion disappear, applying an appropriate boson shift of rotation in spin space prior to the Holstein-Primakoff transformation. The remaining one- and all three-boson terms are eliminated using a Frohlich transformation which yields an effective Hamiltonian consisting of two- and four-boson terms apart from a constant. The free energy corresponding to this Hamiltonian is obtained using a variational type of approach. (29 refs.)

- 62678** Relative linearisation of current-carrying ferrous media in orthogonal magnetic fields. V.N.Ostreiko, Yu.L.Chernikov. *Izv. VUZ Elektromekh. (USSR)*, no.1, p.36-43 (Jan. 1983). In Russian. An analysis shows that in a multilayer ferrous medium, whose intrinsic magnetic field is orthogonal to the lateral magnetic field, the permeabilities of the layers may be determined, over a large range of flux density variations, from the corresponding magnetic curves on the basis of the lateral field only. From tabulated results of numerical experiments it follows that, by employing relative linearisation of the current-carrying medium, the error of calculating the magnetic induction is 1.5-2 times greater than the errors of calculating the flux and the inductance. When changing from weak to strong fields, the error changes sign. (8 refs.) Z.F.V.
- 62679** Experimental study of losses in cold-rolled steel using unidirectional periodic magnetisation. V.V.Vorob'ev, A.N.Tkachev. *Izv. VUZ Elektromekh. (USSR)*, no.1, p.134-8 (Jan. 1983). In Russian. An account is given of an experimental investigation of the effects of direction and the temporal shape of the magnetic induction, on losses in cold-rolled steel, at the magnetisation frequency of 50Hz. Measurements were made in eight directions of magnetisation, from 0 to 90 degrees to the direction of the rolling. Data were obtained for the losses in the steel, induction and intensity maxima, the form factor for the induction derivative, the dynamic hysteresis loops, and oscillography were taken for the induction and intensity on the surface of the packet. It is shown that for an arbitrary unidirectional magnetisation, the losses can be described by three generalised characteristics of the material. (6 refs.) Z.F.V.
- 62680** Calculation of the electromagnetism field and surface loss in a ferromagnetic plate using the straight line method. I.I.Yurtin. *Tekh. Elektrodin. (USSR)*, no.1, p.96-100 (Jan.-Feb. 1983). In Russian. The straight line method is used to obtain an approximate solution of the problem of determination of the electromagnetism field and mean value of surface loss in a ferromagnetic plate situated in an external uniform magnetic field. 75.60C Domain walls and domain structure (for magnetic bubbles, see 75.70K)

- 62681 A new method of domain structure investigation at temperatures below 35K. A.Szewczyk, K.Piotrowski, R.Szymczak (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland). *J. Phys. D (GB)*, vol.16, no.4, p.687-96 (14 April 1983).
A new method of Bitter pattern formation in the temperature range from 5K to 35K has been developed. The domain walls have been made visible by fined solid oxygen particles produced in the process of gaseous oxygen cooling in a helium atmosphere. The presented method is particularly useful for low temperature investigations of bulk materials. Photographs of Bitter patterns obtained at 6K for a YFeO_3 orthoferrite plate and a $\text{BaFe}_{12}\text{O}_{19}$ bulk crystal are shown. (14 refs.)
- 62682 Direct observation of the interaction between magnetic domain walls and dislocations in iron. R.A.Taylor, J.P.Jakubovics (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England), B.Astie, J.Degaque. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.970-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
The influence of dislocations on magnetisation processes in iron has been investigated by high voltage Lorentz microscopy. The dominant interaction between magnetic domain walls and dislocations changes with increasing strain level. Thin foil coercivities vary from 0.5 to 3 Oe for strain levels 0.6 to 16.4% respectively. (5 refs.)
- 62683 Magnetic domains in HCP and DHCP Co-Fe alloys studied by 1 MV Lorentz electron microscopy. D.Watanabe, T.Sekiguchi (Dept. of Phys., Faculty of Sci., Tohoku Univ., Sendai, Japan), T.Tanaka, M.Takahashi, T.Wakiyama, M.Takahashi. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.973-5 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
Domain structures in the Co-alloys with 0.8-1.2 at.% Fe were examined, and fine structure of the 180° wall in the dhcp phase and domain configuration at the interface between hcp and dhcp phases were revealed. The temperature dependence of the domain structure was also studied. (4 refs.)
- 62684 A new method for the study of magnetic domains at low temperatures. K.Piotrowski, A.Szewczyk, R.Szymczak (Inst. of Phys., Acad. of Sci., Warsaw, Poland). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.979-80 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
In this paper a new method is presented for obtaining Bitter patterns in bulk materials. As magnetic particles, active in forming of the domain patterns, the authors have used solid oxygen in temperature range between 5 and 35K. The observations of domain structures have been performed in YFeO_3 thin plate and $\text{BaFe}_{12}\text{O}_{19}$ and $\text{PbFe}_{12}\text{O}_{19}$ bulk crystals. The Bitter patterns obtained are presented in the photographs. (6 refs.)
- 62685 Magnetic charge effects in ion implanted garnets. H.Jouve, P.Pouget (LETI, CEA, Grenoble, France). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.981-3 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
This paper describes a careful characterization of the static and dynamic properties of bubbles along a border defined by ion implantation. The data are dependent on the direction and the magnitude of an in-plane magnetic field. The results are interpreted as being due to the existence of magnetic charges appearing along the border of the implanted zone. (4 refs.)
- 62686 Observation of the Villain mode in CsCoBr_3 . S.E.Nagler, W.J.L.Buyers, R.L.Armstrong (AECL, Chalk River Nuclear Labs., Chalk River, Ontario, Canada), B.Brait. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1213-14 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
Neutron scattering experiments in CsCoBr_3 have shown that domain walls propagate along Ising-like antiferromagnetic chains so as to give rise to a characteristic inelastic collective peak in the spin response. The dispersion of the peak frequency agrees with the predictions of Villain (1975). The line-shape of the peak is found to be a sensitive test of collisions between the walls. (6 refs.)
- 62687 Influence of the viscosity field on the power losses in amorphous magnetic alloys. M.Celasco, A.Masero, P.Mazzetti, A.Stepanescu (Istituto Elettrotecnico Nazionale Galileo Ferraris, Torino, Italy). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1407-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
Thermal annealing of an amorphous alloy showing large viscosity field effects, as Metglas 2826, produces a strong reduction of the dynamic loss, probably related to a corresponding reduction of the viscosity field. The effect is not related to changes in the magnetic domain structure due to the anisotropy induced when the material is annealed under magnetic field, but seems to be simply related to a stabilization of the amorphous atomic structure. (5 refs.)
- 62688 A theory of internal stress field and configuration of magnetic domain in amorphous ribbons. Zhao-hua Lin, Dao-sheng Dai (Dept. of Phys., Peking Univ., Beijing, China). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1540-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
The distribution of the internal stress fields of different regions in an amorphous ribbon are found, and the magnetic anisotropies in these regions are also calculated. On the basis of these results the authors could easily understand the various configurations of domain structure and some experimental phenomena of domain observation of the amorphous ribbons. (3 refs.)
- 62689 Neutron depolarization in the unannealed amorphous ribbon Metglas 2826. M.Th.Rekvelid, T.G.Spanjer (Interuniv. Reactor Inst., Delft, Netherlands). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1585-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).
Three dimensional neutron depolarization experiments have been carried out on an amorphous unannealed ribbon Metglas 2826 of dimensions $(50 \times 12.8 \times 0.047)\text{mm}^3$ in the presence of a magnetic field and a mechanical tension along the ribbon direction. Using a magnetic model for the domain structure, four parameters characterizing this model can be determined from the depolarization experiments. From this analysis the internal stress has been determined as a function of the depth. (6 refs.)

62690 Micromagnetics of zigzag head-on domain walls. R.F.Soochoo (Dept. of Electrical & Computer Engng., Univ. of California, Davis, CA, USA).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.261-2 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The boundary between two domains of head-on magnetization, as occurred in digital recording has been observed to be zigzag in shape and the transition region carries a net charge. A method has been developed to calculate, with no approximations, the complex magnetization distribution within this transition region. (8 refs.)

62691 Evidence for very-large-area magnetic domain walls in haematite (α -Fe₂O₃). G.F.Clark, P.A.Goddard, J.R.S.Nicholson, B.K.Tanner (Dept. of Phys., Durham Univ., Durham, England), B.M.Wanklyn.

Philos. Mag. B (GB), vol.47, no.3, p.307-13 (March 1983). Magnetic domain walls up to approximately 20 nm² in area have been identified in thin basal plane platelets of the weak ferromagnet α -Fe₂O₃ using synchrotron radiation X-ray topography. The behaviour of these basal plane wall under small magnetic fields was examined in real time using the Daresbury X-ray imaging system. Area contrast is exhibited by the walls in white radiation X-ray topographs. (13 refs.)

62692 Stability and spectrum of the domain strip-structure oscillation of ferromagnets. V.G.Baryakhtar, Yu.I.Gorobets, S.I.Denisov.

Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.436-40 (March 1983). In Russian. The spectrum of the domain strip-structure oscillation has been studied in one-axis ferromagnets. It is shown that in the presence of a bias field the spectrum consists of two branches with a fissure between them. A criterion is obtained for the DSS stability relative to the long-wave deformation of the form of the domain borders which are homogeneous in the plate thickness. (10 refs.)

62693 The spontaneous magnetization of nickel. G.H.Czerlinski (Biochem. & Biophys. Programs, Northwestern Univ., Chicago, IL, USA).

J. Biol. Phys. (USA), vol.10, no.4, p.189-98 (1982).

The original data of Weiss and Forrer on nickel (Ann. Phys. Paris, vol.5, p.153-213, 1926) are reanalyzed with the aim to obtain a simple empirical relation between the spontaneous magnetization and the temperature both below and above the Curie temperature. A simple relation between the spontaneous magnetization and the temperature is needed to separate easily between the ferromagnetic and the paramagnetic region in the plane given by temperature and field strength, needed for a comprehensive treatment of the magnetocaloric effect (compare *ibid.*, vol.9, p.27, 1981). Various methods of extrapolating to zero magnetic field strength are discussed and used to obtain specified values for the spontaneous magnetization at various temperatures. Starting with a simple expression of cooperativity among elements it is shown that a sufficiently good fit of models to the given data is only obtained with the assumption of three types of cooperativity differing in the intensity of coupling. This intensity of coupling is signified by the magnitude of the exponent in the independent variable (temperature). (16 refs.)

62694 Mechanism of formation of magnetic properties of amorphous alloy Fe₂₀Co₇₀Si₁₀B₁₀ during annealing. I.B.Kekalo, V.L.Stolyarov, V.Yu.Tsvetkov (Inst. of Steel & Alloys, Moscow, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.235-42 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A study was made of the influence of low-temperature annealing on the magnetic properties of amorphous Fe₂₀Co₇₀Si₁₀B₁₀ in two states: after quenching from the melt and after a preliminary annealing at 410°C. The influence of the rate of cooling after this low-temperature annealing on the magnetic properties and the temperature dependences of the magnetic properties recorded during heating and cooling indicated that two processes occurring during annealing determined the magnetic properties: stabilization of domain walls by an induced local anisotropy and irreversible structural relaxation. Conditions for achieving good magnetic properties of amorphous alloys of the investigated type were formulated and it was found that in the case of Fe₂₀Co₇₀Si₁₀B₁₀ the following properties were achieved without annealing in a magnetic field: $H_c = 4$ mOe, $\mu_i = 40000$, and $\mu_{max} = 1100000$. (14 refs.) A.T.

62695 Magnetic and electrical properties of FeCr_{2-x}In_xS₄ (0 ≤ x ≤ 1). R.Z.Sadykhov, L.M.Valiev, I.G.Kerimov, A.A.Abdurragimov, A.D.Namazov (Inst. of Phys., Acad. of Sci., Azerbaizhdzhan SSR).

Inorg. Mater. (USA), vol.18, no.5, p.628-30 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.742-4 (May 1982). [received: Feb. 1983]

It was found that solid solutions of FeCr_{2-x}In_xS₄ (0 ≤ x ≤ 1), like the initial compound FeCr₂S₄, exhibit ferrimagnetic properties and have semiconductor type conductivity. (5 refs.)

62696 Reversible permeability for perpendicularly superposed induction for Fe₉₀Ni₁₀P₁₄B₆ amorphous ribbon and its magnetisation process. M.Teodoro, B.Hernando (Dept. de Física, Facultad de Ciencias, Univ. de Oviedo, Oviedo, Spain).

J. Phys. D (GB), vol.16, no.4, p.L85-7 (14 April 1983).

Measurements of the reversible permeability for perpendicularly superposed induction have been made in tape-wound cores of Fe₉₀Ni₁₀P₁₄B₆ amorphous ribbons. The results obtained show an increase of the permeability followed by a decrease, that reveals important magnetisation rotation processes in these materials. (7 refs.)

62697 Magnetization process of GdNi single crystal in the high magnetic field near the Curie temperature. Y.Isikawa, K.Higashi, T.Miyazaki, K.Sato (Coll. Liberal Arts, Toyama Univ., Toyama, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1057-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The magnetizations of the rare earth intermetallic compound GdNi single crystal were measured in pulsed high magnetic fields up to 160 kOe near the Curie temperature. The critical exponents of β and γ were estimated to be 1/3 and 2 on the bases of the Arrott plots, respectively. (4 refs.)

62698 Polarised neutron study of Mn_{1/4}Ta_{3/4}S₂: observation of conduction electron spin polarisation. S.S.Parkin, E.A.Marsaglia (Cavendish Lab., Univ. of Cambridge, Cambridge, England), P.J.Brown.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1207-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

A polarised neutron study to determine the magnetisation density distribution in the metallic layered compound Mn_{1/4}Ta_{3/4}S₂ has been made. Although the magnetisation is principally localised on the Mn sites a significant spin polarisation of the conduction electrons was measured, suggesting that the exchange interaction between the Mn moments is of the RKKY type. (6 refs.)

62699 Anomalous temperature dependence of magnetization in amorphous (Fe_{0.9}Ni_{0.97}Si_{0.03})₈₀B₂₀ alloy. M.Takahashi, I.Okamoto, T.Miyazaki (Dept. of Appl. Phys., Tohoku Univ., Sendai, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1399-400 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The temperature and magnetic field dependence of DC magnetization σ and AC susceptibility χ_{AC} were investigated for an amorphous (Fe_{0.9}Ni_{0.97}Si_{0.03})₈₀B₂₀ alloy to clarify the origin of the inflection of χ_{AC} vs. T curves observed at low temperatures. The results are discussed based upon the magnetic cluster model. (8 refs.)

62700 Low field properties of FeNiMnB amorphous alloy. Bingrong Zhang (Dept. of Phys., Nanjing Univ., Nanjing, China), Hongru Zhai, Songyao Shi, Qingzheng Xu.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1565-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Low field properties of FeNiMnB amorphous alloy with $\lambda = 10^{-5}$ have been studied. High temperature thermomagnetic treatment followed by transverse TMT was found to reduce both the stress anisotropy and the induced anisotropy and eliminate pinning defects efficiently, thus improving the low field properties. A value of $\mu_0 = 10^4$ has been obtained. (2 refs.)

62701 Magnetic inhomogeneity in amorphous Fe-Zr alloys. H.Yamamoto, H.Onodera, K.Hosoyama, T.Masumoto, H.Yamauchi (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1579-80 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Magnetic properties of amorphous Fe₇₀Zr₃₀ and Fe₉₀Zr₁₀ alloys have been studied by ⁵⁷Fe Mossbauer and magnetization measurements. The magnetic hyperfine field distribution spreads over a wide range and the temperature dependence of the hyperfine fields shows magnetically heterogeneous behaviour. Superparamagnetic behavior was observed on the magnetization curves above T_c . (7 refs.)

62702 Quantitative determination of magnetisation distributions in domains and domain walls by scanning transmission electron microscopy. J.N.Chapman, G.R.Morrison (Dept. of Natural Philosophy, Univ. of Glasgow, Glasgow, Scotland).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.254-60 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

Most modes of Lorentz microscopy in the transmission electron microscope yield results which are difficult to interpret quantitatively. The authors describe a new technique, differential phase contrast electron microscopy, which is well suited to the determination of both the magnetisation direction within domains and the spatial variation of the magnetisation in domain walls, the latter being averaged through the foil thickness. The mode of image formation and interpretation of images are discussed together with details of instrumental requirements. Finally results from a few magnetic elements and alloys are presented. (14 refs.)

62703 Magnetic hysteresis and minor loops: models and experiments. J.A.Barker, D.Schreiber, B.G.Huth (IBM Res. Lab., San Jose, CA, USA), D.H.Everett.

Proc. R. Soc. London Ser. A (GB), vol.386, no.1791, p.251-61 (8 April 1983). The features of minor loop behaviour in magnetic hysteresis are examined by comparing some experimental data on a Mn-Al-Ge film with two phenomenological models. The 'independent particle' model of Preisach and Everett proves to describe qualitatively all the observed behaviour. This model is generalized slightly to allow for the interaction of the 'particle' through an average demagnetizing field, and a convenient method for calculating the consequences of the model is described. (18 refs.)

62704 Effect of fabrication condition on the magnetic properties of Fe-Mn-B system amorphous alloys. S.Arai, M.Nagakura.

Res. Rep. Fac. Eng. Meiji Univ. (Japan), no.43, p.13-17 (1982). In Japanese. The effect of fabrication condition on magnetic properties of Fe-Mn-B ternary amorphous alloys are studied. Amorphous ribbons are prepared by melt quenching onto the surface of a rotating steel or copper roller. It is found

that the samples made by steel roller possess higher saturation magnetization than those made copper roller. However, the crystallization temperature of the samples obtained by copper roller is higher than that of those made by steel roller. A difference in Curie temperature is not observed for samples prepared by either method. (8 refs.)

62705 Energy losses in electrical steel under rotational magnetic reversal. G.S.Korzunin, L.A.Inisheva. *Sov. Electr. Eng. (USA)*, vol.52, no.12, p.19-24 (1981). Translation of: *Elektrotehnika (USSR)*, vol.52, no.12, p.10-12 (1981). Results are reported for an experimental investigation into the way in which energy losses during rotational magnetic reversal of cold-rolled and hot-rolled electrical steels depends on magnetizing current at 10-70 Hz. It is shown that at 50 Hz cold-rolled steel of the best grade has higher losses under rotational magnetic reversal than under cyclic reversal. This is accounted for qualitatively by the higher losses to eddy currents under rotational magnetic reversal. (6 refs.)

62706 Long relaxation times in ferromagnets and their possible applications. B.M.Lebed', I.I.Marchik. *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.8, p.390-1 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.901-3 (Aug. 1982). [received: April 1983] Reports an experimental test of the slow relaxation in ferromagnets employing the 'rejuvenation' effect in which the original magnetic state of the ferromagnet is restored by annealing it at a temperature above the magnetic phase transition temperature. Measurements of the time dependence of the initial magnetic permeability of ferrites are presented, and applications to magnetic bearing rock are briefly discussed. (5 refs.)

75.60G High coercivity materials

62707 Remagnetisation phenomena in multicomponent rare-earth-cobalt alloys with increased temperature stability. D.D.Mishin, A.A.Lukin, N.P.Suponev, A.G.Pasushenkov, V.V.Levandovsky, M.B.Lyakhova. *Russ. Metall. (GB)*, no.6, p.179-81 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.184-5 (1981).

Multicomponent alloys of type Sm-Zr-Co-Cu-Fe with partial substitution of samarium by heavy r.e.m. are suitable for cast and sintered permanent magnets with an enhanced temperature stability. The mechanism of the coercive force in the cast and in the sintered state is due to the braking of the displacement of the domain boundaries by lattice defects uniformly distributed throughout the volume. (5 refs.)

62708 Statistical evaluation of basic parameters of cast magnetically hard materials. V.B.Ivanov.

Sov. Electr. Eng. (USA), vol.52, no.10, p.79-84 (1981). Translation of: *Elektrotehnika (USSR)*, vol.52, no.10, p.37-9 (1981).

A method is presented and results reported of a statistical investigation aimed at determining several quality characteristics for fundamental magnetic parameters: limiting values, tolerance, coordinate of tolerance-field center, relative coefficient of asymmetry, etc. (12 refs.)

62709 The inversion magnet: a new type of permanent magnet. A.V.Deryagin, N.V.Kudrevatykh, E.N.Tarasov (A.M. Gorkii Ural State Univ., Sverdlovsk, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.7, p.370-1 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.856-8 (July 1982).

[received: April 1983] In a search for materials with a high coercive field over a broad temperature range T_1 - T_2 and with a high negative magnetization, and in an effort to develop permanent inversion magnets from these materials, the authors have studied the magnetic properties of the intermetallic compounds of thulium with cobalt TmCo_5 and Tm_2Co_7 . The alloys were produced by zone charging in an induction furnace in an atmosphere of pure helium, followed by a homogenizing at 1000°C for 100 h. (1 ref.)

62710 Magnetic properties of amorphous powders of alloy Mn_3B_4 . V.I.Timoshchuk, K.B.Vlasov, A.E.Ermakov, V.A.Barinov (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.263-6 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* A study was made of the effects of strong mechanical crushing on the magnetic properties of layer antiferromagnet Mn_3B_4 ($T_N=403\text{K}$). The long-range atomic order was destroyed by sufficiently long crushing and the alloy assumed an amorphous state characterized by a spontaneous magnetization σ_0 . The effective Curie temperature was now $T_C \approx 250\text{K}$. The phase transition at T_C was strongly broadened on the temperature scale. The value of σ_0 was much less than the magnetization of the original antiferromagnetic alloy in fields sufficient to cause collapse of the antiferromagnetic sublattices, which

was attributed to the presence of an asperomagnetic structure in the amorphous state. (9 refs.) A.T.

62711 The orientation of magnetic particles for high density recording. K.Sumiya, S.Watatsani, F.Hayama (Dept. of Tech. Res., Hitachi Maxell Ltd., Kyoto, Japan), K.Nakamae, T.Matsumoto. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.937-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). The behavior of magnetic orientation of acicular α -Fe particles in paints and coatings was investigated. The high orientation of particles can be achieved by a new process line including a magnet for orientation, a solenoid for holding the orientation, and a hot air line for drying immediately. (1 ref.)

62712 Effect of heat-treatment on magnetic properties and morphology of iron particles. T.Sueyoshi, K.Tashita, S.Hirai, Y.Hayashi, M.Amamiya (Hitachi Maxell Ltd., Kyoto, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.939-30 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). Marked inhibition effect of surface coated silica on the crystal growth of hematite particles in the process of heat-treatment of goethite particles was reduced by the addition of calcium hydroxide to the silica-coat on the surface of goethite particles. Coercivity of iron particles, prepared by reduction of the hematite particles, significantly decreased with increase in crystallite size of iron particles. (4 refs.)

62713 The shape anisotropy of metal powder on magnetism. S.Suzuki, H.Sakumoto, Y.Omote (Res. & Dev. Center, Kanto Denka Kogyo Co. Ltd., Gunma, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.941-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). The shape anisotropy effect on the magnetism of the acicular Fe-Co alloy powder has been investigated. The effect in the coercivity was nearly 10%. Therefore, the coercivity was affected mainly by the size of the single unit particles which composed the shape of the alloy powder. (3 refs.)

62714 Time variation of coercivity in cobalt-contained iron oxides particles. M.Kishimoto, S.Kitaoaka, H.Andoh, M.Amamiya (Hitachi Maxwell Ltd., Kyoto, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.943-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). A variation of coercivity in annealing was examined for two different types of cobalt-contained iron oxide particles. The increase of coercivity by annealing cobalt substituted iron oxides was caused by the induced magnetic anisotropy. The stable coercivity of cobalt-epitaxial iron oxides resulted from the long relaxation time of the cobalt-ferrite crystallized on the oxides. (5 refs.)

62715 A theory of correlations in a magnetically aligned ferrofluid. R.Pynn, J.B.Hayter (Inst. Laue-Langevin, Grenoble, France). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.955-7 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). The authors have obtained an analytic form for the structure factor of a colloidal ferrofluid in which the particle moments are completely aligned by an applied magnetic field. The results obtained show the particle chaining first proposed by de Gennes and Pincus (1970). (9 refs.)

62716 Curie-Weiss behavior in ferrofluids. K.O'Grady, A.Bradbury, S.W.Charles, S.Menear, J.Popplewell (Univ. Coll. of North Wales, Bangor, Wales), R.W.Chantrell. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.958-60 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). Curie-Weiss behavior has been shown for magnetic liquids containing cobalt particles diameter $D_{vm}=27$ Å (sample A) and $D_{vm}=96$ Å (sample B). Values for an internal field of 650 Oe and 100 Oe have been calculated for samples A and B respectively which is interpreted in terms of interparticle interactions Monte Carlo calculations give some justification for this approach. (5 refs.)

62717 Surface magnetic properties of fine particles. A.H.Morrish, K.Haneda (Dept. of Phys., Univ. of Manitoba, Winnipeg, Manitoba, Canada). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.105-13 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Fine particles offer an attractive avenue for the study of the magnetic properties of surfaces. The use of small particles instead of thin films has some advantages. Although several experimental techniques can be employed profitably, Mossbauer spectroscopy is emphasized. The application of large magnetic fields has established that a noncollinear magnetic structure occurs in the surface layers of γ -Fe₂O₃, NiFe₂O₄, and CrO₂; the morphology of the particles appears to be important. Particles doped with Mossbauer isotopes, both throughout the volume and preferentially on the surface, provide additional useful information. Interfacial interactions and surface anisotropy are discussed. Some applications are considered. (39 refs.)

62718 Magnetic behavior of SmCo₅-hydrogen system. M.Yamaguchi, T.Ohta (Faculty of Engng., Yokohama Nat. Univ., Yokohama, Japan), Y.Osumi. *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.114-16 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The magnetization of the hydrides of activated SmCo₅ powder has been determined as a function of hydrogen pressure (less than 6 MPa) and composition, and temperature under the direct influence of hydrogen. The hydride phase transformation and the effect of hydrogen on the magnetic moment have been studied. (7 refs.)

62719 Dynamical properties of small particles; comparison with spin glass behaviour. J.L.Dormann (Lab. de Magnetisme, CNRS, Meudon-Bellevue, France), D.Fiorani, J.L.Tholence, C.Sella. *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.117-20 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Finely dispersed small iron particles in an amorphous alumina matrix are studied. AC susceptibility (17 Hz $\leq \nu \leq 11$ kHz), Mossbauer spectroscopy, magnetization, TRM and IRM measurements are performed. The time dependent properties are similar to those of spin glasses and are explained with the small particle model taking into account the interaction between particles. (9 refs.)

62720 Shape anisotropy of ultrafine magnesium ferrite precipitates. R.S.de Basi, T.C.Devezas (Secao de Engenharia e Ciencia dos Materiais, Inst. Militar de Engenharia, Rio de Janeiro, Brazil). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.121-2 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The temperature dependence of the resonance anisotropy field for a coherent assembly of ultrafine magnesium ferrite precipitates was investigated in the range 100-400K. The results are interpreted in terms of the shape anisotropy of the precipitates. (6 refs.)

75.60L Magnetic aftereffects

62721 Factors affecting the disaccommodations of amorphous magnetic materials. K.Shirai, M.Yamato (Faculty of Engng. Sci., Osaka Univ., Toyonaka, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1557-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). Disaccommodations of amorphous FeSiB are studied. With increase of the exciting frequency, the disaccommodation crosses zero and changes its sign thereafter. Tensile stress increases the disaccommodation, while compressive stress decreases it. A low Curie temperature means a low value of the disaccommodation. (3 refs.)

62722 After-effect of permeability and magnetic loss of an amorphous Co₇₅Fe₂₅B₂₀ alloy. S.Hatta, T.Mizoguchi (Faculty of Sci., Gakushuin Univ., Tokyo, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1559-60 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). Disaccommodation effects in the permeability μ and loss angle δ in an amorphous Co₇₅Fe₂₅B₂₀ alloy were measured simultaneously. Observed discontinuous drops in both μ and δ are supposed to result from wall motion pinning associated with the structural relaxation of defects in the amorphous phase. (5 refs.)

62723 Magnetic relaxation in amorphous (Fe_{1-x}Ni_x)₇₇Si₁₀B₁₃ alloys. T.Miyazaki, M.Takahashi (Faculty of Engng., Tohoku Univ., Sendai, Japan), K.Hisatake. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1583-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). Disaccommodation and magnetic annealing effects for amorphous (Fe_{1-x}Ni_x)₇₇Si₁₀B₁₃, $0 \leq x \leq 0.8$, alloys were studied to investigate the mechanism of structural relaxation. The structural relaxation is divided into two stages. The first stage, below 200°C, is caused by a movement of metalloid atoms and the second one, above 200°C, by diffusion of the alloy constituents. (7 refs.)

75.60N Magnetic annealing and temperature-hysteresis effects

62724 Effects of field annealing on the magnetic characteristics and magnetic losses of amorphous ribbons Fe₇₈Si₁₀B₁₂. Y.C.Kuo, L.S.Zhang, R.W.Gao (Phys. Dept., Shandong Univ., Jinan, China). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1563-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). The effects of magnetic annealing on the magnetic characteristics and magnetic losses of amorphous ribbons of Fe₇₈Si₁₀B₁₂ were studied. The annealing temperature was chosen at 400°C, this being lower than the Curie temperature, 440°C. A magnetic field of 30 Oe was applied during the heat treatment, in a direction at an angle θ to the length of the ribbon, with $\theta=0^\circ, 45^\circ, 60^\circ, 90^\circ$. The magnetic characteristics in AC fields were measured at frequencies from 50 Hz to 10 kHz. The total losses W were measured and resolved into the hysteresis loss W_h , the classical eddy current loss W_e , and the anomalous eddy current loss W_a . In general, at a given frequency and a given maximum induction, W_a decreases and W_e increases with the direction θ . So the optimum annealing conditions for lowest total loss are different for different frequency and maximum induction. (3 refs.)

Induced anisotropy in amorphous Co-P alloys See Entry 62582
Magnetic relaxation in amorphous (Fe_{1-x}Ni_x)₇₇Si₁₀B₁₃ alloys See Entry 62723

75.70 MAGNETIC FILMS AND PLATES

62725 Magnetic properties of granular films Fe-Al₂O₃. D.Fiorani (CNRS, Grenoble, France), J.L.Tholence, J.L.Dormann. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.947-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). The frequency dependence (17 Hz $\leq \nu \leq 2103$ Hz) of the blocking temperature T_B and the time and temperature evolution of the thermoremanent magnetization TRM of granular Fe-Al₂O₃ (46% Fe) films have been studied. These properties are characteristic of fine ferromagnetic grains. (3 refs.)

62726 Insoluble binary system thin film. M.Takao, H.Senno (Materials Res. Lab., Matsushita Electric Industrial Co. Ltd., Osaka, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.949-50 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). Insoluble binary amorphous Fe-Ag and FeCo-Ag or slightly soluble crystalline Fe-Cu films were co-deposited. It was established that they were crystallized or segregated after heat treatment. During the treatment, electrical resistivity

drastically decreased at 250°C and coercivity surprisingly increased up to 840 Oe as a result of the shape anisotropy. (7 refs.)

62727 FMR and magnetic studies in amorphous Co-Nb films. M.Tarhouni, R.Krishnan, M.Tessier, J.Sztern (Lab. de Magnetisme, CNRS, Meudon-Bellevue, France). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1581-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). Amorphous $\text{Co}_{1-x}\text{Nb}_x$ films have been prepared by co-evaporation in ultra high vacuum. $4\pi M_s$ decreases with an increase in x in a way similar to the case of Zr in spite of the higher valency of Nb. Nb over-coated films show a perpendicular anisotropy. The origin of this anisotropy and the effects of annealing are discussed. (9 refs.)

62728 Diffusion and magnetic properties of compositionally modulated films. N.S.Kazama, H.Fujimori (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.86-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Magnetization and interdiffusion measurements have been carried out on the compositionally modulated films $\text{Fe}_{80}\text{Co}_{20}/\text{Si}$. The magnetization and the Curie temperature have been significantly enhanced by the diffusion of Fe from FeC to Si for the films with a shorter modulation wavelength. On the contrary, for the longer modulation wavelength film, the ferromagnetism has been eliminated through the diffusion of Fe from Si to FeC. (8 refs.)

62729 Application of neutron diffraction to the study of interface magnetization on thin films with artificial superlattices. Y.Endoh (Dept. of Phys., Tohoku Univ., Sendai, Japan), N.Hosoi, T.Shinjo. *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.93-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Studies interface magnetization by applying the simple kinematical theory of neutron diffraction for the periodic stratified structure. In order to realize the principle, the authors made an artificial superstructure film consisting of bilayers of ferromagnetic versus nonmagnetic materials. They discuss the principle of the application of neutron diffraction, the experiments and the results. They also compare the results with the depth profile analysis of Mossbauer spectroscopy. (13 refs.)

62730 Magnetic property changes in epitaxial metal film sandwiches. M.B.Brodsky (Materials Sci. Div., Argonne Nat. Lab., Argonne, IL, USA). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.99-104 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Epitaxial metal film sandwiches (EMFS) containing Pd or Cr, have been prepared between single crystal Ag or Au. The modified Pd/Cr show major changes in physical properties. Pd has a stretched lattice parameter in Au-Pd-Au, which combines with a tetragonal distortion to cause exchange enhancements up to 28000 and spin fluctuation temperatures of 1-10K. In Au-Cr-Au, Cr takes up the FCC structure, leading to superconductivity due to a high $N(E_F)$. These results are contrasted to data for Ag-Pd-Ag and Ag-Cr-Ag EMFS. (30 refs.)

62731 On the magnetic dipole fields at surface atoms. P.H.Christensen, S.Morup (Lab. of Appl. Phys. II, Tech. Univ. of Denmark, Lyngby, Denmark). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.130-2 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The magnetic dipole fields at atoms in small particles and thin films of α -Fe have been calculated. Only the dipole fields in the first surface layer are significantly affected by the presence of the surface. It is shown that the shape anisotropy energy of microcrystals is influenced by these surface effects. (3 refs.)

62732 A universal dispersion equation of magnetostatic surface wave (MSSW) in the layer structures. Hu Wenzhong, Liu Farang (Southwest Inst. of Appl. Magnetics, Sichuan, China). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.153-4 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). A dispersion equation of MSSW propagation in the layer structures was derived. Two significant results were discovered in the numerical calculation from the equation: (1) a dispersion variable delay line could be made; (2) the linear dispersion regions and the differential delay time increase with the increasing number of the layers. (6 refs.)

62733 Magnetic and optical properties of Co, Bi substituted garnet films prepared by the LPE method and its application to thermomagnetic recording. F.Inoue, H.Mutoh, A.Itoh, K.Kawanishi (Dept. of Electronic Engng., Coll. of Sci. & Technol., Nihon Univ., Funabashi, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.170-2 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Co, Bi doped garnet films have a large Faraday rotation angle θ_F in the visible region, and the uniaxial anisotropy K_u and absorption coefficient α increases with Co substitution. Thermomagnetic recording threshold power is 4 mW for $\lambda=514.5$ nm and irradiation time $t=10$ μs , and 7.4 mW by coating of the Cr layer for $\lambda=632.8$ nm and $t=2$ μs . (7 refs.)

62734 Amorphous TbFe ultra thin film with reflective Au layer. F.Tanaka, N.Imamura (KDD Res. & Dev. Labs., Tokyo, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.173-4 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The thermomagnetic writing and reading of TbFe thin films with reflective layers were studied. As a result, the authors found the suitable thicknesses of SiO_2 -buffer and TbFe layers for low writing laser power and large effective Kerr rotation angle. (8 refs.)

62735 Garnet film with rectangular hysteresis loop and its application to thermomagnetic recording medium. Y.Yokoyama, S.Tsukahara, T.Tanaka (Electrotech. Lab., Ibaraki-ken, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.175-7 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Direct stacking of amorphous Dy-Fe and magnetic garnet layers resulted in a good medium for a thermomagnetic recording system. The composite film showed ten times larger optical rotation than the Dy-Fe film at $\lambda=550$ nm. The minimum diameter of the transcribed domain from Dy-Fe layer into the garnet layer was 4 μm . (6 refs.)

62736 Preparation and properties of RE-TM amorphous films. Y.Sakurai, K.Onishi (Faculty of Engng. Sci., Osaka Univ., Osaka, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.183-91 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

Amorphous magnetic thin films with perpendicular magnetization (GdFe, GdCo, TbFe etc.) are successfully prepared by a sputtering or evaporation technique. The magnetic compensation temperature of these films, which is estimated from $M-H$ curves by Kerr or Hall effect and is a meaningful parameter to study the film properties and devices application, is investigated as a function of preparation condition, temperature and thermal treatment after deposition. Other studies are involved with electrical properties, magnetic wall microscopic observation and its dynamics. Magneto-optic applications utilizing temperature dependence of coercivity are proposed such as thermomagnetic writing in high density thin film memory. (10 refs.)

62737 Magnetic properties and magnetic Kerr rotation of amorphous TbFeCo and TbFeCr films. H.Tsujimoto, M.Shouji, A.Saito, S.Matsushita, Y.Sakurai (Faculty of Engng. Sci., Osaka Univ., Osaka, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.199-201 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The Kerr rotation angle θ_K of $\text{Tb}_{21}(\text{Fe}_{100-x}\text{Co}_x)_{79}$ increases from 0.18° to 0.36° with increasing Co content x from 0 to 15. On the other hand, θ_K of $\text{Tb}_{21}(\text{Fe}_{79})_{100-x}\text{Cr}_x$ reduced with increasing x . The Curie temperature of $\text{Tb}_{21}(\text{Fe}_{100-x}\text{Co}_x)_{79}$ and $\text{Tb}_{21}(\text{Fe}_{79})_{100-x}\text{Cr}_x$ rose with increasing Co and Cr concentration. (9 refs.)

62738 The thermo-magnetic writing and erasing properties and Kerr rotation angle of amorphous RE-Fe thin films. S.Tanaka, N.Imamura (KDD Res. & Dev. Labs., Tokyo, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.205-7 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The thermo-magnetic writing and erasing properties and magneto-optical read-out properties of amorphous rare earth-iron (RE-Fe) thin films are studied. As a result, it is found that both properties depend on RE composition and that RE-rich film is rather suitable for magneto-optical recording media. (4 refs.)

62739 Magnetic properties, structure, and relaxation of amorphous $\text{Fe}_{1-x}\text{B}_x$ films. H.Hoffmann, M.Takahashi, J.Zweck (Inst. für Angewandte Phys., Univ. Regensburg, Regensburg, Germany). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.211-13 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Systematic investigations of the dependence of the magnetic and structural properties on the composition of as-sputtered and annealed $\text{Fe}_{1-x}\text{B}_x$ amorphous films were carried out. Most of the films were subject to strong relaxation during annealing. In the final state after annealing strong differences of magnetic properties, which originally existed due to the conditions of the preparation, vanished. (2 refs.)

62740 Magnetic and electrical properties of amorphous $\text{Fe}_{1-x}\text{B}_x$ films. T.Stobiecki (Solid State Phys. Dept., Acad. of Mining & Metall., Krakow, Poland), F.Stobiecki.

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.217-18 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

Thin $\text{Fe}_{1-x}\text{B}_x$ ($0 \leq x \leq 0.70$) films were prepared by means of RF sputtering. The authors found that magnetic moments (μ_F) for ribbons are higher than for films and the change of μ_F with x is larger for films than for ribbons. The percolation threshold ($x_c \approx 0.65$) of magnetic order occurs for a lower concentration of B than the value linearly extrapolated from the side of iron-rich concentration. The temperature coefficient of resistivity shows that boron contributes more electrons to the conduction process in amorphous films than in ribbons. (14 refs.)

62741 Magnetic properties of metastable crystalline and amorphous Fe alloys produced by RF sputtering. K.Sumiya, Y.Nakamura (Dept. of Metal Sci. & Technol., Kyoto Univ., Kyoto, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.219-20 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

X-ray diffraction, magnetization and Mossbauer effect were measured for Fe-Ti, Fe-Mn, Fe-Ni and Fe-Cu sputtered alloys. The single BCC phase region is extended to a large extent in all of these sputtered alloys. Amorphous Fe-Ti and FCC Fe-Cu alloys with high alloy concentrations are obtained in marked contrast to the equilibrium phase diagram. Both of these alloys are ferromagnetic at low temperatures. (10 refs.)

62742 Anomalous magnetization-temperature characteristics in amorphous NiP alloys. K.Iida (Fundamental School of Sci. & Technol., Keio Univ., Yokohama, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.226-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

Amorphous $\text{Ni}_{1-x}\text{P}_x$ alloy films ($0.15 < x < 0.27$) were prepared by the electroless deposition technique and the magnetization-temperature characteristics of those films were investigated. The results show anomalous characteristics of concave downwards in the temperature dependence of the magnetization. Such a unique phenomena occurred only in the Ni-metalloid alloys with a small saturation magnetization value. (8 refs.)

62743 Magnetic properties and microstructure in Ho-Co alloy thin films fabricated by RF sputtering technique. T.Suzuki (Dept. of Appl. Phys., Tohoku Univ., Sendai, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.232-4 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

Magnetic properties and microstructure of Ho-Co films are discussed. A columnar structure observed by transmission electron microscopy is suggested to be responsible for the perpendicular magnetic anisotropy. The compensation temperature increases with Ho concentration between 15 and 25 at.% for the amorphous phase. (9 refs.)

62744 Substrate bias voltage dependences of magnetic properties in amorphous Tb-Fe films. T.Katayama, M.Miyazaki, Y.Nishihara, T.Shibata (Electrotech. Lab., Ibaraki, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.235-7 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

Substrate bias voltage dependences of magnetic properties were measured in amorphous Tb-Fe films. The bias voltage dependence of K_u shows a minimum around $V_b = -60$ V. This is explained by effects of the preferential resputtering and oxidation of Tb atoms during deposition. (5 refs.)

- 62745 Magnetostriction and internal stress in GdFe amorphous films with perpendicular anisotropy prepared by RF diode sputtering.** A.Itoh, H.Uekusa, Y.Tarusawa, F.Inoue, K.Kawanishi (Dept. of Electronic Engng., Coll. of Sci. & Technol., Nihon Univ., Chiba, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.241-2 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The influence of the substrate bias voltage (V_b) on the saturation magnetostriiction (λ_s) and the internal stress (σ) were measured for RF sputter-deposited Gd-Fe films. The V_b dependence of the stress induced anisotropy K_2 ($= -3/2\lambda_s\sigma$) is similar to that of K_u in the lower V_b region. (5 refs.)
- 62746 Domain observation of amorphous Fe-B and Co-Fe-B films.** M.Jimbo, Y.Machata, S.Tsunashima, S.Uchiyama (Faculty of Engng., Nagoya Univ., Nagoya, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.263-5 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The domain structure is observed in amorphous Fe-B and Co-Fe-B films annealed in a static (DFA) or a rotating (RFA) magnetic field. Ripple-like subdomains are observed by Bitter technique in RFA films, which are from a large angular dispersion of the anisotropy axes. The magnitude dispersion of the anisotropy fields is also suggested to be large in RFA films. (5 refs.)
- 62747 Electron microscopy of CoCr sputtered films.** M.Ohkoshi, H.Toba, S.Honda, T.Kusuda (Dept. of Electronics, Hiroshima Univ., Higashi-Hiroshima, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.266-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The magnetization curling in the CoCr film is found by a high resolution Lorentz microscopy technique. Several grains assemble to form a column, and it is observed to behave as a magnetic cluster. The magnetization-reversal process is performed by the rotational switching in the magnetostatically coupled individual cluster. (6 refs.)
- 62748 Anomalous hysteresis loops in single and double layer sputtered TbFe films.** Tu Chen, R.Malmhall (Xerox Palo Alto Res. Centers, Palo Alto, CA, USA). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.269-71 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Hall and Kerr effect observations indicate that the anomalous loop of the single layer film is associated with the propagation of a compensation wall through the thickness which can occur only in conjunction with a gradual composition variation, whereas the loop in the double layer film is a simple addition of the loops of each layer. (6 refs.)
- 62749 Pair ordering and perpendicular anisotropy in RE-TM amorphous thin films.** L.J.Makymowicz, L.Dargel, M.Lubecka, M.Pyka (Dept. of Solid State Phys., Acad. of Mining & Metall., Cracow, Poland). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.281-5 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Atomic pair ordering may play an important role in determining the uniaxial anisotropy in thin amorphous rare earth-transition metal alloys. The authors present results for annealed Gd-Co RF sputtered films. After annealing at a temperature of at least 100°C alignment of the easy axis perpendicular to the film plane and an increase of Gd-Gd pairs occur. (5 refs.)
- 62750 Perpendicular magnetic anisotropy and ferromagnetic resonance in amorphous Gd-Co and Gd-Fe films.** Jin Han-Min (Dept. of Phys., Jilin Univ., Changchun, China). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.283-5 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). On the basis of a columnar microstructure model, formulae for perpendicular magnetic anisotropy (PA) and ferromagnetic resonance are deduced. The mechanism seems to be predominant in amorphous Gd-Co-Mo-Ar alloy films. The multi-peak FMR spectra observed in amorphous Gd-Co and Gd-Fe films can also be explained on this model. (12 refs.)
- 62751 Perpendicular anisotropy in Co-Cr films.** M.Ishizuka, T.Komoda, S.Tsushima, M.Yoshikawa, S.Ishio, M.Takahashi (Central Res. Labs., Engng. Center, Sharp Corp., Nara, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.286-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The temperature dependence of saturation magnetization and perpendicular magnetic anisotropy for 16 and 18% Cr-Co sputtered films was studied. The following were found: (i) the Curie temperatures of films are higher than those of bulk alloys; (ii) the perpendicular anisotropy constant increases after being heated to 400°C; and (iii) it changes from positive to negative at about 640°C. (6 refs.)
- 62752 Oblique incidence effects in evaporated thin films.** K.Ozawa (R&D Div., Magnetic Products Group, Sony Corp., Myagi-ken, Japan), T.Yanada, H.Masuya, M.Sato, S.Ishio, M.Takahashi. *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.289-92 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Magnetic properties, electrical resistance and microstructures of evaporated iron thin films deposited at an oblique angle of incidence have been investigated. The structure differs along the thickness direction and contains interstices. It is observed by the dark field image that the columns formed appear to be single-crystals at high incidence angles. (4 refs.)
- 62753 Structure and magnetic properties of iron films deposited at oblique incidence.** Y.Takeno, Y.Iwama (Dept. of Crystalline Materials Sci., Nagoya Univ., Nagoya, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.293-5 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The structure and the magnetic properties of iron films deposited at oblique incidence are investigated by means of Rutherford back scattering technique, electron microscopy and magnetic measurement. It is found that there is a fair amount of Fe_3O_4 in the film and it affects the magnetic properties of the film. (4 refs.)
- 62754 Magnetization reversal modes in thin films with columnar microstructure.** H.Danan (Lab. Pierre Weiss, Univ. Louis Pasteur, Strasbourg, France), W.Andra. *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.299-302 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Coherent rotation as well as curling may occur as a magnetization reversal mode in columnar films. The reversal is generally influenced by the surface anisotropy and the coercivity H_c depends on the columnar diameter a . Typical curves of $H_c(a)$ are calculated for Co and $\text{Co}_{85}\text{Cr}_{15}$. (11 refs.)
- 62755 Investigations of implantation-induced changes in surface layers of epitaxial garnet thin films.** M.H.Kryder, X.Wang, C.S.Krafft, A.M.Guzman (Carnegie-Mellon Univ., Pittsburgh, PA, USA). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.307-10 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Using newly improved FMR characterization techniques, the authors have established that mechanisms other than the implantation-induced stress are responsible for uniaxial anisotropy field change. They have measured λ_{111}/M_s and the crystalline anisotropy field H_1 in the implanted layer. H_1 is shown to decrease after implantation. (13 refs.)
- 62756 Large magnetic anisotropy change induced by hydrogen ion implantation in europium iron garnet LPE films.** H.Makino, Y.Hidaka, H.Matsutera (Microelectronics Res. Labs., Nippon Electric Co. Ltd., Kawasaki, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.311-14 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). H_2^+ ion implantation in $(111) \text{Eu}_2\text{Fe}_{10}\text{O}_{12}$ LPE films is found to induce an unusually large anisotropy field change of an order of 3000 Oe. By annealing at 300°C, the H_2^+ implantation induced anisotropy field decreases drastically, but lattice strain still remains at a high level. It is concluded that the contribution of hydrogen ions, which exist within the garnet film, should be intrinsic for the observed large anisotropy field change. (10 refs.)
- 62757 Effects of high dose ion implantation on structure and magnetic properties of 3d-metal films.** Y.Suezawa, Y.Gondo, T.Nakao, K.Kakuno (Faculty of Engng., Yokohama Nat. Univ., Yokohama, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.323-5 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The decrease of the magnetic moment was measured of Dy^{+} ion implanted Ni films. With some He^{+} backscattering observations, the observed decrease indicated that a paramagnetic Dy-Ni alloy layer was formed with the high dose implantation. (5 refs.)
- 62758 Magnetocrystalline anisotropy energy K_1 of Co^{2+} and Ru^{3+} substituted bubble garnet films.** J.Mada, K.Yamaguchi, H.Uchishiba (Fujitsu Labs. Ltd., Kawasaki, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.326-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The effect of Co and Ru substitution on magnetocrystalline anisotropy constant K_1 is studied using ferromagnetic resonance (at 9.4 GHz) for epitaxial YSmLuCaGe films grown on $[100]$ oriented $\text{Gd}_3\text{Ga}_2\text{O}_{12}$ substrates. K_1 increases in low Co substitution regions, but decreases in regions with higher substitution. For Ru, K_1 decreases monotonously with increasing substitution. (4 refs.)
- 62759 Interference enhanced Kerr spectroscopy for very thin absorbing films—application to amorphous terbium ion.** G.A.N.Connell, R.Allen, M.Mansuripur (Xerox Palo Alto Res. Center, Palo Alto, CA, USA). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.337-9 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). A new method of obtaining polar Kerr spectra from very thin absorbing films is used to study the thickness dependence of the Curie temperature, compensation temperature and critical behavior of the Fe-subnetwork of amorphous Tb-Fe alloy films. Significant deviations from bulk behaviour begin to occur at thicknesses below about 20 nm. (5 refs.)
- 62760 Localized modification of magnetic anisotropy in LPE iron garnet films by laser annealing.** K.Ando, Y.Yokoyama, T.Okuda, N.Koshizuka (Electrotech. Lab., Ibaraki, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.350-2 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). A method of obtaining localized modification of magnetic anisotropy in LPE garnet film is described. Localized annealing was done by heating the film with a CW argon laser beam in a high temperature furnace. The direction change of magnetization was observed at the irradiated area. (7 refs.)
- 62761 A new method for analysis of magnetic anisotropy in films using the spontaneous Hall effect.** K.Okamoto (Dept. of Technol., Kagawa Univ., Kagawa, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.353-5 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). A new method to determine the easy axis of films with uniaxial magnetic anisotropy using the spontaneous Hall effect is presented. The principle of the method is explained and its validity is verified by the experiments. (2 refs.)
- 62762 Analysis of type-II magnetic contrast from ferromagnetic thin films in the scanning electron microscopy.** T.Ikuta (Dept. of Appl. Electronics Osaka Electro-Communication Univ., Osaka, Japan), R.Shimizu. *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.356-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Type-II magnetic contrast in the scanning electron microscopy is a new observation technique for the magnetic domain in the ferromagnetic materials. The analysis of type-II magnetic contrast for magnetic thin films is achieved by using Monte Carlo simulation. The results show that transmitted (forward-scattered) electron image contains the magnetic contrast as well as the conventional backscattered electron image. (9 refs.)
- 62763 The correlation length in thin film and semi-infinite medium.** W.Korneta (Dept. of Phys., Tech. Univ., Radom, Poland), Z.Pytel. *Phys. Lett. A (Netherlands)*, vol.94A, no.6-7, p.305-8 (21 March 1983). Correlation lengths in directions parallel and perpendicular to a surface of a thin ferromagnetic film and a semi-infinite ferromagnet are calculated. Their dependences both on temperature and distance to a surface are discussed. (6 refs.)
- 62764 Magnetization of electron-bombarded iron-cobalt films.** L.A.Chebotaevich, V.G.Lifshits, V.A.Nachinov, Yu.D.Vorob'ev, V.V.Veter, U.A.Ulmanis (Far-East State Univ., Vladivostok, USSR). *Sov. Phys-Solid State (USA)*, vol.24, no.9, p.1494-6 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2636-40 (Sept. 1982). [received: April 1983] Chromium-doped iron-cobalt films are bombarded by electrons with energies of 75 keV and 3.8 MeV. The dose and concentration dependence of the relative magnetization are investigated. Estimates are made for the contributions to the change in the magnetization and coercive field due to the following radiation effects: the change in the chemical composition, amorphization,

the change in the thickness, and the formation of radiation defects. It is shown that the addition of chromium to $\text{Fe}_{0.6}\text{Co}_{0.4}$ films leads to a stronger decrease in the magnetization. (12 refs.)

62765 Structure and magnetic properties of C-axis well oriented Ba-ferrite films deposited by targets-facing type of sputtering. Y.Hoshi, M.Matsuoka, M.Naoe, S.Yamanaka (Faculty of Engng., Tokyo Inst. of Technol., Tokyo, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.166C, no.1, p.9-16 (Jan. 1983). In Japanese.

Ba-ferrite (BaM) films have been prepared by means of targets-facing type of sputtering method and their structure and magnetic properties have been investigated in detail. The film properties strongly depend on the sputtering conditions such as argon pressure P_{Ar} , substrate temperature T_s , crystal structure of the substrate and plasma confinement field. C-axis well oriented BaM films with good surface smoothness are obtained under certain preparation conditions a substrate which has amorphous crystal structure. The films show perpendicular magnetization and have almost the same magnetic anisotropy and saturation magnetization as those of single crystal BaM. (11 refs.)

62766 Formation of nonthrough magnetic domains in the course of magnetization switching in amorphous Gd-Co films. G.S.Kandaurova, M.F.Karimov (A.M. Gorki Ural State Univ., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.248-52 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A comparison was made of the magneto-optic magnetization curves, hysteresis loops, and domain structure on both surfaces of inhomogeneous Gd-Co films. It was found that transitions from a through to a nonthrough domain structure were possible in a magnetic field and that a system of nonthrough bubble domains could form. (9 refs.) A.T.

62767 Charged wall of a bubble domain. G.E.Khodenkov (Inst. of Electronic Control Machines, Moscow, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.400-2 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

An analytic explanation is given of the charging of domain walls in films with a bending-induced transverse anisotropy across the film thickness. (3 refs.) A.T.

62768 Motion of tops of domains in thin films with low-coercivity channels. A.V.Gavriluk, V.P.Karabanova, V.N.Popov, V.P.Panaetov, B.V.Gavriluk (Pedagogical Inst., Irkutsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.413-6 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

An electron microscope was used to study the motion of domains in thin films of the 83% Ni-17% Fe composition. It was found that the structure of the tops of domains determined the field needed to set these domains in motion in low-coercivity channels. (7 refs.) A.T.

62769 Observation of magnetic domain structure in thin ferromagnetic films by electron holography. A.Tonomura (Central Res. Lab., Hitachi Ltd., Tokyo, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.2, p.963-9 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

An overview is provided of a new method that has been developed for observing fine details of magnetic domain structures in thin specimens. In this method, in-plane magnetic lines of force inside a specimen are directly observed in the electron interference micrograph. Quantitative measurement is also possible, since two neighboring contour lines contain a constant magnetic flux of h/e . This method is also applicable to observation of microscopic distributions of magnetic fields. Several practical applications are presented using this technique. (17 refs.)

62770 Static and dynamic properties of thermomagnetic writing in amorphous TbFe films. S.Honda, J.Hirokane, M.Ohkoshi, T.Kusuda (Dept. of Electronics, Hiroshima Univ., Hiroshima, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.208-10 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The domain structure in the bit written thermomagnetically is investigated in detail, and also the dynamic process of the flux reversal in the writing is studied experimentally and theoretically. The formation of the domain structure in a written bit is explained consistently. (8 refs.)

62771 Domain structure in single crystal ferromagnetic oxide films near the phase transitions. R.Szymczak (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.243-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The observations of domain structure in single crystal ferromagnetic oxide films near phase transitions induced by temperature and by magnetic field have been carried out. The domain structure has been observed by means of the Faraday effect and by light diffraction. The following phase transition points have been studied in details: paramagnet-ferromagnet transition. Morin transition, compensation point and continuous spin reorientation points. It has been shown that in all considered cases dipolar interactions have significant influence on phase transitions and, in particular, on the magnetization distribution near the phase transition points. (28 refs.)

62772 Domain wall phenomena in bubble propagation layers. A.Hubert (Inst. fur Werkstoffwissenschaften, Univ. Erlangen, Erlangen, Germany).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.249-53 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The role of domain walls in bubble propagation layers is reviewed. Conventional permalloy overlay structures of typically 0.4-0.5 μm thickness show stray field free domain wall structures. These walls are very wide and mobile. It is concluded that wall pinning and irreversibilities are primarily connected with Bloch lines and other 'singularities' which cannot be stray field free. In ion-implanted bubble memories domain walls play a more important role. Generally one expects symmetric Neel walls. By a partial stress relaxation 'charged' walls are produced which are used for bubble transportation. The behaviour of these charged walls in connection with the details of the magnetoelastic interaction is investigated. (32 refs.)

62773 Influence of cation distribution induced by thermal annealing on magnetic bubbles properties in Ga-substituted garnet films. J.Gouzerh, H.Le Gall, J.M.Desvignes, R.Khalafouni, I.Puchalska (Lab. de Magnetisme et d'Optique des Solides, CNRS, Meudon Bellevue, France).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.272-4 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

After being annealed at different equilibrium temperatures $1125 \leq T_e \leq 1473\text{K}$, Ga-substituted YIG films were quenched and the change of the magnetic properties of the material ($4\pi M_s$, K_u) and the bubble parameters (field stability range, diameter, collapse field, characteristic length, wall energy) associated with the cation migration induced by the thermal treatment were determined. The results are discussed. (7 refs.)

62774 Standing waves of wall vibration. J.C.Slonczewski (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.275-7 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The forced vibrations of an infinite chain of coupled masses with long-range interactions is analyzed. Calculations explain the standing wave patterns observed by Spreen and Argyle (1982) in an array of plane parallel 180° domain walls pinned by a pair of cracks in a garnet film. (4 refs.)

62775 Perpendicular magnetic anisotropy and microstructure of sputter-deposited Co-Cr film. N.Honda, H.Awano, T.Samoto, J.Hokkyo (Sony Corp. Res. Center, Yokohama, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.278-80 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The Ar pressure dependence of both the microstructure and the magnetic properties of sputter-deposited Co-Cr film is investigated. As the Ar pressure decreases, the structural binding between columns in the film becomes denser and stronger. The columnar structure has no relation to the crystal orientation. A domain structure change is suggested. (4 refs.)

62776 Influences of ion implantation on charged wall properties in magnetic bubble devices. Y.Hidaka, H.Matsutera (Microelectronics Res. Labs., Nippon Electric Co. Ltd., Kawasaki, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.315-18 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

Bubble propagation properties for H_2^+ implanted contiguous disk tracks are investigated. The in-plane anisotropy energy along the good tracks' direction in the region between the tracks is found to be important for bubble propagation, due to the lattice strain relaxation at the pattern edge. (5 refs.)

62777 Structure and magnetic domain walls of Dy ion implanted Fe films. S.Tsukahara, T.Kanayama, H.Tanoue (Electrotech. Lab., Ibaraki, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.319-22 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

400 keV Dy^+ ions implanted into iron films stay interstitial among expanded BCC lattices of iron up to about 8 at.%, while the domain structure is dominated by the cubic anisotropy. At a little higher concentration of dysprosium the Dy-Fe film is transformed into amorphous, which accompanies an isotropic domain configuration. (3 refs.)

75.70K Domain structure (magnetic bubbles)

62778 Dynamic conversion of a magnetic bubble in a rotating gradient experiment. J.A.Nyenhuys, B.J.Guo, F.J.Friedlaender (School of Electrical Engng., Purdue Univ., West Lafayette, IN, USA), H.Sato. *J. Magn. & Magn. Mater. (Netherlands)*, vol.36, no.1-2, p.187-94 (1 April 1983).

The rotating gradient experiment was used to dynamically convert an $S=1$, unichiral bubble into one with a more complex domain wall structure. At least five distinct wall states were generated and could be identified by determining the momentum and winding number from the velocity vs. radial drive relation. The data provides evidence for the dynamic generation of vertical Bloch lines, Bloch curves and Bloch points. The bubble returned to the $S=1$, unichiral state when motion ceased. (15 refs.)

62779 High-speed photographic study of the dynamic properties of ferrite-garnet films with domain diameters less than 0.5 μm . L.P.Ivanov, A.S.Logginov, G.A.Nepokoichitskii, Yu.V.Starostin (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys. Tech. Phys. (USA), vol.27, no.10, p.1303-4 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2118-20 (Oct. 1982). [received: April 1983]

Reports the first experimental results obtained by high-speed photography using single light flashes concerning the dynamics of bubble domains of diameter $d \approx 0.4 \mu\text{m}$. By using a wide-aperture system the authors were able to achieve a spatial resolution $\sim 0.3 \mu\text{m}$ when the wavelength of the illuminating flash was $\sim 0.58 \mu\text{m}$. The time resolution of the equipment was $\sim 8 \text{ ns}$. Ferrite-garnet films of composition $(\text{Pb, Bi, Sm, Lu, Gd})_3(\text{Al, Si, Fe})_2\text{O}_{12}$ grown on the (111) plane on $\text{Ga}_2\text{Ga}_2\text{O}_3$ substrates. (14 refs.)

62780 Domain-wall velocity in iron garnet films in strong pulsed fields. A.F.Martynov, V.V.Randoshkin, R.V.Telesnin (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.7, p.348-9 (July 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.803-6 (July 1982). [received: April 1983]

Iron garnet films are promising materials for applications in a variety of magnetooptic information-processing devices. The speed of these devices increases with increasing velocity (v) of the domain walls. In the present experiments the authors used high-speed photography to study the motion of domain walls in iron garnet films in pulsed fields up to 1 kOe. The film was initially magnetized to saturation by a bias field H_b applied perpendicular to the plane of the film. A pulsed field H_p was applied antiparallel to the bias field. As a result, reverse-magnetization domains were nucleated in the film and grew. The velocity v was determined from the slope of the linear part of the time dependence of the displacement of the wall of a reverse-magnetization domain, corresponding to steady-state motion, at a large distance from the domain wall to the nucleation center. (6 refs.)

62781 Comparison of the magnetic properties of one- and two-layer iron garnet films. A.M.Yuzin, V.V.Randoshkin, R.V.Telesnin, A.V.Antonov, M.Yu.Gusev, Yu.V.Starostin (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.365-6 (July 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.844-8 (July 1982). [received: April 1983]

The authors report a study of the special magnetic properties of two layer iron garnet films due to the interaction between layers. As layer 1 they used films of the composition $(\text{Pb, Bi, Sm, Tm})_3(\text{Fe, Ga})_2\text{O}_{12}$, while layer 2 consisted of films of the composition $(\text{Gd, Y, Tm})_3(\text{Fe, Ga})_2\text{O}_{12}$. The film thickness h was measured by an interference method; the width W of the stripe domains and the bubble collapse field H_0 were measured by diffraction or magnetooptic methods; and the effective uniaxial anisotropy field $H_K = 4\pi M$, the width of the ferromagnetic resonance line ΔH , and the g -factor were measured by a ferromagnetic-resonance method at 9.34 GHz. The exchange-interaction constant A was determined from the Neel temperature T_N . (6 refs.)

75.80 MAGNETOMECHANICAL AND MAGNETOELECTRIC EFFECTS, MAGNETOSTRICTION

62782 Magnetoelastic damping and ΔE effect in amorphous alloys based on Fe-Ni. Yu.E.Kalinin, B.G.Sukhodolov, I.V.Zolotukhin, V.P.Alekhin (Polytech. Inst. Voronezh, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.243-7 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

An investigation was made of the magnetoelastic damping and of the ΔE effect (representing the relative reduction in the Young modulus) of amorphous $\text{Fe}_{40}\text{Ni}_{60}\text{P}_{14}\text{B}_{0.06}$ before and after magnetothermal treatment. The observed damping and ΔE effect were attributed to a magnetomechanical hysteresis. (12 refs.) A.T.

62783 An observation of magnetoelastic wave propagation in magnetic thin strips and films. K.Kakuno, D.Inami, K.Komatsu, Y.Suezawa, Y.Gondo (Dept. of Electrical Engng., Yokohama Nat. Univ., Yokohama, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.2, p.935-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

By the use of a microstrip line as a generator, the propagation characteristics of magnetoelastic waves are studied over a wide frequency range. The well defined attenuation constant is obtained as a function of frequency. It is found that the attenuation constant is almost directly proportional to the frequency. (1 ref.)

62784 Magnetostriction of Co-based amorphous alloys. K.Aso, S.Uedaira, M.Hayakawa, K.Hotai, Y.Ochiai, K.Hayashi, Y.Makino (Sony Corp. Res. Center, Yokohama, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1546-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The magnetostriction λ of Co-based amorphous alloys $\text{Fe}_x\text{Co}_{1-x}\text{Ni}_{1-x}\text{Si}_2\text{B}_8$, prepared by a rapid quenching technique, was obtained by measuring the tension dependence of the magnetic hysteresis loop at 8 Hz. A least squares fitting analysis leads to $\lambda(x,y,z,p,q) \times 10^6 = 0.714x - 0.0831y - 0.306z + 0.101p + 0.0955q$ in at.%. (14 refs.)

62785 Single-ion anisotropy and magnetostriction of amorphous alloys. Y.Suzuki, T.Egami (Dept. of Materials Sci. & Engng., Univ. of Pennsylvania, Philadelphia, PA, USA).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1549-50 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Local magnetic anisotropy and magnetostriction of amorphous alloys were studied using the point charge model. A simple formula was observed to describe linear magnetostriction. It was found that the unscreened point charge model always leads to zero magnetostriction, while ordinary screening makes the magnetostriction positive and anti-screening results in negative magnetostriction. (6 refs.)

62786 Magnetostriction and related properties in amorphous Fe-Nb-Si-B alloys. K.Inomata (Toshiba Res. & Dev. Center, Kawasaki, Japan), T.Kobayashi, M.Hasegawa, T.Sawa.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1577-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

A study was carried out to obtain Fe-based amorphous alloys with low magnetostriction. The magnetostriction (λ_s) was measured as functions of Nb and Fe content in Fe-Nb-Si-B amorphous alloys. It was found that the presence of Nb decreases λ_s , particularly in Fe-rich region. (8 refs.)

62787 Magnetostriction of iron, cobalt and nickel ternary amorphous ribbons. N.Tsuya, K.I.Arai (Res. Inst. of Electrical Communication, Tohoku Univ., Sendai, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1594-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The magnetostriction of iron, cobalt and nickel ternary amorphous alloy ribbons is studied theoretically. The role of many electronic excited states coupled by intra-exchange, as well as the spin self-orbit interaction to the ground state, seems to be essential in accounting for the magnetostriction in these alloys. (14 refs.)

62788 Saturation magnetostriction of some (FeCo)-metalloid-compounds and -amorphous alloys. M.Goto, H.Tange, T.Kamimori, K.Okuma (Faculty of Sci., Ehime Univ., Matsuyama, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1601-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

$[(\text{FeCo})_3\text{P}]$ and amorphous $(\text{FeCo})_{70}\text{Si}_{10}\text{B}_{13}$ alloy is measured. Addition of Co tends to make λ_s negative without any significant difference among these substances. The λ_s seems to be due to one ion character. (6 refs.)

62789 Magnetostriction of Co base amorphous alloys. H.Fujimori, N.S.Kazama, K.Hirose (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1603-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

It has been found experimentally that the negative magnetostriction of $\text{Co}_{95}\text{Nb}_5$ amorphous alloy changes to positive values as Co is replaced by Fe, Mn and Ti, while its negative value is enhanced by Ni. The concentration trends of Fe and Mn can be explained in terms of pseudo-dipole interactions of the magnetic atom pairs involved. (8 refs.)

62790 Magnetoelastic effects in amorphous metals due to surface crystallisation and oxidation. U.Gonser, M.Ackermann, H.-G.Wagner (Univ. des Saarlandes, Saarbrücken, Germany).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1605-7 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

In Mossbauer spectra of amorphous ribbons, variations in the relative line intensities indicate reorientations in the domain structure which have sometimes been interpreted as a sign of a bulk structural change. The authors present evidence that surface oxidation and crystallization are responsible for the observed anisotropies. These effects could be verified by simultaneous observation of the bulk by means of γ -absorption Mossbauer spectroscopy and of the surface by means of (emission) conversion Mossbauer spectroscopy (CEMS). (4 refs.)

62791 Giant attenuation of surface acoustic waves by ferromagnetic films. M.Levy, H.Yoshida (Phys. Dept., Univ. of Wisconsin-Milwaukee, Milwaukee, WI, USA).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.139-45 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The attenuation of surface acoustic waves at 618 MHz propagating through a 200 Å nickel film may be changed by 40 dB/cm by changing an applied magnetic field by $\pm 90 \text{ Oe}$. This giant effect is strongly dependent on the thickness of the nickel film. It appears that magnetoelastic coupling yields the proper magnitude for the giant effect. The frequency, thickness and temperature dependence of the effect are presented. Results obtained with Ni rich Fe-Ni alloy films are also presented. (10 refs.)

62792 Evaluation of magnetostriction constant in amorphous ribbons utilizing the velocity change of a magnetoelastic wave. T.Miyama, T.Fuji, K.Kumozaki, M.Inoue, H.Takahashi (Dept. of Electrical Engng. & Electron., Toyohashi Univ. of Technol., Aichi, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.146-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The magnetoelastic coupling constant B , or the saturation magnetostrictive constant λ_s in highly magnetostrictive amorphous ribbons was evaluated indirectly from the change of the sound velocity under application of external field or uniaxial tensile strain by comparing with the theory based upon the one-dimensional elastic beam model. (5 refs.)

62793 Temperature and field dependence of magnetostriction in amorphous thin films. H.Szymczak, R.Zuberek (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.149-52 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

The theory of temperature and magnetic field dependence of magnetostriction in amorphous thin films has been developed for the following models: pair-ordering model, random anisotropy model and columnar structure model. Detailed calculations have been performed within the molecular field approximation and spin-wave approximation. (14 refs.)

62794 Study of magnetoelastic waves by optical observation on the surface of magnetic materials. K.Kakuno, D.Inami, Y.Suezawa, Y.Gondo (Dept. of Electrical Engng., Yokohama Nat. Univ., Yokohama, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.155-7 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The wide band optical observation system of ME waves is developed by the use of a Kerr apparatus as a ME wave detector and a wide band microstrip line as a ME wave exciter. By means of this observation system, the strongly attenuated traveling magnetic waves are observed. (2 refs.)

62795 Propagation properties of magnetoelastic waves in a magnetic slab. M.Inoue, T.Fujii, T.Miyama (Dept. of Electrical Engng. & Electronics, Toyohashi Univ. of Technol., Aichi, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.158-60 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The theory of a magnetoelastic wave propagating in a magnetic slab with a uniaxial in-plane anisotropy is developed in order to explore the possibility of RF-magnetoacoustic devices. This is regarded as an extension of the theory of the Lamb wave in an elastic slab. Analysis suggests that the magnetoelastic surface wave is advantageous for some applications. (5 refs.)

62796 On the magnetostrictive phenomena in metamagnetism. J.A.Tuszynski, H.Cofta (Dept. of Phys., Univ. of Calgary, Calgary, Canada). *Physica B & C (Netherlands)*, vol.115 B+C, no.2, p.161-71 (Jan. 1983). A semi-classical model of a metamagnet exhibiting nonlinear temperature expansion is presented and analyzed. A direct comparison with the Mn_2GaC compounds as an example displaying such a phenomenon is made. Earlier predictions about the mechanisms involved are generalized and refined. Two distinct cases of the feasible metamagnetic behaviour are found and investigated. Both cases are free of internal contradictions and paradoxes, in contrast to the previous models. The possibilities of applications of this model to other types of magnetic substances are outlined. (36 refs.)

62797 The influence of nuclear quadrupole interactions upon electron spin-echo modulation induced by weak hyperfine interactions. A.A.Shubin (Inst. of Catalysis, Novosibirsk, USSR), S.A.Dikanov.

J. Magn. Resonance (USA), vol.52, no.1, p.1-12 (March 1983). The influence of nuclear quadrupole interactions on the electron spin-echo modulation induced by weak hyperfine interaction was analyzed theoretically in terms of the perturbation theory as related to the nuclear Zeeman interaction. The possibility of applying the results obtained to investigation of modulations from different nuclei was assessed. The quadrupole interaction effects in the modulation damping in disordered systems were estimated quantitatively. (16 refs.)

62798 Two-dimensional soliton contribution to the ESR linewidth in layered antiferromagnets? F.Waldner (Phys.-Inst., Univ. of Zurich, Zurich, Switzerland).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1203-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

In layered two-dimensional (2d) antiferromagnets, Mikeska's theory is applied as an alternate interpretation of the broadening of ESR linewidths ΔH_e above T_N . Although ΔH_e is well described by Mikeska's $\exp(+T_e/T)$, the values $E=kT_e/2$ are unreasonably high for thermal excitation. However, they would agree with the energy of two reversed neighboring spins or with classical dynamic excitations (moving 2d solitons). (10 refs.)

62799 Spin-lattice relaxation in excited triplet states of 4,4'-dichlorobenzophenone crystals in strong magnetic fields at 2K. A.A.Avdenko, S.N.Pakulov.

Opt. & Spectrosc. (USA), vol.53, no.2, p.217-18 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.367-9 (Aug. 1982). [received: April 1983]

The effect of induction and orientation of an external magnetic field on the electron spin-lattice relaxation (SLR) rate is studied in excited triplet states of X traps of a 4,4'-dichlorobenzophenone (DCB) crystal [the depth of the traps relative to the bottom of the triplet exciton band is 63 cm^{-1} , the zero-phonon emission band is located at $\lambda_{00}=413.54\text{ nm}$]. In the scope of the Debye model of the lattice the cubic dependence of the SLR rates on the magnitude of the magnetic field as well as the anisotropy of these rates in the field are in favor of a direct spin-lattice process occurring with the emission of resonant acoustic phonons. 62800 Spin relaxation and polarization under interaction of photocarriers with charged paramagnetic centers in a semiconductor. V.S.Vikhlin.

Opt. & Spectrosc. (USA), vol.53, no.1, p.110-11 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.185-6 (July 1982). [received: April 1983]

Discusses the processes of spin polarization (SP) and spin relaxation which are associated with hydrogenlike intermediate states of large radius formed under interaction of photocarriers with charged paramagnetic centers—a charged paramagnetic center+electron (hole)—with significant exchange interaction between the electron (hole) on an orbit of large radius and the paramagnetic core. It is shown that spin-dependent captures into like compound states, and their subsequent decay determine the SP and spin relaxation on charged paramagnetic impurities. The investigation was carried out by a method of kinetic equations. The decay of the Wannier-Mott exciton with the creation of a carrier of opposite sign and the capture of carriers by band-resonant exchange multiplets of the compound state is considered as the mechanism of spin-dependent capture in the compound state along with the cascade mechanism. (5 refs.)

76.30F Iron group (3d) ions and impurities (Ti-Cu)

62801 Detection of a new trigonal bipyramidal copper species in Cu-CaX zeolite by electron spin resonance and electron spin echo modulation analysis. M.Narayana, L.Kevan (Dept. of Chem., Univ. of Houston, Houston, TX, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3573-8 (15 March 1983).

Electron spin resonance and electron spin echo modulation analysis are used to identify the location and coordination of Cu^{2+} in hydrated and dehydrated CaX zeolite. A new, trigonal bipyramidally coordinated Cu^{2+} is found to be the dominant copper center in this zeolite. It is located in a six ring window (site S11) and coordinated to three six ring oxygens and two hydroxyls, one in the α cage and the other in the β cage of the zeolite. This $Cu(O_2)_3(OH)_2$ species is found to be stable for dehydration up to 180°C . At higher temperatures the Cu^{2+} species seems to be reduced irreversibly. However, a Cu^{+} species can be regenerated by oxidation and hydration but most of it is only trigonally coordinated. (37 refs.)

62802 Divalent manganese in an axial symmetry site of additively coloured CaO single crystals. H.S.Murrieta (Inst. de Fisica, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico), J.O.Rubio, M.G.Aguilar, J.Garcia-Sole.

J. Phys. C (GB), vol.16, no.10, p.1945-53 (10 April 1983).

Electron paramagnetic resonance data dealing with the first observation of a Mn^{2+} axial center in CaO are reported. The tetragonal EPR spectrum was found in additively coloured crystals at 100K the best-fit parameters to the spin-Hamiltonian were found to be: $g_{||}=2.0015$ (5), $g_{\perp}=2.0020$ (5), $b_2=+132.6$ (4) $\times 10^{-4}\text{ cm}^{-1}$, $b_4=+3.5$ (3) $\times 10^{-4}\text{ cm}^{-1}$, $b_6=+11.7$ (8) $\times 10^{-4}\text{ cm}^{-1}$, and $A=-67.2$ (5) $\times 10^{-4}\text{ cm}^{-1}$. The hyperfine coupling constant is anomalously small and points towards a considerable covalent bonding. The analysis of the data presented in this paper strongly suggests that the axial spectrum is due to Mn^{2+} ions perturbed by an adjacent F centre. Assuming this model, the reduction in the value of the hyperfine interaction relative to that of the free ion was estimated in terms of the approach of Simanek and Sroubek which puts the main emphasis of such a reduction on the covalent effects of the 4s orbitals of the Mn^{2+} ion and the result compares reasonably well with the experimental determination. (23 refs.)

62803 Electron spin resonance study of a disordered Ni-Mn alloy. H.Hurdequint, J.S.Kouvel, P.Monod (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1429-31 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

ESR spectra were obtained for disordered $Ni_{74}Mn_{26}$ cooled to $\approx 4\text{K}$ in zero field and 10 kOe. The resonance observed after field-cooling are asymmetric with the applied field direction up to $\approx 30\text{K}$ and continue to show a macroscopic anisotropic field up to $\approx 80\text{K}$, where a transition occurs from spin-glass to ferromagnetism. (6 refs.)

62804 Electron spin resonance in metallic spin-glasses above T_g . P.M.Levy, C.Morgan-Pond (Dept. of Phys., New York Univ., New York, NY, USA), R.Raghavan.

Phys. Rev. Lett. (USA), vol.50, no.15, p.1160-3 (11 April 1983).

Recent ESR measurements on the spin-glass Mn in the paramagnetic phase reveal an increase in the linewidth over the expected linear temperature dependence for $T/T_g \leq 3$. The Mori-Kawasaki formalism was used to calculate quantitatively the linewidth due to the broadening by the Dzyaloshinsky-Moriya anisotropy interaction of an exchange-narrowed line. With no adjustable parameters the authors explain the increase in linewidth, and they also relate the shift in the resonance to the imaginary part of the frequency-dependent self-energy. (11 refs.)

62805 Determination of the correlation between the crystal field axis system and the crystallographic axes in chromium-doped β -Ga $_2$ O $_3$ by EPR. W.Gunsser, K.Rohwer (Inst. für Phys. Chem., Univ. Hamburg, Hamburg, Germany).

Phys. Status Solidi b (Germany), vol.116, no.1, p.275-8 (1 March 1983).

The correct relationship is found between the crystal field axes and crystallographic axes in β -Ga $_2$ O $_3$ by application of a simplified orientation method. A computer program is set up, which is able to calculate and to plot the angular variation of the resonance field strengths and of the energy levels involved in EPR. In this way, the strange angular dependence of the EPR lines can be explained and the correctness of the stated correlation between the two axis systems can be verified. From the measured resonance fields a set of spin Hamiltonian parameters is calculated. (15 refs.)

62806 EPR experiments on the two-dimensional Heisenberg ferromagnet K_2CuF_6 . I.Yamada, I.Morishita, T.Tokuyama (Dept. of Phys., Chiba Univ., Yayoi-cho, Chiba, Japan).

Physica B & C (Netherlands), vol.115 B+C, no.2, p.179-89 (Jan. 1983).

EPR experiments have been made on the ideal two-dimensional Heisenberg ferromagnet K_2CuF_6 ($T_c=6.25\text{K}$) at 9.3 and 23.5 GHz over the temperature range of 4.2-300K. Below about 100K, where the ferromagnetic short range order grows, several features due to the high-temperature diffusion relaxation of the time correlation functions of spins are found to become more and more distinctive as the temperature decreases to T_c : (i) The linewidth ΔH increases rapidly keeping an $[a(3\cos^2\theta-1)^2+b]$ -like angular anisotropy (θ is the angle between the c axis and the external field); the anisotropy $\delta H(\theta=0^\circ)/\Delta H(\theta=90^\circ)$ increases and eventually it reaches the value 4, which is the ratio between the values of $(3\cos^2\theta-1)^2$ at $\theta=0^\circ$ and $\theta=90^\circ$. (ii) The

line shape at $\theta=0^\circ$ departs remarkably from Lorentzian. (iii) The first order satellite absorption line ($2\omega_0$ -line) increases its intensity. (iv) The second order satellite ($3\omega_0$ -line) becomes observable near T_c . These phenomena reflect the increasing importance of long-wavelength ferromagnetic fluctuations of spins with decreasing temperature. (34 refs.)

62807 Spin-lattice relaxation of Cr^{3+} in ZnS . V.Ya.Bratus', A.A.Bugai, M.F.Bulanyi, B.D.Shanina (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.9, p.1501-4 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2648-54 (Sept. 1982). [received: April 1983]

The spin-lattice relaxation of Cr^{3+} in single crystals of cubic ZnS containing packing defects is investigated at 9.3 GHz. The recovery of various ESR lines after inversion is studied in the range of direct relaxation processes. The ratio of the probabilities of spin-phonon transitions with selection rules $\Delta M_s = \pm 1$ and $\Delta M_s = \pm 2$ is determined; it agrees with the values of the static coefficients $G_{11} = -0.054 \text{ cm}^{-1}$ and $G_{44} = 0.21 \text{ cm}^{-1}$. This ratio is observed to be dependent on angle, due to anisotropy of the spin-phonon interaction. In the temperature range 1.55-300K the relaxation rate τ_1^{-1} may be described by the expression $\tau_1^{-1} \text{ sec}^{-1} = 2.17 + 1.8 \times 10^{-8} T^7 J_6 (\phi/T)$, where $\phi = 144\text{K}$ and corresponds to the first peak of the phonon density of the ZnS crystal, which is associated with transverse acoustic modes. It is shown that for $T > 7\text{K}$ the observed relaxation rates are due to an anharmonic Raman process. (18 refs.)

62808 Theoretical analysis of ESR measurements in $(\text{Gd}_x\text{Y}_{1-x})\text{Cu}$. E.Zipser (Inst. of Phys., Silesian Univ., Katowice, Poland). *J. Magn. & Magn. Mater. (Netherlands)*, vol.36, no.1-2, p.165-70 (1 April 1983).

A theoretical analysis of ESR measurements in $(\text{Gd}_x\text{Y}_{1-x})\text{Cu}$ [$x \in (0,1)$] which explains consistently the observed positive g shifts in unbottlenecked region and negative g shifts in bottlenecked region is performed. The concentration dependent density of states and the coherent scattering of the electrons by the impurities are taken into account. The theoretical calculations are in good agreement with experimental data. (17 refs.)

62809 Two-magnon scattering in iron-rich metallic glasses. B.Heinrich, K.Myrtle, J.M.Rudd, J.F.Cochran (Dept. of Phys., Simon Fraser Univ., Burnaby, BC, Canada), R.Hasegawa. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.3, p.1597-8 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The FMR absorption linewidth has been measured at 9, 24, 39 and 73 GHz in $\text{Fe}_{81}\text{B}_{13}\text{Si}_3\text{C}_2$ and $\text{Fe}_{80}\text{B}_{13}\text{Si}_3\text{C}_2$ for the temperature range 20 to 350°C. The results can be interpreted as a consequence of the combined contributions from Landau-Lifshitz intrinsic damping, two-magnon scattering and thermally activated surface recrystallization. (3 refs.)

62810 FMR line intensity and width in garnet ferrite films. A.M.Zyuzin, V.V.Randoshkin, R.V.Telesin (Lomonosov State Univ., Moscow, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1166-7 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1896-8 (Sept. 1982). [received: April 1983]

A method suitable for measurements in materials bearing submicron cylindrical magnetic domains (CMD) is that of ferromagnetic resonance (FMR). When this is used one is usually interested in the resonance relations and the width of the FMR line, which enables one to determine the value of $H_K 4\pi M_s$ (H_K is the uniaxial anisotropy field and $4\pi M_s$ is the saturation magnetization), the gyromagnetic ratio γ , and the damping parameter α . It is shown that additional information can be obtained by measuring the absorption-line intensity. (4 refs.)

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.402-3 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.927-9 (Aug. 1982). [received: April 1983]

Studies the effect of Si on the ferromagnetic resonance of a thin Co film. As the diffusing electrons play an important role in the appearance of ferromagnetic order, the diffusion into the semiconductor changes the macroscopic characteristics of the ferromagnet near the interface, and this influences the FMR line shape. 76.60 NUCLEAR MAGNETIC RESONANCE AND RELAXATION

62812 Investigation of the NMR enhancement factor in CuMn spin glasses. Ch.Schlosser, H.Bromer (Inst. für Metallphys. und Nukleare Festkörperphys., Tech. Univ. Braunschweig, Braunschweig, Germany). *Z. Phys. B (Germany)*, vol.50, no.3, p.247-54 (1983).

The NMR enhancement factor of a frozen CuMn spin glass has been measured at a temperature $T \approx T_g/5$. The measurements were performed as function of static magnetic fields of different directions. A two component model of a spin glass has been outlined. One component being a 'system of single spins' and the other one being a 'subsystem of clusters'. Both components were attributed to different kinds of interaction being RKKY and dipole interaction respectively. The effective anisotropy field of the single spin system consists of two unidirectional contributions H_A^z and H_A^x , which have been measured for different conditions. A second anisotropy field H_d binds the cluster system to the system of single spins. All anisotropy fields depend on the annealing temperature of the alloys. (16 refs.)

62813 Phosphorus NMR study of solid amorphous calcium phosphate. J.Tropp (Dept. of Chem., MIT, Cambridge, MA, USA), N.C.Blumenthal, J.S.Waugh.

J. Am. Chem. Soc. (USA), vol.105, no.1, p.22-6 (12 Jan. 1983). The authors have characterized solid synthetic amorphous calcium phosphate (ACP) by ^{31}P NMR, using magnetic angle spinning, proton enhancement via cross polarization, and variable temperature. With π cross polarization, the spinning sidebands of ACP are stronger than those of unprotonated phosphate in hydroxylapatite, but weaker than those of dibasic calcium phosphates. Cross polarization over a wide range of mixing times causes no change in the appearance of ACP spectra from 25 to -120°C . In contrast, mixtures of hydroxylapatite with dibasic calcium phosphates, which, without cross polarization mimic the appearance of ACP spectra, show large differential enhancements of sideband intensities when cross polarized. Octacalcium phosphate behaves similarly to the mixtures. Vacuum drying of ACP at 450°C removes tightly bound water. The sidebands of dried ACP are undiminished, but no cross polarization signal can be obtained. Similar drying of hydroxylapatite effects neither the sideband intensities nor the cross polarization. They conclude that the strength of ACP sidebands is due to a characteristic structural distortion of unprotonated phosphate and not to a mixture of protonated and unprotonated phosphates. Structural models of ACP and the implications for ^{31}P NMR studies of bone mineral are briefly discussed. (18 refs.)

62814 Multiple-quantum NMR in solids. Yu-Sze Yen, A.Pines (Dept. of Chem., Univ. of California, Berkeley, CA, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3579-82 (15 March 1983). Multiple-quantum NMR has typically been observed in small groups of spins in isolated molecules. Due to the profusion of spin transitions in a solid, individual lines are unresolved. Excitation of high quantum transitions by normal schemes is thus difficult. To ensure that overlapping lines add constructively and to enhance sensitivity, time-reversal pulse sequences are used to generate all lines in phase. Up to 22-quantum ^1H absorption in solid adamantane is observed. (14 refs.)

62815 Nuclear magnetic resonance of ^{89}Y in intermetallic compounds $\text{Y}(\text{Fe}_{1-x}\text{Mn}_x)_2$. H.Nagai, H.Yoshie, A.Tsujimura (Dept. of Phys., Shinshu Univ., Matsumoto, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1122-3 (April 1983). The NMR spectra of ^{89}Y have been observed at 4.2K to investigate the magnetic properties of $\text{Y}(\text{Fe}_{1-x}\text{Mn}_x)_2$. There are two kinds of Mn moments in low Mn-concentrations; one is antiparallel to the Fe moment and estimated to be $0.5 \mu_B$ per Mn (low spin state), and the other is parallel to the Fe moment and has $2.7 \mu_B$ per Mn (high spin state). (9 refs.)

62816 Enhanced NMR of ^{169}Tm in TmAsO_4 . B.Bleaney, J.F.Gregg, M.J.M.Leask, M.R.Wells (Clarendon Lab., Univ. of Oxford, Oxford, England).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1061-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

TmAsO_4 has doublet ground state which is split by a co-operative Jahn-Teller distortion below $T_D = 6.13\text{K}$. Optical absorption spectroscopy, magnetic susceptibility and enhanced NMR of $^{169}\text{Tm}(I=1/2)$ have been used to measure precisely the parameters g , B_0 and Δ_0 ; overall the results agree well with the predictions of mean field theory. (8 refs.)

62817 NMR in metallic glasses. J.Durand, P.Panissod (LMSES, Strasbourg, France).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1567-70 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

NMR measurements can yield some insight into the electronic structure of metallic glasses through the Korringa ratio in nonmagnetic alloys and through the mean value of the hyperfine field in amorphous ferromagnets. Some information on the local symmetry around a given nuclear site is provided by

analysis of the quadrupolar NMR spectra. Spin echo NMR spectra in amorphous ferromagnet exhibit structures whose origin is discussed for each family of alloy. These structures originate either from quadrupolar interactions, or from different magnetic states of the resonant species, or from well-defined regions of different local environments with different domain wall regions. (40 refs.)

62818 Local lattice expansion of Cu arising from dilute interstitial impurities, β -emitting nuclei ^{12}B and ^{12}N . T.Minamisano, Y.Nojiri, K.Matsuda (Faculty of Sci., Osaka Univ., Osaka, Japan). *Phys. Lett. A (Netherlands)*, vol.94A, no.6-7, p.312-16 (21 March 1983). Lattice expansions of Cu in the nearest octahedral surroundings of interstitial ^{12}N were determined to be $\Delta r/r = 0.11 \pm 0.02$ and 0.13 ± 0.06 respectively using NMR detection. The results are informative to the study of the hyperfine interactions of the impurities in ferromagnetic Ni. (10 refs.)

62819 NMR-induced recombination of spin-polarized hydrogen. B.Yurke, J.S.Denker, B.R.Johnson, N.Bigelow, L.P.Levy, D.M.Lee, J.H.Freed (Lab. of Atomic & Solid State Phys., Cornell Univ., Ithaca, NY, USA). *Phys. Rev. Lett. (USA)*, vol.50, no.15, p.1137-40 (11 April 1983). The presence of an inverted population of H \uparrow with very high electronic and nuclear spin polarization is confirmed with a new barometric-NMR method and by free-induction decay. With this new technique, the temperature dependence for the ratio of the two state-dependent recombination rate constants is measured. The rate of spin relaxation in the gas agrees with the latest theory, but relaxation on the surface is much faster than predicted, and there is an important surface one-body relaxation process. (12 refs.)

62820 Distribution of double bonds in thermally degraded polyisobutylene. [PMR observations]. T.Kuroki, T.Sawaguchi, K.Suzuki, S.Ide, T.Ikemura (Dept. of Industrial Chem., Coll. of Sci. & Technol., Nihon Univ., Tokyo, Japan).

Polymer (GB), vol.24, no.4, p.428-32 (April 1983). The distribution of double bonds in thermally degraded polyisobutylene was determined quantitatively by using pulsed Fourier transform ^1H NMR, spectroscopic analysis. The double bonds in the degraded polymer did not exist in the interior but at the terminal positions of the polymer chain. These olefins were of the terminal trisubstituted and terminal vinylidene types. The content of the former was much greater than that of the latter. This shows that radical chain transfer predominantly occurs at the methylene hydrogen rather than at the methyl groups of the polymer chain. The average number of double bonds per molecule, f , was greater than 1 and tended to be near 2. (15 refs.)

62821 NMR of mixed crystals $(\text{CH}_3\text{NH}_3)_x\text{Cu}(\text{Cl}_{1-x}\text{Br}_x)_4$ ($0 \leq x \leq 1$). II. Distribution of Cl and Br. Y.Suzuki, H.Kubo, K.Hirakawa. *Technol. Rep. Kyushu Univ. (Japan)*, vol.55, no.4, p.351-6 (Aug. 1982). In Japanese. [received: Feb. 1983] NMR measurements of Cu and Cl nuclei are carried out in the magnetically ordered state on the single crystals grown slowly in aqueous solutions. NMR lines are distinguished by n of the complex $(\text{CuCl}_{4-n}\text{Br}_n)$ ($n=0,1,2,3,4$). By comparing the relative intensities of the lines, the rates of the complexes $(\text{CuCl}_{4-n}\text{Br}_n)$ with different n can be determined. The rate of CuCl_2Br_2 is very large. It is also clarified that the ratio of NMR intensities of Cl nuclei on the c -axis to the c -plane becomes small with the increase of x . It is concluded that the Br ions preferentially occupy the positions on the c -axis. (4 refs.)

62822 NMR study of deuterium molybdenum bronze. C.Marinos, S.Plesko, J.Jonas (Materials Res. Lab., Univ. of Illinois, Urbana, IL, USA), D.Tinet, J.J.Fripiat. *Chem. Phys. Lett. (Netherlands)*, vol.96, no.3, p.357-60 (8 April 1983).

The deuterium NMR lineshape and spin-lattice relaxation time, T_1 , have been measured in deuterium molybdenum bronze, $\text{D}_{16}\text{MoO}_3$, over the temperature range 166-400K. The ^2D quadrupole coupling constant is 21 kHz at room temperature. The temperature dependence of the ^2D T_1 has been interpreted in terms of two independent motional processes for deuterium. The data suggest that one of the processes corresponds to diffusion of the ^2D nuclei whereas the other may arise from a 180° flipping of the OD_2 moieties. This specific interpretation agrees with the results obtained for proton T_1 and proton lineshape data reported earlier. (15 refs.)

62823 Spin-spin and spin-lattice contributions to the rotating frame relaxation of ^{13}C in L-alanine. K.Akasaka, S.Ganapathy, C.A.McDowell, A.Naito (Dept. of Chem., Univ. of British Columbia, Vancouver, British Columbia, Canada). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3567-72 (15 March 1983).

The spin-lattice relaxation times in both the Zeeman (T_1^Z) and rotating (T_1^R) frames were determined for three chemically distinct carbon atoms (^{13}C) in polycrystalline L-alanine by combining cross polarization and magic angle spinning techniques together with proton decoupling. The spin-lattice and spin-spin contributions to the experimentally measured T_1^R could be separated by an experiment in which the ^{13}C spin-locking field was varied. The spin-lattice contributions (T_1^R), which contain motional information, were determined to be 21.7, 23.4, and 138 ms for the C_α , CH_3 , and COO^-

carbons, respectively. The spin-spin contribution (T_{CH}^D) was found to be exponential, namely, $(T_{CH}^D)^{-1} \propto \exp(-2\pi\nu_{CH}^D)$ in the low ^{13}C spin-locking field. Therefore, the assumption of a Lorentzian correlation function for the proton dipolar fluctuations is adequate for L-alanine. Furthermore, the proton dipolar correlation times τ_D were found to be the same (31 ± 1 μs) for all three carbons in L-alanine. The spin-lattice relaxation times in the Zeeman frame T_1^Z were determined to be 4.0 s, 38 ms, and 13 s for the C_α , CH_3 , and COO^- carbons, respectively. The experimental values of T_1^R and T_1^Z can be explained quantitatively by considering the internal rotations of the methyl and amino groups. (25 refs.)

62824 Nuclear magnetic relaxation study of fully deuterated sulfolan. H.Peemoller, A.R.Sharp (Dept. of Phys., Univ. of New Brunswick, Fredericton, New Brunswick, Canada), A.Watson, D.W.Kydon. *J. Chem. Phys. (USA)*, vol.78, no.7, p.4337-9 (1 April 1983).

Molecular motions of the fully deuterated sulfolan molecule ($\text{C}_4\text{D}_8\text{O}_2\text{S}$) have been studied in the solid state by NMR measurements of the deuteron spin-lattice relaxation times in the laboratory (T_1) and rotating ($T_{1\rho}$) frame. In the crystalline phase, it has been found that the relaxation is determined by the ring puckering motion of the molecule. The plastic crystal phase is found to exhibit effects from both isotropic reorientation and translational diffusion. The modified nature of this phase and the plastic-crystalline transition of the deuterated as compared to the undeuterated solid is discussed in terms of the C-H-O hydrogen bonding between molecules. (14 refs.)

62825 Pressure dependence of ^{19}F spin relaxation in $(\text{NH}_4)_2\text{SiF}_6$. M.Mackowiak, R.J.C.Brown (Dept. of Chem., Queen's Univ., Kingston, Ontario, Canada).

J. Magn. Resonance (USA), vol.52, no.1, p.71-5 (March 1983). The ^{19}F NMR spin-lattice relaxation time in the rotating frame, $T_{1\rho}$, was measured as a function of pressure and temperature for polycrystalline cubic $(\text{NH}_4)_2\text{SiF}_6$ for pressures up to 230 MPa. The $T_{1\rho}$ data were analyzed in terms of the molecular reorientation of the SiF_6^{2-} ions. The reorientational activation volume was $(12.4 \pm 0.2) \text{ cm}^3 \text{ mol}^{-1}$, which is 13.9% of the molar volume. (11 refs.)

62826 Evidence for magnetic soliton in CsNiF_3 : nuclear magnetic relaxation studies. T.Goto (Coll. of Liberal Arts, Kyoto Univ., Kyoto, Japan), Y.Yamaguchi.

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1211-12 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

The spin-lattice relaxation times of ^{133}Cs in CsNiF_3 were measured with moderate fields applied in the easy plane. The data at relatively low fields and high temperatures, which exhibited deviations from exact calculations for the three-magnon process, were in reasonable agreement with the predictions of the soliton model. (6 refs.)

62827 Strongly entangled polymer chains in a melt. Description of NMR properties associated with a submolecule model. J.P.Cohen-Addad, R.Dupeyre (Lab. de Spectrometrie Phys., Univ. Sci. et Medicale de Grenoble, Grenoble, France).

Polymer (GB), vol.24, no.4, p.400-8 (April 1983). A model is proposed to illustrate properties of the transverse magnetic relaxation function, $G(t)$, of proton pairs linked to strongly entangled polymer chains in a melt. According to this model, any polymer molecule is described as a freely jointed chain and it is divided into submolecules of equal contour length L_c . Every link is supposed to carry a proton pair; dipolar spin couplings between different proton pairs are neglected. The disentanglement relaxation time is supposed to be much longer than any characteristic time of the spin system; consequently, any submolecule observed on an NMR time scale is supposed to have fixed ends. It is considered that the residual spin-coupling energy resulting from such a constraint governs the magnetic relaxation process. The free induction decay is expressed as a contour length function. Theoretical results are compared with magnetic relaxation process. The free induction decay is expressed as a contour length function. Theoretical results are compared with magnetic relaxation properties observed on entangled real chains: polydimethylsiloxane and cis-1,4-polybutadiene. (34 refs.)

62828 Molecular rotation in ideal mixed systems: benzene-neopentane. I. Test of a hydrodynamic model of motion. K.-L.Oehme, G.Rudakoff (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Universität Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.1085-92 (1982). In German.

A nuclear relaxation study (^2D - T_1) of neopentane- d_{12} dissolved in benzene, tetramethylsilane, and tetramethyltin is presented. The data are given as a function of viscosity. They are interpreted with the framework of the hydrodynamic 'slip' model. The boundary conditions necessary for the solution of the Navier-Stokes equation are sensitivity to a change in the chemical surroundings. Both rotational and translational motion are described by the same hydrodynamic parameters. (21 refs.)

62829 ^{87}Rb and ^{85}Rb NQR study of phase transitions in $\text{RbH}_2(\text{SeO}_3)_2$. J.Seliger, V.Zagar, R.Bline (J. Stefan Inst., E. Kardelj Univ. of Ljubljana, Ljubljana, Yugoslavia), L.A.Shuvalov. *J. Phys. (France)*, vol.44, no.4, p.521-4 (April 1983).

The temperature dependence of the nuclear quadrupole resonance spectra of ^{87}Rb and ^{85}Rb in $\text{RbH}_2(\text{SeO}_3)_2$ has been measured by a proton-Rb double resonance technique in the laboratory frame. The increase in the number of chemically non-equivalent sites from one to four and the observed temperature dependence of the quadrupole coupling constants and the asymmetry parameters on going into the ferroelectric phase agrees with the proposed soft mode motion involving rotations of one type of SeO_3 groups. The existence of an intermediate incommensurate phase between T_c and $T_c + 4\text{K}$ has been confirmed. (22 refs.)

62830 Theory of coherent quasi-steady states in NQR multipulse experiments. V.L.Ermakov, D.Ya.Osokin (Physico-Tech. Inst., Acad. of Sci., Kazan, USSR). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.239-48 (1 March 1983).

On the basis of the average Hamiltonian theory the influence of the pulse sequence $\omega_{(1)}^0 - (\tau - \tau_{(2)}^0) \omega_{(2)}^0 - 2\tau - \tau_{(2)}^0 - \tau_{(1)}^0$ on a system of two dipolar coupled equivalent spin-1/2 nuclei each subject to local electric field gradients is studied. Using a fictitious spin-1/2 formalism a general method is developed for solving the Liouville equation for such spin systems, leading to results which reproduce the experimentally observed quasi-steady state of magnetization in nitrogen-14 pulse experiments. Expressions for the density matrix of

the system in terms of the effective time $\pi 4\tau$ and the parameters characterizing the quadrupolar and dipolar interactions are obtained. (9 refs.)

62831 Influence of defects on NQR relaxation processes in Bi_2GeO_5 and $\text{Bi}_{12}\text{SiO}_{20}$. A.Yu.Kudzin, S.M.Ryabchenko, A.D.Skorbin (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.9, p.1483-7 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2618-25 (Sept. 1982). [received: April 1983]

In order to explain the observed anomalies in the functions $T_1(T)$ and $T_2(T)$ in NQR in Bi_2GeO_5 and $\text{Bi}_{12}\text{SiO}_{20}$, a mechanism is proposed that averages the inhomogeneous contributions to the line broadening as a result of the motion of the defects causing this broadening. It is suggested that there are several mechanisms of inhomogeneous broadening, the principal one being static. Agreement between theory and experiment is achieved. (7 refs.)

62832 Chlorine-35 nuclear quadrupole resonance of o-chloronitrobenzenes. I.A.Kyuntsel', G.B.Soffer, M.O.Loizinski (Perm State Univ., Perm, USSR). *Theor. & Exp. Chem. (USA)*, vol.18, no.2, p.213-15 (March-April 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.2, p.246-9 (March-April 1982). [received: Feb. 1983]

The authors used ^{35}Cl NQR to determine the position of the NO_2 group with respect to the aromatic ring in crystals of ortho-chloronitrobenzenes. (14 refs.)

^{14}N and ^{35}Cl double resonance study of the phase transition in the intercalated bilayer compound $\text{C}_{10}\text{H}_{21}\text{NH}_3\text{Cl}$ See Entry 62836

76.60L Spin echoes

62833 Spin echo of ^{59}Co and ^{63}Cu impurity nuclei in single-crystal iron films in the case of coincidence of nuclear magnetic and ferromagnetic resonance frequencies. E.S.Mushailov, N.V.Baksheev (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.253-8 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

Characteristics of the formation of a spin echo in an electron-nuclear system containing ^{59}Co and ^{63}Cu impurity nuclei in a single-crystal iron matrix were investigated by the simultaneous excitation of NMR and FMR. It was found that the echo signal intensity was a function of the nature of the effective fields H_i at the nuclei. In the case of a strong ferromagnetic coupling between the impurity and the matrix, the electron spin system determined the amplification of the RF pulse and the enhancement of the response of the nuclear system under resonance excitation conditions. In the case of a weak coupling (Cu atoms in the iron matrix) the situation was typical of the mechanism of formation of an echo signal in paramagnets and diamagnets subjected to strong RF fields. (15 refs.) A.T.

76.70 MAGNETIC DOUBLE RESONANCES AND CROSS EFFECTS

76.70D Electron-nuclear double resonance (ENDOR)

62834 ENDOR study of bis(acetylacetonato)copper(II) in solid solution. B.Kirste, H.van Willigen (Dept. of Chem., Univ. of Massachusetts, Boston, MA, USA).

J. Phys. Chem. (USA), vol.87, no.5, p.781-8 (3 March 1983).

The bis(acetylacetonato)copper(II) ($\text{Cu}(\text{acac})_2$) complex and its adducts with methanol and pyridine in frozen solution have been studied by using ENDOR and electron-nuclear-nuclear triple resonance (TRIPLE). The ENDOR spectra yield the values of the principal components of the hyperfine tensors of the CH and CH_3 protons. Signs of the hyperfine components were determined with the aid of TRIPLE and computer simulations. Measurements of quadrupole splittings in ^2H ENDOR spectra of $\text{Cu}(\text{acac}-3-d)_2$ oriented in a frozen liquid crystal allowed the assignment of the in-plane CH couplings to specific molecular axes and also provided information on the alignment of the molecule in the nematic phase. (33 refs.)

76.70F Double nuclear magnetic resonance (DNMR)

62835 ^{13}C NMR investigations of the ferroelectric phase transition of tris-sarcosine calcium chloride. D.Michel, F.Engelke (Sektion Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany).

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.361-5 (8 April 1983).

^{13}C NMR spectra were measured for tris-sarcosine calcium chloride (TSSC) crystals in the paraelectric phase (at temperatures of ≈ 300 and 150K) and in the ferroelectric phase (at temperatures of 119K) by double-resonance techniques with proton decoupling. The ferroelastic single crystals were rotated around their three crystallographic axes to derive the tensors of magnetic shielding for the different carboxylic carbon atoms. There is no change of the eigenvalues and eigenvectors of the tensors at the phase transition. The results are consistent with the interpretation of former EPR data. (13 refs.)

62836 ^{14}N and ^{35}Cl double resonance study of the phase transition in the intercalated bilayer compound $\text{C}_{10}\text{H}_{21}\text{NH}_3\text{Cl}$. J.Seliger, V.Zagar, R.Blinc (J. Stefan Inst., E. Kardelj Univ. of Ljubljana, Ljubljana, Yugoslavia), H.Arend, G.Chapuis.

J. Chem. Phys. (USA), vol.78, no.5, p.2661-4 (1 March 1983).

The pure nuclear quadrupole (NQR) spectra of ^{14}N , ^{35}Cl , and ^{37}Cl have been measured in $\text{C}_{10}\text{H}_{21}\text{NH}_3\text{Cl}$ as a function of temperature. The chlorine NQR frequency $\nu_Q(\text{Cl}) = 1215\text{ kHz}$ at 47°C is determined by the N-H...Cl hydrogen bonds and is the lowest reported so far. The ^{14}N quadrupole coupling data $e^2qQ/h = 760\text{ kHz}$, $\eta = 0$ shows that the C-N-H-Cl backbone is practically rigid at this temperature. Above 53°C the effects of the phase transition from an intercalated to a nonintercalated structure show up in the N-H...Cl backbone as a sharp drop of the NQR frequencies to $\sim 60\%$ of their rigid lattice values. A model accounting for this effect has been proposed. (10 refs.)

ORAND—a new NMR double resonance technique for obtaining symmetrically intense multiplets by off-resonance experiments See Entry 59806

76.70H Optical double magnetic resonance (ODMR)

62837 Optically detected magnetic resonance in amorphous semiconductors. K.Morigaki (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.375-88 (March 1983).

The principle of optically detected magnetic resonance (ODMR) is briefly described, bearing in mind its application to amorphous semiconductors. The

ODMR measurements including those which are time-resolved are reviewed on amorphous semiconductors, particularly on hydrogenated amorphous silicon (a-Si:H). The nature of the recombination centres in a-Si:H is also discussed.

62838 Magnetic resonance on localized excited triplet states in 1,4-dibromonaphthalene [one-dimensional conductor]. Ch.H.L.Weytens, J.M.J.Vankan, V.S.Veeman (Dept. of Phys. Chem., Univ. of Nijmegen, Nijmegen, Netherlands).

Spectrosc. Lett. (USA), vol.15, no.12, p.953-62 (1982).

Kinetic parameters of localized excited triplet states in 1,4-dibromonaphthalene have been determined from ODMR and MDP experiments. The results show that no Boltzmann equilibrium exists over the triplet exciton sublevels at the moment of trapping. These experiments are in agreement with previously reported findings, that in 1,4-dibromonaphthalene excitons exist with a very short lifetime. (10 refs.)

76.80 MÖSSBAUER EFFECT; OTHER GAMMA-RAY SPECTROSCOPY

62839 Determination of hyperfine interaction parameters from poorly resolved Mossbauer spectra with the transmission integral. D.Gryffroy, R.E.Vandenberghe (Lab. of Magnetism, Gent State Univ., Gent, Belgium). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.207, no.3, p.455-8 (1 April 1983).

For badly resolved Mossbauer spectra of ^{61}Ni and ^{121}Sb it is demonstrated that even for moderate thickness the analysis with a sum of Lorentzians instead of the complete transmission integral may introduce significant deviations in determining hyperfine interaction constants. Graphs with the relative deviations for purely magnetic and quadrupolar interactions are shown. From these plots it is indicated when the use of the complete transmission integral is recommended. (9 refs.)

62840 Mossbauer spectroscopy in physical metallurgy. U.Gonser (Angewandte Phys., Univ. des Saarlandes, Saarbrücken, Germany).

Hyperfine Interactions (Netherlands), vol.13, no.1-3, p.5-23 (Jan. 1983).

In this anniversary contribution the natural and intimate 'match making' which occurs between the two star performers— ^{57}Fe in Mossbauer spectroscopy and iron in physical metallurgy—is described by selecting typical examples reflecting the author's interest: phases, f.c.c. $\gamma\text{-Fe}$, defects, diffusion and amorphous metals. (38 refs.)

62841 Mossbauer spectroscopy and magnetism. J.Chappert (Dept. de Recherche Fondamentale, CENG, Grenoble, France).

Hyperfine Interactions (Netherlands), vol.13, no.1-3, p.25-43 (Jan. 1983).

A review of the impact of the Mossbauer effect on the field of magnetism during the last twenty-five years is presented. After a brief description of the magnetic hyperfine interaction and its relationship to the basic ingredients of magnetism, one examines how various external parameters can affect the shape of the Mossbauer spectra. These data provide original information on the magnetic properties. (67 refs.)

62842 The impact of Mossbauer spectroscopy on chemistry. T.C.Gibb (Dept. of Inorganic & Structural Chem., Univ. of Leeds, Leeds, England).

Hyperfine Interactions (Netherlands), vol.13, no.1-3, p.45-56 (Jan. 1983).

The historical development of Mossbauer spectroscopy is briefly described from a chemist's viewpoint, and a critical assessment is made of its role in modern chemistry. (37 refs.)

62843 The understanding of nuclear structure through Mossbauer experiments. L.Grodzins (MIT, Cambridge, MA, USA).

Hyperfine Interactions (Netherlands), vol.13, no.1-3, p.57-64 (Jan. 1983).

Mossbauer's discovery vitalized the study of hyperfine interactions on nuclear states. The technique has been used to measure the electromagnetic moments of scores of nuclear levels and the results, especially on rotational states, have been important to the understanding of nuclear structure. Equally significant for nuclear physics has been the deep insight which Mossbauer studies have given us of the hyperfine interaction itself; using that knowledge, and a variety of techniques, the measurements of nuclear magnetic moments are now reliable and routine. (20 refs.)

62844 Mossbauer spectroscopy of implanted sources. L.Niesen (Lab. voor Algemene Natuurkunde, Materials Sci. Centre, Groningen, Netherlands).

Hyperfine Interactions (Netherlands), vol.13, no.1-3, p.65-88 (Jan. 1983).

A review is given of the field of Mossbauer spectroscopy of ion-implanted sources. After an introduction to the various aspects of the ion-implantation method, the following topics are treated: final site selection of implanted impurities; trapping of defects at implanted ions, on-line implantation; implantation in metals, semiconductors and insulators. (93 refs.)

62845 Mossbauer studies of valence fluctuations. I.Nowik (Racah Inst. of Phys., Hebrew Univ., Jerusalem, Israel).

Hyperfine Interactions (Netherlands), vol.13, no.1-3, p.89-118 (Jan. 1983).

In the last ten years the Mossbauer technique has made a considerable contribution to the research of the phenomena of mixed valencies, valence instabilities, valence fluctuations and intermediate valencies of transition elements. The sensitivity of the hyperfine interaction parameters and in particular the isomer shift, to the valency of the Mossbauer ion, enabled the research of dynamics of valence fluctuations and the temperature, pressure and composition dependence of the ionic intermediate valence state. Studies of ^{149}Sm , ^{152}Sm and ^{153}Eu in $\text{Sm}_{1-x}\text{R}_x$ contributed to the understanding of the outstanding insulator-metal phase transition that occurs in these systems. (57 refs.)

62846 ^{67}Zn Mossbauer spectroscopy. T.Katila, K.Riski (Dept. of Tech. Phys., Helsinki Univ. of Technol., Espoo, Finland).

Hyperfine Interactions (Netherlands), vol.13, no.1-3, p.119-48 (Jan. 1983).

Investigations on ^{67}Zn Mossbauer spectroscopy are reviewed. In the theoretical part, mainly phenomena to be observed due to the long nuclear lifetime of the Mossbauer state are discussed. Such phenomena include e.g. transient effects due to the phase modulation, the exceptionally large relative contribution of the second order Doppler shift and the narrowest line width observable today. Finally, a historical review of the ^{67}Zn Mossbauer measurements is presented. Results of the experimental investigations of various research groups are given in chronological order. (59 refs.)

62847 Mossbauer spectroscopy with $^{191,193}\text{Ir}$. F.E.Wagner (Phys.-Dept., Tech. Univ. München, Garching, Germany).

Hyperfine Interactions (Netherlands), vol.13, no.1-3, p.149-73 (Jan. 1983).

The contributions made by Ir Mossbauer spectroscopy to the determination of nuclear parameters, as well as applications in solid state physics and chemistry, are reviewed. In addition, a brief description of experimental techniques and source preparation procedures is given. (141 refs.)

- 62848 Mossbauer spectroscopy with actinide elements.** W.Potzel, J.Moser, L.Asch, G.M.Kalvius (Phys. Dept., Tech. Univ. Munchen, Garching, Germany). *Hyperfine Interactions (Netherlands)*, vol.13, no.1-3, p.175-98 (Jan. 1983). Although formally equivalent to the lanthanide (4f) elements, the light actinides show a much more varied behaviour due to the larger spatial extent and ionizability of the 5f electrons. The application of Mossbauer spectroscopy for the determination of electronic properties of the actinides is outlined. Emphasis is put on high pressure Mossbauer experiments using the 60 keV transition in ^{237}Np to study questions of delocalization of 5f electrons. (58 refs.)
- 62849 Experimental techniques for conversion electron Mossbauer spectroscopy.** J.A.Sawicki (Inst. of Phys., Jagellonian Univ., Cracow, Poland), B.D.Sawicka. *Hyperfine Interactions (Netherlands)*, vol.13, no.1-3, p.199-219 (Jan. 1983). Conversion electron Mossbauer spectroscopy has grown during the last decade as a new tool of surface science. High sensitivity, depth selectivity and capabilities of the method in nondestructive backscattering analysis are essential features of CEMS. These virtues made the method advantageous in various applications and stimulated considerable progress in experimental techniques. The latter is the subject of the present paper. (83 refs.)
- 62850 Isomer shift reference scales.** J.G.Stevens (Mossbauer Effect Data Center, Univ. of North Carolina, Asheville, NC, USA). *Hyperfine Interactions (Netherlands)*, vol.13, no.1-3, p.221-36 (Jan. 1983). The relative isomer shift values of materials commonly used as source and absorber standards for 17 common Mossbauer transitions have been evaluated. This data allows the comparison of isomer shifts among various laboratories despite differences in standards used as zero velocity standards. (3 refs.)
- 62851 Mossbauer-spectroscopic study of solid solutions based on cementite and chromium carbides.** Yu.I.Archakov, L.N.Seregina (All-Union Sci.-Res. Inst. of Petrochem. Processes, USSR). *Inorg. Mater. (USA)*, vol.18, no.5, p.673-6 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.800-4 (May 1982). [received: Feb. 1983] Solid solutions based on Fe_3C and Fe-Cr carbides with limiting concentration of iron have been investigated by means of Mossbauer spectroscopy on the isotope ^{57}Fe . The Mossbauer spectrum of $(\text{Cr}_{0.7}\text{Fe}_{0.3})_{23}\text{C}_6$ is a broadened line, and that of $(\text{Cr}_{0.5}\text{Fe}_{0.5})_3\text{C}_3$ is a doublet. The parameters of these spectra change only very slightly with temperature. The fine structure of the spectra of $(\text{Fe}_{1-x}\text{Cr}_x)_3\text{C}$ depends on the temperature. (10 refs.)
- 62852 A Mossbauer spectroscopic study of the six-coordinate high-spin ferrous compound (meso-tetraphenylporphinato)bis(tetrahydrofuran) iron(II).** B.Boso, G.Lang (Dept. of Phys., Pennsylvania State Univ., University Park, PA, USA), C.A.Reed. *J. Chem. Phys. (USA)*, vol.78, no.5, p.2561-7 (1 March 1983). Mossbauer spectra of a polycrystalline form of the six-coordinate high-spin ferrous compound (meso-tetraphenylporphinato)bis(tetrahydrofuran) iron(II) have been recorded over a range of temperatures (4.2-195K) and magnetic fields (0-6.0 T). Analysis of the spectra using a phenomenological model of the internal magnetic field and using an $S=2$ spin Hamiltonian, where applicable, yield the sign of V_{zz} negative, $\eta=0.4$, $D=6.0\text{ cm}^{-1}$, $E/D=0.1$, and $A^*g^*\nu_B = (-7.2, -7.2, \text{ and } -24.3\text{ T})$. These results suggest that the iron experiences an octahedral crystal field trigonally distorted in the (1,1,1) direction, producing a prolate orbital d_{z^2} as the ground state. Crystal field calculations confirm this interpretation by reproducing the spin Hamiltonian parameters listed above. The calculation predicts an orbital doublet 1667 cm^{-1} above the ground state. Comparisons with deoxyheme proteins and their synthetic analogs suggest some common gross features of the orbital state and structure-related trends in the character of the ground quintet. (27 refs.)
- 62853 Mossbauer diffraction on a single rotating crystal.** E.V.Zolotobajko, E.M.Jolin, A.V.Murmov (Inst. of Phys., Acad. of Sci., Riga, Latvian SSR). *J. Phys. D (GB)*, vol.16, no.4, p.697-704 (14 April 1983). The problem of coherent scattering of Mossbauer radiation in the case of a single rotating crystal is considered. It is shown that the resulting additional Doppler shift leads to the frequency dependence of the purely elastic intensity I_{el} . Due to the small value of the Mossbauer line width the intensity I_{el} is sensitive to small deviations of the reciprocal lattice vector from the rotating axis. In order to check the theoretical considerations, the Mossbauer diffraction experiment was carried out on a single pyrolytic graphite crystal. The authors analysed the influence of the mosaic structure of the sample as well as the deflection by the atomic planes from the crystal surface on the obtained results. (12 refs.)
- 62854 Mossbauer spectroscopic studies of magnesium nickel ferrites.** K.Seshan, A.S.Bommannavar, D.K.Chakrabarty (Dept. of Chem., Indian Inst. of Technol., Bombay, India). *J. Solid State Chem. (USA)*, vol.47, no.1, p.107-12 (15 March 1983). Mossbauer spectra of magnesium nickel ferrites having a spinel structure with varying percentages of nickel were obtained at room temperature. The split extreme high-resonance line could be resolved into two Lorentzians from which the cation distribution was calculated. The calculated cation distributions match very well with those obtained from magnetization measurements as well as from ferromagnetic resonance studies on the same samples. The observed quadrupolarly split and the hyperfine field values can be rationalized, based on the obtained cation distributions. (9 refs.)
- 62855 Mossbauer effect study of the internal magnetic field in small iron particles.** I.Tamura, M.Hayashi (Phys. Dept., Toyama Medical & Pharmaceutical Univ., Toyama, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.945-6 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). A temperature and size dependent enhancement of the internal magnetic field was observed for small iron particles produced by the gas evaporation technique and was explained by the demagnetization field and the dipole interaction of the particles. Thermal fluctuation of the magnetization and fusion between the particles have important effects. (5 refs.)
- 62856 Magnetic excitations in small NiFe_2O_4 particles.** K.Haneda, H.Kojima (Res. Inst. for Sci. Measurements, Tohoku Univ., Sendai, Japan), A.H.Morrish. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.951-2 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). Mossbauer absorption spectra for small NiFe_2O_4 particles with and without applying a high magnetic field have been discussed in connection with the apparently anomalous ratios of the B to A-site pattern for a completely inverse spinel. Analyses indicate that the collective magnetic excitation mechanism is acting. (5 refs.)
- 62857 Magnetic and electronic properties of microcrystals of Fe_3O_4 .** S.Morup (Lab. of Applied Phys. II, Tech. Univ. of Denmark, Lyngby, Denmark), H.Topsøe. *J. Magn. & Magn. Mater. (Netherlands)*, vol.31-34, pt.2, p.953-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982). Mossbauer studies of 60 Å particles of Fe_3O_4 show the presence of a Verwey transition between 4.2K and 80K. The spectrum of superparamagnetic particles contains two lines with slightly smaller isomer shifts than those of the A and B sites in bulk. The B-site linewidth suggests a slower electron 'hopping' than in bulk. (12 refs.)
- 62858 Mossbauer study of acicular iron-nitride particles.** N.Sagusa, A.H.Morrish (Dept. of Phys., Univ. of Manitoba, Winnipeg, Manitoba, Canada), A.Tasaki, K.Tagawa, E.Kita. *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.123-5 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Acicular iron-nitride particles approximately 500 nm in length and 50 nm in diameter were studied by ^{57}Fe Mossbauer spectroscopy. At room temperature a ferromagnetic phase, probably $\gamma\text{-Fe}_4\text{N}$, coexists with a paramagnetic phase. (6 refs.)
- 62859 Mossbauer spectroscopic studies on surfaces and thin films.** J.Tyson, A.Owens, J.C.Walker (Dept. of Phys., Johns Hopkins Univ., Baltimore, MD, USA). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.126-9 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Investigates the magnetic properties of surface layers of Fe films using Mossbauer spectroscopy. (110) epitaxial Fe films were made of ^{56}Fe with appropriate probe layers of ^{57}Fe in the surface region. In this way the authors were able to profile the magnetism at and near the surface of the films. Studies of the temperature dependence of layers at the surface indicate a quasilinear dependence of magnetization on temperature while the temperature dependence of layers further inside the material show the usual $T^{3/2}$ dependence. A region of surface thermal spin deviations larger than bulk values extends over 3 to 4 layers at the surfaces. These results are in qualitative agreement with a number of theoretical studies. The quasilinear temperature dependence of the surface layer implies a weakening of the surface exchange. In addition to the unusual temperature dependence of the surface magnetization, the authors have generally observed larger surface magnetic hyperfine fields near $T=0$. (18 refs.)
- 62860 Surface magnetism of $\alpha\text{-Fe}_2\text{O}_3$ by Mossbauer spectroscopy.** T.Shinjo, M.Kiyama, N.Sugita, K.Watanabe, T.Takada (Inst. for Chem. Res., Kyoto Univ., Uji, Kyoto-fu, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.133-5 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). $\alpha\text{-Fe}_2\text{O}_3$ particles were prepared from pure ^{56}Fe and the surface was very thinly coated with ^{57}Fe . Mossbauer results elucidated that the surface hyperfine field rapidly decreased with increase of temperature but the Morin transition took place at the same transition temperature as the bulk crystal. (7 refs.)
- 62861 Interface magnetism in Fe-Sb multilayer films from ^{121}Sb and ^{57}Fe Mossbauer spectroscopy.** J.M.Friedt, N.Hosoi, K.Kawaguchi, T.Shinjo (Centre de Recherches Nucleaires, Strasbourg, France). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.136-8 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Intense electronic charge and spin density perturbations occur at Sb-Fe interfaces by reference to bulk materials. The authors report the observation of a large hyperfine field (i.e. spin density) being transferred from the magnetic layer (Fe) into the nonmagnetic one (Sb) at the Fe-Sb interface. (12 refs.)
- 62862 Mossbauer and X-ray diffraction studies of amorphous Fe-Ni alloy films deposited by DC sputtering.** J.Arai, S.Nagata, M.Shirasaki (Faculty of Sci. & Technol., Sci. Univ. of Tokyo, Chiba, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.221-2 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The analysis of the Mossbauer spectra reveals that the amorphous Fe-Ni alloy films without metalloid produced by DC sputtering have strong uniaxial magnetic anisotropy perpendicular to the film plane and the hyperfine field in the amorphous state is larger than that in the crystalline state in Invar composition. (3 refs.)
- 62863 Application of the depth-selective conversion electron Mossbauer spectroscopy to rare-earth iron garnet films.** J.Itoh, Y.Yonekura, K.Saneyoshi, T.Toriyama, K.Hisatake (Dept. of Appl. Phys., Tokyo Inst. of Technol., Tokyo, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.340-2 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). Mossbauer spectra of RIG were measured with an electron spectrometer for energies of 7.3, 7.1 and 6.6 keV. The spectra for 0-100, 100-300 and 300-1500 Å were deduced. Spin-orientation, area ratio of d- to a-site and line widths are derived as a function of depth. (4 refs.)
- 62864 Depth-selective conversion electron Mossbauer spectroscopy of thin Fe films.** S.Staniek, T.Shigematsu, W.Keune, H.-D.Pfannes (Lab. für Angewandte Phys., Univ. Duisburg, Duisburg, Germany). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.347-9 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). The depth-sensitivity of energy-differential conversion electron Mossbauer spectroscopy (DCEMS) was tested by using a 50 Å ^{57}Fe film evaporated onto 1320 Å natural Fe and coated by 0, 50 and 100 Å natural Fe. The average hyperfine field of 34 Å ^{57}Fe on 340 Å ^{56}Fe was found to be slightly smaller than ($\sim 326\text{ kOe}$) the bulk field. Surface effects were drastically enhanced if Auger electron Mossbauer spectroscopy (AEMS) at 600 eV was performed. (10 refs.)
- 62865 Applied magnetic field Mossbauer studies of the quasi one-dimensional system $\text{AFES}_2\text{A}=\text{K, Rb, Cs}$.** D.M.Cooper, D.P.E.Dickson (Dept. of Phys., Univ. of Liverpool, Liverpool, England), P.H.Domingues, G.P.Gupta, C.E.Johnson, M.F.Thomas, C.A.Taft, P.J.Walker. *J. Magn. & Magn. Mater. (Netherlands)*, vol.36, no.1-2, p.171-4 (1 April 1983). Mossbauer measurements of single crystal and quasi single crystal samples of AFES_2 compounds show no evidence for any variation of the hyperfine field with applied fields up to 10.0 T. This is consistent with what would be expected in a quasi one-dimensional system with relatively high anisotropy,

and does not preclude a contribution to the anomalously low value of the saturation hyperfine field from zero point spin reduction effects. (10 refs.)

62866 Mixed-valent iron in synthetic rasumite, KFe_2S_3 . G.Amthauer (Inst. for Mineralogie, Univ. Marburg, Marburg, Germany), K.Bente. *Naturwissenschaften (Germany)*, vol.70, no.3, p.146-7 (March 1983). The authors synthesize rasumite and obtain additional experimental information on the temperatures and pressures of its formation in nature. They also determine the valence state of iron by means of Mossbauer spectroscopy of ^{57}Fe . (7 refs.)

62867 Selective scattering of electromagnetic radiation in radio-frequency resonance conditions. A.V.Mitin. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.168-72 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.288-95 (Aug. 1982). [received: April 1983]

A theory is developed for the selective scattering of radiation by a system with discrete energy levels under conditions of radio-frequency resonance. The problem is solved with the assumption of spontaneous reemission while the rotating RF field is considered. On the basis of simultaneous solution of the system of equations for the density-matrix elements the presence of beats is demonstrated for scattered-radiation intensity at a frequency that is a multiple of the RF field frequency. It was noticed that at large RF field intensities a significant role in scattering is played by interference induced by the latter. Scattered-radiation polarization is considered. Results are analyzed using the example of Mossbauer scattering on Fe^{2+} nuclei in iron. (21 refs.)

62868 Quadrupole interactions at ^{111}Cd nuclei in light rare earths. S.N.Mishra, R.G.Pillay, P.N.Tandon, H.G.Devare (Tata Inst. of Fundamental Res., Bombay, India).

Phys. Lett. A (Netherlands), vol.94A, no.6-7, p.317-19 (21 March 1983). Quadrupole interactions at ^{111}Cd nuclei introduced as dilute impurity in light rare-earth hosts have been studied using the TDPAC technique. The electronic enhancement of the electric field gradient is found to be almost independent of the rare earth in the first half of the series contrary to a steep decrease in the second half with a sharp change at Gd. (11 refs.)

62869 The Mossbauer effect on ^{57}Fe nuclei in magnesium, yttrium and beryllium matrices. R.B.Yadav (Phys. Dept., S.D.P.G. Coll., Muzaffarnagar, India).

Physica B & C (Netherlands), vol.115 B+C, no.2, p.237-9 (Jan. 1983). The probability of recoilless resonant absorption of 14.4 keV γ -rays by ^{57}Fe in matrices of magnesium, yttrium and beryllium has been calculated in the temperature range 42-929K, respectively. The calculated results show good agreement with the experimental data. (9 refs.)

62870 Conversion Mossbauer studies of epitaxially mixed ferrite-garnet films. Sh.Sh.Bashkurov, N.G.Ivovlov, E.S.Romanov, A.P.Kirmenskii (V.I. Ulyanov-Lenin State Univ., Kazan, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1497-500 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2641-7 (Sept. 1982). [received: April 1983]

Mossbauer, X-ray diffraction, and magnetooptical measurements are used to investigate epitaxial films with composition $(\text{YEuTmCa})_x(\text{FeGe})_{1-x}\text{O}_{12}$ grown on (111) Gd_2GaO_7 substrates. The local magnetic fields $H_{\text{eff}}^{\text{Fe}}$ and $H_{\text{eff}}^{\text{Gd}}$ on the nuclei of Fe^{3+} ions in octahedral and tetrahedral sites are measured. The coefficient of magnetic misorientation is found in the case of misoriented (111) films in the GaGe system. The effectiveness of determining the degree of diamagnetic substitution x using the Mossbauer conversion spectroscopy method is demonstrated. The films, even grown from a single solution melt under identical conditions, show considerable scatter with respect to the quantity x . Starting from the dependences of the values of $4\pi M_s$ on x , it is concluded that the concentration of Ge^{4+} ions is different in the surface and lower-lying layers. (22 refs.)

(inc. muon probe studies)

62871 Some characteristics of muon states in silicon. C.Boekema (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Philos. Mag. B (GB), vol.47, no.3, p.331-6 (March 1983). Recent results of muon spin rotation studies on silicon are discussed. Special attention is paid to the temperature and doping dependences of the formation probabilities and relaxation rates of the observed muon states. It is argued that normal muonium (Mu) and anomalous muonium (Mu^*) are two completely different states with respect to physical and chemical properties. Mu^* is a localized state, whereas evidence suggests that Mu diffuses through the silicon lattice. (16 refs.)

77.00 DIELECTRIC PROPERTIES AND MATERIALS

(for conductivity phenomena, see 72.20 and 72.80)

77.20 PERMITTIVITY

62872 Dielectric properties of $\text{Ag}_{1-x}\text{K}_x/\text{NbO}_3$ solid solutions. M.Lukas-zewski (Inst. of Phys., Silesian Univ., Katowice, Poland).

Ferroelectr. Lett. Sect. (GB), vol.44, no.11, p.319-24 (1983). The possibility of the occurrence of a critical point in $(\text{Ag}_{1-x}\text{K}_x)\text{NbO}_3$ solid solutions is discussed. (7 refs.)

62873 Precise millimeter-wave measurements of complex refractive index, complex dielectric permittivity and loss tangent of GaAs, Si, SiO_2 , Al_2O_3 , BeO, Macor, and glass. M.N.Afsar, K.J.Button (MIT, Cambridge, MA, USA). *IEEE Trans. Microwave Theory & Tech. (USA)*, vol.MTT-31, no.2, p.217-23 (Feb. 1983).

Highly accurate continuous spectra of the complex refractive index and complex dielectric permittivity are given in the millimeter range for a variety of potentially useful materials. The absorption coefficient is found to increase monotonically with increasing frequencies. Small amounts of glassy inclusions or water were found to increase losses at all frequencies, but impurities and radiation damage (except in semiconductors) have not yet proved to be detrimental to performance. Materials have been found for which the millimeter-wave losses can be tolerated when used as dielectric waveguide, high-power windows, and other applications. Nominal consideration must be given, however, to the conditions of preparation and the nature of contaminants. The measurements were made in a modular, polarizing, dispersive Fourier-transform spectrometer. (9 refs.)

62874 Dielectric constant of both amorphous and crystalline PbTiO_3 at low temperatures. Y.Miura, M.Takashi, T.Nakamura (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan), W.N.Lawless, M.Shinohara, T.Furubayashi, N.Nishida, Y.Takano, H.Ishimoto, K.Ohno. *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.4, p.1127-30 (April 1983).

The dielectric constant of PbTiO_3 in both amorphous and crystalline states has been measured down to 18 mK at several frequencies in the range between 0.3 and 100 kHz. In each state, the dielectric constant around 100 mK has a frequency-dependent minimum, which is characteristic of a vitreous state.

62875 Dielectric dispersion in KH_2PO_4 below 10K. H.Motegi, K.Kuramoto, E.Nakamura (Faculty of Sci., Hiroshima Univ., Hiroshima, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.4, p.1131-3 (April 1983).

Complex dielectric constants of KH_2PO_4 along the c and a -axes have been measured in the frequency range from 10 Hz to 20 kHz. Dielectric dispersions of relaxation type with small loss peaks have been observed at temperatures below 10K in both directions. Arrhenius plots of the relaxation frequencies give extremely small values of activation energies, 0.014 eV for the c -axis and 0.004 eV for the a -axis, respectively. (6 refs.)

62876 Dielectric and piezoelectric properties of modified lead titanate zirconate ceramics from 4.2 to 300K. X.L.Zhang, Z.X.Chen, L.E.Cross, W.A.Schulze (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA).

J. Mater. Sci. (GB), vol.18, no.4, p.968-72 (April 1983). The dielectric and piezoelectric properties (d-p properties) of four kinds of doped lead titanate zirconate piezoelectric ceramics (PZTs) have been measured from 4.2 to 300K. The d-p properties of the materials converge with decreasing temperature down to liquid helium temperature, even though the properties have large differences at room temperature. The values of mechanical and electrical quality factors, Q_m , Q_e , and of the frequency constant, N , of the materials increased at low temperature. It is evident from the freeze out in K' and the associate temperature-frequency-dependent maxima in $\tan \delta$ that the relaxation processes including ferroelectric domain wall motion and thermal defect motion contribute to the d-p properties. The Navy type-II composition has a minimum temperature coefficient of d-p parameters and it is evident that PZT ceramics modified with Fe_2O_3 can provide good stability and also give the strongest piezoelectric response at liquid helium temperature. (8 refs.)

62877 Growth and some dielectric properties of K_2ZnCl_4 and Rb_2ZnCl_4 crystals. O.E.Bochkov, Yu.D.Krokhmal', S.A.Flerova, A.Yu.Kudzin (State Univ., Dnepropetrovsk, USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.27, no.5, p.603-4 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1005-6 (Sept.-Oct. 1982). [received: April 1983]

The authors give the results of an investigation of the technology for obtaining K_2ZnCl_4 and Rb_2ZnCl_4 crystals, both in the pure state and doped with copper and cobalt ions. The crystals were grown by two methods: (i) by isothermal evaporation from saturated aqueous solutions; (ii) by pulling from a melt by the Czochralski method. The starting materials were potassium, rubidium, and zinc chlorides of commercial very pure and analytical-reagent grades (os.ch. and ch.d.a.). They were grown from aqueous solution both by spontaneous crystallization and by a dynamic method with seed crystals. The authors also performed experiments on the growth of crystals from solutions containing excess zinc chloride. Combined dielectric measurements were made on the crystals. A comparative analysis enabled the authors to relate the

difference in the dielectric behaviour of the crystals to the growth conditions. (3 refs.)

62878 Grain orientation and dielectric properties of ferroelectric BaBi₂Ti₄O₁₅ ceramic thick film. Z.-T. Zhang, K. Koumoto, H. Yanagida (Dept. of Industrial Chem., Univ. of Tokyo, Tokyo, Japan). *Yogyo-Kyokai-Shi (Japan)*, vol.90, no.1048, p.709-14 (1982). The effect of grain orientation on dielectric properties of a ferroelectric BaBi₂Ti₄O₁₅ ceramic thick film fabricated by a modified doctor blade method was investigated. For evaluation of the grain orientation, the equation $f = P_0 / (W_{\text{hkl}} - 1) / (1 - P_0)$ proposed by Zhang was fully examined and the degree of orientation F was newly defined. The F value for each crystal plane was calculated from an X-ray diffraction pattern, which was further correlated with the measured permittivity and dielectric loss ($\tan \delta$). The diffraction intensity of the crystal planes perpendicular to c -axis such as (008) and (0010) was observed to be higher than that for a non-oriented sample and resulted in $F > 0$. The intensity of the crystal planes parallel to c -axis such as (020), on the other hand, was lower, resulting in $F < 0$. The permittivity of a film was smaller than that of a normally sintered specimen in the temperature range 15°~480°C. It was concluded that the permittivity along c -axis was smaller than that along a - or b -axis for BaBi₂Ti₄O₁₅. (13 refs.)

77.30 POLARIZATION AND DEPOLARIZATION EFFECTS

62879 Spatially varying polarization in ice. D.W.R.Gruen, S.Marcelja (Dept. of Appl. Math., Australian Nat. Univ., Canberra, Australia). *J. Chem. Soc. Faraday Trans. II (GB)*, vol.79, pt.2, p.211-23 (Feb. 1983).

The authors calculate the response of an ice crystal to a spatially varying applied electric field. The dielectric polarization of the ice is not assumed to be proportional to the local macroscopic electric field. Instead, the authors formulate an expression for the free-energy density of an ice crystal with non-uniform polarization and derive the functional forms of the electric and polarization fields which minimize the free energy of the whole system. In general, the two fields have different spatial variation. Their behaviour is governed by two characteristic lengths: the Debye length and a polarization decay length, determined, respectively, by the concentration of ions and Bjerrum defects in bulk ice. The model is a generalized Poisson-Boltzmann theory which includes the effects of the microscopic structure of the medium in a description of electrostatic screening of external charges. (11 refs.)

62880 Spatially varying polarization in water. A model for the electric double layer and the hydration force. D.W.R.Gruen, S.Marcelja (Dept. of Appl. Math., Australian Nat. Univ., Canberra, Australia). *J. Chem. Soc. Faraday Trans. II (GB)*, vol.79, pt.2, p.225-42 (Feb. 1983).

The response of aqueous solutions to a spatially-varying applied electric field is modelled. This leads to a generalized theory of the electric double layer which explicitly takes into account the microscopic structure of the solvent. As the solvent polarization is allowed to vary depending on both the macroscopic electric field and the specific interactions at the surface, the result is more freedom in the structure of the electric double layer. Generalized expressions are considered for the double-layer free energy, as well as the interaction of two double layers which include specific surface polarization. Such interaction consists of both classical double-layer repulsion and the strong, short-range 'hydration force'. (23 refs.)

62881 Thermally stimulated surface currents in CH₃OH cryocondensates near the polymorphic phase transformation. J.Chrzanowski, B.Sujak (Inst. of Experimental Phys., Univ. of Wrocław, Wrocław, Poland). *Thin Solid Films (Switzerland)*, vol.101, no.2, p.123-30 (11 March 1983).

Thermally stimulated surface currents (TSSCs) were measured in thin methanol cryocondensates after deposition of the layer onto a substrate at a temperature of 80K from a molecular beam followed by heating at a constant rate. It was found that the TSSC curves exhibit some local maxima. One of these peaks was found near $T = 158K$, i.e. in the temperature range where solid methanol undergoes a polymorphic phase transformation. The current-voltage characteristics obtained for these layers suggest fundamental changes in the electrical properties of the condensate surface that take place near this transformation ($\alpha \rightarrow \beta$). The current-voltage curve obtained at $T = 158K$ for the solidified methanol layer studied shows a similar shape to that of the current-voltage curves observed in dielectric materials within the space-charge limited current range. 77.40 DIELECTRIC LOSS AND RELAXATION

62882 Pressure-dependent secondary relaxation in a series of vinyl chloride-vinyl acetate copolymers. J.Krishnan, N.Sharma, K.K.Jain (Nat. Phys. Lab., New Delhi, India).

High Temp.-High Pressures (GB), vol.14, no.3, p.293-306 (1982). (10th Plansee Seminar on 'Trends in Refractory Metals, Hardmetals, and Special Materials, and their Technology', Reutte, Austria, 1-5 June 1981).

Depolarisation behaviour of solution-grown vinyl chloride-vinyl acetate copolymer films having 3, 10, and 17 wt.% concentration of vinyl acetate (VAc) have been studied as a function of the externally applied hydrostatic pressure and the poling field. A relaxation peak in the temperature region of 340-360K at 1 bar is observed with activation enthalpies of 0.66-0.78 eV and relaxation times at 300K of $(6.06-22.7) \times 10^{-3}$ s respectively. The magnitude of the maximum current, and hence the charge associated with it, increases linearly with the poling field and is attributed to a local twisting of the main chain or side-group motion. At higher pressure two peaks at about 330 and 360K are observed and are attributed to localised molecular motion of the main chain in two regions of different activation volumes. The shift in the peak position towards lower temperature with increase in VAc concentration could imply that VAc acts as a plasticiser loosening the entangled main polymer chain and hence increasing the mobility of the molecular motion. The shift to the higher temperature is then mainly dominated by the decrease in the free volume by applied pressure which increases the relaxation time of the molecular motions. The principal characteristics of the polymer, including the activation volume, activation enthalpy, and relaxation time of the molecular motion, have been computed. (27 refs.)

62883 Dielectric properties of 1-cyanoadamantane C₁₀H₁₅CN, in its plastic phase. J.P.Amoureux, M.Castelain, M.D.Benadda, M.Bee, J.L.Sauvageol. *J. Phys. (France)*, vol.44, no.4, p.513-20 (April 1983).

Dielectric properties of 1-cyanoadamantane C₁₀H₁₅CN are analysed in a very wide frequency band (10^{-10} Hz) between 200K and 400K. Dynamical relaxation effects are studied in relation to the structure of the plastic phase. The temperature variations of both single and correlated molecular motions are investigated. The results the authors obtain for the single molecular motions agree exactly with the corresponding ones deduced from NMR. The experimental Kirkwood correlation g factor indicates an anti-parallel local order in all the plastic phase of cyanoadamantane. (26 refs.)

62884 Laws governing dielectric relaxation. J.H.Calderwood (Dept. of Electronic Engng., Univ. Coll., Galway, Ireland). *J. Phys. C (GB)*, vol.16, no.10, p.L301-3 (10 April 1983).

A notional experiment has previously been described concerning the current decay curves in two identical dielectric specimens, each previously subjected for a long period to a constant electric field, and short-circuited at different times, the specimen subjected to the higher field being short-circuited first. If the polarisation mechanism exhibits a distribution of relaxation times, the current decay curves may cross over each other; on the other hand the mechanism is such that the current decay obeys a $t^{-1/2}$ law, then the curves will certainly cross over. Such a cross-over gives rise to certain apparent conceptual difficulties which are easily dealt with if a distribution of relaxation times is postulated, but otherwise remain to be explained. (3 refs.)

62885 A transient-state theory of dielectric relaxation and the Curie-von Schweidler law. T.C.Guo, W.W.Guo (IIT Res.Inst., Annapolis, MD, USA). *J. Phys. C (GB)*, vol.16, no.10, p.1955-60 (10 April 1983).

A theory of dielectric response that accounts for the nonsteady-state nature of many-body interactions in transient processes is presented. It is shown that the theory leads to the observed dielectric properties. Comparisons are also made with existing theories as regards their predictions, consequences and shortcomings. (13 refs.)

62886 Dielectric properties and structure of *N*-methylpropionamide+methanol mixtures. H.P.Bennetto, G.F.Evans, R.J.Sheppard (Queen Elizabeth Coll., Univ. of London, London, England). *J. Chem. Soc. Faraday Trans. II (GB)*, vol.79, no.1, p.245-51 (Jan. 1983).

The dielectric properties of mixtures of methanol with *N*-methylpropionamide (NMP) at 20°C have been investigated over the range of frequency 1 MHz to 4 GHz. The dielectric relaxation is described by a simple Debye dispersion equation, in contrast with the behaviour for many non-aqueous mixtures. An exponential dependence of the relaxation frequency on mole fraction composition reveals two distinct regions of dielectric response, attributed to methanol-dominated and NMP-dominated liquid structures. Results are discussed in terms of the polarisation of a homogeneous liquid of uniformly hydrogen-bonded structure, which varies with solvent composition. (24 refs.)

62887 Dielectric characteristic in V₂O₅ crystal and crystallized glass 70 V₂O₅.30P₂O₅. Y.Hakamatsuka, T.Tsuchiya, N.Yoneda (Faculty of Sci. & Technol., Sei. Univ. of Tokyo, Noda, Japan).

Yogyo-Kyokai-Shi (Japan), vol.90, no.1048, p.691-7 (1982). A large dielectric relaxation was observed in the crystallized glass containing a large amount of V₂O₅. The main crystalline precipitate in the crystallized glass 70V₂O₅.30P₂O₅ was V₂O₅ crystal. To clarify the origin of the large dielectric relaxation, the dielectric properties of the crystallized glass were studied and compared with those of polycrystalline V₂O₅ obtained by two different methods. The ϵ' of crystallized glass 70V₂O₅.30P₂O₅ is two or three times larger than that of the glass for the same composition. The sintered and oriented V₂O₅ polycrystalline materials show a large dielectric relaxation; the value of the static dielectric constant in the specimen sintered at 620°C for 5 h is 1000. The ϵ' of polycrystalline V₂O₅ changed with the sintering temperature and with the direction of the crystal axis in the oriented specimen. The results obtained were analyzed on the basis of the equivalent circuit model for a double-layer dielectric. According to this model, the ϵ' and σ of the crystal (the direction of b -axis) of the specimen oriented perpendicular to the electric field were 63 and 7.06×10^{-4} (mho/cm), respectively. (12 refs.)

77.50 DIELECTRIC BREAKDOWN AND SPACE-CHARGE EFFECTS

62888 Theoretical basis for the statistics of dielectric breakdown. R.M.Hill, L.A.Dissado (Chelsea Coll., Univ. of London, London, England). *J. Phys. C (GB)*, vol.16, no.11, p.2145-56 (20 April 1983). The statistics of dielectric breakdown processes are presented and compared with those derived from consideration of the fluctuation components of the dielectric response. It is shown that the Weibull statistic parameters have a direct physical meaning and that breakdown processes can be considered as cooperative events. (23 refs.)

62889 DC breakdown phenomena of the silicone oil/polymer film composite dielectrics. N.Narasaki, K.Kudo, S.Nishiyama. *Res. Rep. Fac. Eng. Meiji Univ. (Japan)*, no.43, p.55-60 (1982). In Japanese. Describes the investigation of breakdown phenomena of the silicone oil/polymer film composite dielectrics in a point-plane electrode system. DC breakdown voltages are measured as a function of water content in silicone oil, oil gap length and thickness of a polymer film. Variation of water content in silicone oil much affects the DC breakdown voltage with positive polarity. From the breakdown voltages with both polarities, it is found that polarity effect of each composite dielectric is dependent on conductivity of films. From the dependence on gap length of DC breakdown voltages, in case of applied voltage with positive polarity, breakdown voltages of composite dielectrics with PP, PET, Teflon FEP, and PA are always higher than those of only silicone oil in gap length, namely, the positive effect of composites is observed. On the other hand, in case of applied voltage with negative polarity, the negative effect of composites is observed in composite dielectrics with negative polarity, the negative effect of composites is observed in composite dielectrics with Teflon FEP, PP, PET in large gap length. This is caused by the influence of the electrification on the liquid/solid interface. (10 refs.)

62890 Generation of static dipole domains in dielectrics. G.N.Protsyuk, V.L.Uvarov. *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.7, p.344-5 (July 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.13-14, p.795-8 (July 1982). [received: April 1983]

Acoustic emission by electron avalanches generated in polymer dielectrics in a nonuniform injected-charge field was described previously (see *ibid.*, vol.7, p.226, 1981). A low-frequency modulation of the signal from the acoustic transducer was ascribed to the electric dipole field formed as a result of the stopping and localization of avalanche electrons. Borrowing terminology from semiconductor physics, the authors refer to this type of bipolar charge structure as a 'static dipole domain'. Here they report measurements of the domain parameters in polymethyl methacrylate near the emission threshold. The authors also analyze the nature of the phenomenon. (10 refs.)

77.60 PIEZOELECTRICITY AND ELECTROSTRICTION

(for piezo-optical effects, see 78.20H)

62891 Piezoelectric coefficients of AgGaSe_2 . H.Horinaka, H.Noouchi, H.Sonomura, T.Miyauchi (Dept. of Electrical Engng., Univ. of Osaka Prefecture, Osaka, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.546 (March 1983).

The ternary compounds I-III-V₂ and II-IV-V₂ crystallizing in chalcopyrite structure belong to the crystal class 42 m and consequently the piezoelectric tensor has three nonvanishing elements d_{14} , d_{25} , d_{36} . In this investigation, the measurement of the piezoelectric coefficients was made by a self-resonance method. Two kinds of samples, yz-bar and xy-bar, were prepared to determine d_{14} and d_{36} , respectively, by using the length-extensional mode. The piezoelectric coefficient can be calculated from the electro-mechanical coupling factor, the elastic compliance and the dielectric constant at constant stress. (3 refs.)

77.70 PYROELECTRIC AND ELECTROCALORIC EFFECTS

62892 Ferrielectricity of monoclinic RbD_2PO_4 . T.Osaka (Dept. of Appl. Phys., Sci. Univ. of Tokyo, Tokyo, Japan), M.Sumita, Y.Makita.

J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1124-6 (April 1983). The pyroelectric charge of monoclinic RbD_2PO_4 along the *b* axis was measured through the lower transition temperature at 44°C (T_H) and the *D-E* hysteresis curves were examined below T_H . The *D-E* triple hysteresis loops were observed below T_H , corresponding to the development of a small pyroelectric charge below T_H . It is clarified that the crystal is ferrielectric below T_H with a small net polarization, 0.02 $\mu\text{C}/\text{cm}^2$, compared with the spontaneous polarization of the sublattice, 1.8 $\mu\text{C}/\text{cm}^2$, at 30°C.

62893 Temperature dependence of the pyroelectric coefficient of polar dielectrics. V.K.Novik, B.G.Bochkov, N.D.Gavrilova, S.N.Drozhdin. *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.8, p.427-8 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.988-92 (Aug. 1982). [received: April 1983]

The authors measured the pyroelectric coefficients of some classical pyroelectrics—tourmaline and some group A^{II}B^{VI} crystals (ZnO, CdS, and BeO)—by the static method. (9 refs.)

77.80 FERROELECTRICITY AND ANTIFERROELECTRICITY

62894 Characterization of the three dimensional properties of poled PZT 65/35 in the absence of losses. P.J.Chen (Sandia Nat. Lab., Albuquerque, NM, USA).

Acta Mech. (Austria), vol.47, no.1-2, p.95-106 (1983).

The author characterizes the isothermal three dimensional properties of a poled ferroelectric ceramic PZT 65/35 in the absence of losses. The resulting constitutive relations, in the absence of mechanical dissipation, domain switching, dipole dynamics and phase transformation, are the standard ones which appear in the literature. The characterization of the constitutive relations requires the determination of five elastic constants, three piezoelectric constants and two dielectric constants. The author identifies the experimental measurements which are sufficient to determine these constants and describes the data reduction procedures. His results differ relatively and absolutely from those given in the literature. (11 refs.)

62895 Dielectric dispersion of relaxor ferroelectrics (SBN 75 and PLZT 8/65/35). O.Kersten, A.Rost, G.Schmidt (Sektion Phys., Martin-Luther-Universität, Halle, Germany).

Phys. Status Solidi a (Germany), vol.75, no.2, p.495-500 (16 Feb. 1983).

The temperature dependence of the complex dielectric constant of $\text{Sr}_{0.75}\text{Ba}_{0.25}\text{Nb}_2\text{O}_6$ single crystals and of PLZT 8/65/35 ceramics is measured at frequencies between 10 and 10^{10} Hz. The results can be described by Cole-Cole circles. The distribution of relaxation times decreases with increasing temperature. The activation energies are 0.45 and 0.42 eV, respectively. These results corroborate the idea of two-level system-type disorder modes. (15 refs.)

62896 A possible model of the process of repolarization of a ferroelectric in a weak electric field. E.V.Burtsev, S.P.Chervonobrodov (State Univ., Rostov, USSR).

77.80B Transitions and Curie point

62897 Ferroelectric properties of tungsten bronze lead barium niobate (PBN) single crystals. T.R.Shrouf, L.E.Cross (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA), D.A.Hukin.

Ferroelectr. Lett. Sect. (GB), vol.44, no.11, p.325-30 (1983).

A ferroelectric tungsten bronze single crystal of $\text{Pb}_{0.35}\text{Ba}_{0.75}\text{Nb}_2\text{O}_6$ was grown from a melt using the Czochralski technique. The crystal belongs to the tetragonal point group 4 mm with the spontaneous polarization parallel to the 'c' axis. The room temperature lattice parameters were $a=12.50$ Å and $c=3.995$ Å. The spontaneous polarization was found to be 0.40 C/m²°C. The

Curie transition was 350°C as determined from the temperature dependence of the dielectric constants. The pyroelectric properties were found to be typical of other tetragonal ferroelectric bronzes. Dielectric constant ϵ_{11} and piezoelectric constant d_{33} show a strong enhancement from the approach of the tetragonal:orthorhombic morphotropic phase boundary and it is clear that crystals with composition in the tetragonal phase field closer to this boundary will be of major interest for piezoelectric and electro-optic applications. (13 refs.)

62898 Concentration dependences of the Curie-Weiss coefficients, dielectric nonlinearity and electrostriction in (Ba,Sr)TiO₃ solid solutions. O.P.Zdebskii, O.U.Savchuk. *Dopov. Akad. Nauk UkrSR. Ser. A (USSR)*, no.2, p.50-2 (1983). In Ukrainian.

Analyses the distinction between the Devonshire-Ginsburg expansion coefficients, obtained experimentally and those resulting from the theory of the first-order phase transitions on the basis of the dependence of dielectric nonlinearity coefficients on a uniaxial mechanical pressure. (8 refs.)

62899 Optical method of determining the Curie point displacement in ferroelectric crystals under external effects. B.G.Mytsyk, N.A.Romanyuk (I. Franko State Univ., Lvov, Ukrainian SSR).

Ind. Lab. (USA), vol.48, no.6, p.581-3 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.48-50 (June 1982). [received: March 1983] An optical method is proposed for determining the Curie point shift ΔT_c which is simpler in practical accomplishment as compared with electrical methods and is assured by a simple polarization-optics apparatus with photoelectrical recording of the optical radiation. (7 refs.)

62900 Fluctuations of composition and phase transition in ferroelectric SbSe_{0.40}Sn_{0.60}I. M.H.Amaral, M.R.Chaves (Lab. de Fisica, Univ. do Porto, Porto, Portugal), A.Levelut, S.Ziolkiewicz. *Port. Phys. (Portugal)*, vol.13, no.3-4, p.173-83 (1982).

The pyroelectric coefficient (λ) was investigated in crystals of SbSe_{0.40}Sn_{0.60}I and a notorious broadening of the transition when x increases is verified. Spontaneous polarization (P_s) for SbSe_{0.40}Sn_{0.60}I is deduced from λ and the broadening of the transition is analysed by assuming a non-homogeneous distribution of Se atoms through the sample. (9 refs.)

62901 Nature of the phase transition in K_{1-x}TaO₃. J.J.van der Klink, D.Rytz (Inst. of Experimental Phys., Swiss Federal, Inst. of Technol., Lausanne, Switzerland).

Phys. Rev. B (USA), vol.27, no.7, p.4471-4 (1 April 1983). The authors present dielectric, elastic, and NMR measurements that point at the special character of the phase transition in K_{1-x}Na_xTaO₃ mixed crystals. At the onset of birefringence, a critical behavior is observed in the dielectric constant and in the elastic compliance, whereas the NMR measurements do not reflect any criticality. It is suggested that, related to the transition, an off-center displacement of the sodium ions of less than 0.1 Å occurs. (19 refs.)

62902 Incommensurate phase and dielectric properties of crystals in the NaK-tartrate/NaNH₄-tartrate system. V.V.Gladkii, S.N.Kallaev, V.A.Kirikov, L.A.Shuvalov, N.M.Shechagina (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).

Sov. Phys-Solid State (USA), vol.24, no.9, p.1488-90 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2626-30 (Sept. 1982). [received: April 1983]

The results are given from a study of the dielectric properties arising from the dependence of the macroscopic quadrupole moment on the external mechanical stress and on the temperature of crystals of the NaK_{1-w}(NH₄)₂ tartrate system with $w=0.4$ and 0.85 (group III) or $w=0.94$ and 1 (group IV) near the ferroelectric phase transition. All the crystals examined had, at the transition, thermal anomalies in the spontaneous quadrupole moment measured in the absence of external mechanical stresses and in the quadrupole 'compliance', proportional to the ratio of the change in the quadrupole moment and the mechanical stress causing this change. It is shown that the nonlinear dependences of the quadrupole moment on the external stress, which are typical of incommensurate phases in ferroelectrics, exist only in the polar phases of group IV crystals. (12 refs.)

62903 Possible ferroelectric orientational phase transition induced by an electromagnetic field. V.I.Emel'yanov, Z.Zokhdi (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys-Tech. Phys. (USA), vol.27, no.9, p.1156-9 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1883-7 (Sept. 1982). [received: April 1983]

It is of interest to study the possibility of inducing orientational ferroelectric phase transitions with a light wave (the transitions would involve aligning the dipoles in a single direction). For such transitions to occur, it is necessary that there be positive feedback: The static field which arises as a result of the spontaneous ordering should induce additional ordering. The authors investigate two possible mechanisms for photoinduced feedback in systems having a dipole-dipole interaction. The dipole-dipole interaction, which reflects the cooperative character of the system, is taken into account phenomenologically by introducing an effective Lorentz field. The first (quasiresonance) mechanism is due to the fact that the frequency of an infrared molecular transition in quasiresonance with the frequency of the light wave is shifted when a static field arises in the medium (electrochromism). The more effective mechanism, however, is that due to the change in the dipole moment of an electronic transition of the molecules in the static field. (6 refs.)

77.90 OTHER TOPICS IN DIELECTRIC PROPERTIES AND MATERIALS

62905 Dielectric friction on a moving ion. B.U.Felderhof (Inst. fur Theoretische Phys. A, RWTH, Aachen, Aachen, Germany).

Mol. Phys. (GB), vol.48, no.5, p.1003-18 (10 April 1983). The author considers the continuum model for dielectric friction on an ion moving in a fluid. The ion may have non-zero polarizability and the frequency dependent dielectric constant of the fluid may involve more than one relaxation time. The frequency dependent friction coefficient is calculated to second order in the change of the ion. The author shows that the Hubbard-Onsager theory of ionic mobility needs to be corrected. 62906 Light-induced degradation of semiconductor surfaces as studied by photoacoustic spectroscopy: photodarkening process of Zn_{0.5}Cd_{0.5}Ag_{0.5}Al_{0.5} phosphors. Y.Ohba, M.Mizuta, H.Kukimoto (Imaging Sci. & Engng. Lab., Tokyo Inst. of Technol., Yokohama, Japan).

Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L182-4 (March 1983). A photoacoustic technique has been applied for studying light-induced darkening of Zn_{0.5}Cd_{0.5}Ag_{0.5}Al_{0.5} phosphors in various gas ambients. The threshold energy and the rate for the light-induced darkening depend on the bandgap energy of the materials. The darkening process occurs effectively in the mixed ambient gases of N₂, CO₂ and H₂O which are the components of air. A bleaching process has also been observed in a mixture of O₂ and H₂O.

62907 To some phenomenological aspects of the optical dispersion in solids. P.Bussemer, U.Dietrich, B.Wilhelmi (Sektion Phys., Friedrich-Schiller Univ., Jena, Germany).

Exp. Tech. Phys. (Germany), vol.31, no.1, p.21-31 (1983). In German. The behaviour of the dispersion $n(\omega)$ for crystalline and amorphous materials is described by the one-oscillator model due to Wemple (1971). The predictions of this model for the $n-\nu$ diagram (ν -Abbe value) and the $\vartheta-\nu$ diagram (ϑ -relative partial dispersion) are proved. For a more exact discussion it is necessary to add a second oscillator, the location of which is correlated with that of the first oscillator. (11 refs.)

62908 Structure of reflection bands of Grandjean textures. A.Saape (Liquid Crystal Inst., Kent State Univ., Kent, OH, USA), G.Meier. *Phys. Rev. A (USA)*, vol.27, no.4, p.2196-200 (April 1983).

The characteristic exponents of the normal modes for light in the Grandjean texture of a cholesteric film were calculated with values for the dielectric constants that are typical for common cholesteric derivatives. The reflection properties are discussed in terms of the penetration depth given by the real part of the characteristic exponent. The results are presented in graphs which give the structure and the reflection coefficients as a function of wavelength and angle of incidence. It was found that there are unpolarized bands that are missing in a stability chart published earlier. (8 refs.)

62909 Photochromism and its origin of heat-treated Na₂O-BaO-Al₂O₃-TiO₂ glasses. T.Kokubo, T.Hirata (Inst. for Chem. Res., Kyoto Univ., Uji, Japan).

Yogyo-Kyokai-Shi (Japan), vol.90, no.1048, p.698-703 (1982). Glasses with various compositions in the systems (mNa₂O₅+mBaO)-AlO_{1.5}-SiO₂, where n/m is 1/0, 2/1, 1/1, 1/2 or 0/1, were heated to various temperatures from 650°C to 950°C at a rate of 5°C/min in a SiC furnace, and then cooled outside the furnace. All the glasses examined darkened on 60 min-irradiation of 365 nm light of 6 W ultraviolet lamp, after heating to certain temperatures depending on their compositions. On the surfaces of all the heat-treated specimens showing photochromism, an unknown crystalline phase, X, was detected. All the specimens containing the X phase, however, did not always show the photochromism. Consequently, the cause of the photochromism of the heat-treated glasses described above was attributed to defects, probably induced by impurities, in the X phase precipitated on the surfaces of the glasses. The X phase was observed on the surfaces of both the BaO-free glasses and Na₂O-free glasses. The fluorescence X-ray analysis of powders of a Na₂O₅-BaO-AlO_{1.5}-TiO₂ glass which had been heated to 700°C and immersed in a 2N NaOH solution at 95°C for 100 h showed that the X phase is deficient in Al and rich in Ti. - 62910** Diffusion of optical excitation at finite temperatures. D.L. Huber (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA). *J. Chem. Phys. (USA)*, vol.78, no.5, p.2530-2 (1 March 1983). The author studies diffusion of optical excitation as a function of the ratio of the temperature to the inhomogeneous linewidth Δ . When $T \ll \Delta$ the diffusion constant associated with one-phonon-assisted dipolar transfer over a Gaussian line is suppressed by the factor $\exp(-\Delta^2/T^2)$. The effect is attributed to a decrease in the effective density of ions participating in the transfer. (9 refs.)

78.20D Optical constants and parameters

- 62911** Differential refractive indices of star-shaped and linear polystyrenes. Siao Fang Sun, D.Chao, S.Lin (Dept. of Chem., St. John's Univ., Jamaica, NY, USA). *Polym. Commun. (GB)*, vol.24, no.3, p.84-6 (March 1983). The differential refractive indices of star-shaped and linear polystyrenes have been studied in good solvents (benzene, dioxane) and poor solvents (cyclohexane, 71.4% dioxane-28.6% methanol, v/v) over the temperature range 25°-55°C. It was found that the change in differential refractive index with temperature gives a straight line in all the solvents for the linear polystyrene, but not for the star-shaped polystyrene. From the original data of the differential refractive index as a function of temperature, two parameters were evaluated for each polymeric system: the temperature coefficient and the activation energy. The results suggest that there is a difference in the polarizability of the two polymers under the same conditions. The polarizability of the linear polystyrene is constraint free, while that of the star-shaped polystyrene is constrained. (12 refs.)
- 62912** Optical activity of β,γ -enones: a quantitative chirality rule. P.H. Schippers, H.P.J.M. Dekkers (Dept. of Theoretical Organic Chem., Univ. of Leiden, Leiden, Netherlands). *J. Am. Chem. Soc. (USA)*, vol.105, no.1, p.79-84 (12 Jan. 1983). Generally the relation between molecular geometry and circular dichroism (CD) of an electronic transition is made via the rotational strength R , which contains the scalar product of the magnetic ($\vec{\mu}$) and electric (\vec{R}) dipole moment in that transition. It is assumed that with β,γ -enones the optical properties of the $n \rightarrow \pi^*$ transition derive from a perturbation of the local $n_{CO} \rightarrow \pi^*_{CO}$ transition in the carbonyl chromophore by the remaining part of the molecule. Since the $n_{CO} \rightarrow \pi^*_{CO}$ transition is strongly magnetic dipole allowed (along the C=O bond, z direction) but electric dipole forbidden, the rotational strength in β,γ -enones probes the z component of the admixed extraneous transition moment R , whose magnitude is measured by the square root of the dipole strength D . It appears advantageous to express the optical activity as $R/(\vec{\mu} \cdot D)^{1/2} = \cos \theta$ since then it no longer contains the magnitude of \vec{r} and is a direct measure of the angle θ between the C=O bond and the direction of the admixed electric dipole transition moment. For a series of rigid β,γ -enones, a surprisingly high correlation is found between $\cos \theta$ and the cosine of the angle ξ between the C=O bond and the $C_{\alpha} = C_{\beta}$ bond: to a good approximation, $n \rightarrow \pi^*$ optical activity and enone structure are quantitatively related by the equation $\cos \theta = -(\text{sign } xy) \cdot (\cos \xi)$, where x and y are the coordinates of the olefine C_{β} atom in the ketone reference frame and xy is positive in the upper-right quadrant. This transport relationship indicates that the unique radiative properties of the $n \rightarrow \pi^*$ state of β,γ -enones derive from a small ethylenic $\pi_{CC} \rightarrow \pi^*_{CC}$ contamination in the carbonyl $n_{CO} \rightarrow \pi^*_{CO}$ state, which might be electrostatically brought in. Within limits, the chirality rule offers a quantitative tool in the study of β,γ -enone stereochemistry, as is illustrated for some examples. (38 refs.)
- 62913** Near-infrared refractive index of bismuth germanium oxide ($\text{Bi}_{12}\text{GeO}_{20}$). E. Burattini (Istituto Nazionale di Fisica Nucleare, Frascati, Italy), G. Cappuccio, M. Grandolfo, P. Vecchia, Sh. M. Efendiev. *J. Opt. Soc. Am. (USA)*, vol.73, no.4, p.495-7 (April 1983). The dispersion of the refractive index of $\text{Bi}_{12}\text{GeO}_{20}$ in the range 1.2-5.0 μm at room temperature has been obtained. Data have been analyzed in terms of Ketteler, Sellmeier-Drude, Lorentz-Lorenz, and Herzberger dispersion formulas. It is found that a Herzberger formula completely describes data on $n(\lambda)$ up to the visible region. (13 refs.)
- 62914** Determination of cubic optical susceptibilities of liquid crystals by coherent four-photon spectroscopy. L.S. Aslanyan, N.N. Badalyan, A.A. Petrosyan, M.A. Khurshudyan, Yu.S. Chilingaryan. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.54-8 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.94-9 (July 1982). [received: April 1983]. The cubic optical susceptibility tensor of the nematic liquid crystal MBBA (*N*-p-methoxy-benzylidene-p-butylaniline) close to the Raman resonance with $\Delta\nu = 1164 \text{ cm}^{-1}$ has been investigated using the method of active Raman spectroscopy. The components of the tensor $\chi_{ijkl}^{(3)}$ were measured first for a homeotropic sample. The composite-sample method employed in the experiment made it possible to measure the absolute value of the resonance and nonresonance constituents of several components of the third-order nonlinear optical susceptibility for MBBA in the nematic phase. Almost a complete set of values was measured for the component of cubic susceptibility, and this is sufficient for determining parameters of the order of S_2 and S_4 . (15 refs.)
- 62915** Ellipsometric investigation of oxidation processes of tin in solid and liquid states. I.A. Shaikievich, P.I. Drozd, L.V. Poprenko, N.V. Sopinskii. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.84-7 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.145-9 (July 1982). [received: April 1983]. Measurements are carried out on the optical constants of tin in the liquid and solid states by the Beattie method with the oxide film formed on the surface taken into account. The growth kinetics of the oxide layer on liquid tin is studied with the use of a mechanical cleaning of the surface during the measurement. Ion bombardment was used for cleaning the oxide layer from the tin surface in the solid state. The thicknesses and refractive index of the oxide layer on the tin surface were calculated within the framework of transition-layer theory. (12 refs.)
- 62916** Determination of volume and surface optical properties of materials by internal-reflection spectra. G.M. Mansurov, N.N. Rozanov, V.M. Zolotarev, S.M. Sutovskii. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.175-8 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.301-6 (Aug. 1982). [received: April 1983]. Within the framework of the frustrated total-internal-reflection (FTIR) effect in the first order of the theory of small perturbations with regard to the

deviation of the permittivity of the specimen from its bulk value, an analytical expression is obtained for the amplitude reflection coefficient of s- and p-polarized light and the general form of the permittivity profile in the surface layer. A method is proposed that permits excluding the effect of the surface layer in determining the optical characteristics of the materials in the volume from the internal-reflection spectra. It is demonstrated in the example of studying the KU-1 glass that by using FTIR spectra the method proposed permits realizing a transition from the averaged effective permittivity values that are observed with the traditional methods of processing the spectra (if the influence of the surface layer is not taken into account) to the actual parameters that characterize the properties of the substance in volume and in the surface layer. (11 refs.)

- 62917** Optical properties of CVD-coated TiN, ZrN and HfN. B. Karlsson, R.P. Shimshock, B.O. Seraphin (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA), J.C. Haygarth. *Sol. Energy Mater. (Netherlands)*, vol.7, no.4, p.401-11 (Jan.-Feb. 1983). The reflectivities of TiN, ZrN and HfN have been measured in the spectral energy range 0.1 to 6.2 eV. The optical constants have been determined by means of a Kramers-Kronig analysis. A separation into interband transitions and free electron behaviour was carried out. The extended free electron region is explained and the interband transitions are compared with allowed transitions in the density of states distribution. The possibility of improving the optical selectivity by shifting E_F is discussed. (28 refs.)
- 62918** Determination of the optical constants and thickness of amorphous V_2O_5 thin films. L. Michailovits, I. Hevesi, Liem Phan, Z. Varga (Inst. of Experimental Phys., Attila Jozsef Univ., Szeged, Hungary). *Thin Solid Films (Switzerland)*, vol.102, no.1, p.71-6 (8 April 1983). Amorphous V_2O_5 films of various thicknesses were prepared on glass substrates by vacuum evaporation. The transmission of the V_2O_5 film/substrate system and that of the substrate were measured in the wavelength range 550-2500 nm. The optical constants and thickness of the films were determined by an improved optical interference method. (9 refs.)
- 62919** Refractive index in epitaxial $\text{Pb}_{1-x}\text{Sn}_x\text{Te}$ films. K.V. Kozhukh, T.A. Kudrykina, I.A. Samoilova, G.A. Fedorus. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.3, p.362-5 (March 1983). In Russian. Transmission spectra of epitaxial $\text{Pb}_{0.83}\text{Sn}_{0.17}\text{Te}$ films of n- and p-type are measured at 100, 300 and 400K within 5-15 μm wave-lengths and carrier concentration ranges of $6 \cdot 10^{19}$ - $9 \cdot 10^{18} \text{ cm}^{-3}$. The following parameters are determined: wave length dependence of the refractive index, high-frequency dielectric constants, effective carrier masses at the Fermi level in specimens with different carrier concentration, longitudinal high-frequency phonon energy $\hbar\omega_{LO} = 16.6 \pm 0.8 \text{ meV}$. A linear decrease is shown for the refractive index linearly with growth in the current carrier concentration. (10 refs.)
- 62920** Quantum chemical modelling of optical properties of simple and oxide clusters. H. Dunker (Sektion Chemie, Friedrich Schuller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.975-86 (1982). In German. The electronic transition energy values and the oscillator strength of small and oxide-clusters are calculated by means of simple quantum chemical approximation-method (HMO). The theoretical values of the refractive index are in a good agreement with experimental data. The refractive index ($\lambda = \text{const}$) of oxide-clusters increases with the degree of aggregation and decreases with the bond strength and the differences of electronegativity of the M-O bond. 62921 Corrections to Maxwell boundary conditions in gyrotropic crystals. E.L.Ivchenko, A.V.Selkin. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.58-63 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.100-8 (July 1982). [received: April 1983]

Within the framework of the theory of additional light waves the limiting transition is performed to the longwave spectral region relative to the exciton resonance. As a result a physical explanation is given of the corrections to the Maxwell boundary conditions within the nonresonance frequency region for crystals with spatial dispersion, in particular for gyrotropic crystals. These corrections are shown to appear after exclusion of strongly damped (supplementary) light waves from the Maxwell boundary conditions by means of supplementary boundary conditions. An analysis is performed of the supplementary boundary conditions within the resonance region of frequencies for gyrotropic crystals from the standpoint of the fulfilment of the energy conservation law and the principle of symmetry of kinetic coefficients. 62922 The degree of order in liquid crystalline side chain polymers [from optical observations]. H.Finkelmann, H.Bentack, G.Rehage (Inst. für Phys. Chem., Tech. Univ. Clausthal, Clausthal-Zellerfeld, Germany). *J. Chim. Phys. & Phys.-Chim. Biol. (France)*, vol.80, no.1, p.163-71 (Jan. 1983).

The order parameter S of liquid crystalline (LC) side chain polymers is compared with the order parameter of corresponding low molar mass LCs by measurements of the birefringence and of the linear dichroism of dye probes. It has been shown that the temperature dependence of S is identical for monomers and for polymers. For the LC polymers, however, the magnitude of S is about 10% smaller than S of the LC monomers. If the mesogenic molecules are linked via different flexible spacers to the backbone no change of S is observed. The nematic and smectic polymers that have been investigated exhibit a glassy state at low temperatures. Below the glass transition S is frozen in and does no longer change with temperature. (31 refs.)

62923 Selective light scattering by disperse birefringent media with an isotropic point. A.Kh.Zilbershtein, L.E.Solovov. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.196-7 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.336-9 (Aug. 1982). [received: April 1983]

Investigates the selective character of light scattering due to the existence of a point of inversion of birefringence. It has been well known for a long time that finely dispersed isotropic bodies immersed in a liquid with a near refractive index demonstrate minimal scattering in that region of the spectrum where intersection of the dispersion curves (IDC) takes place. The well-known Christiansen filters are based on this phenomenon. It has been shown that in solid state two-component systems the Christiansen phenomenon is observed so distinctly that it has been possible to make narrow band optical filters for the IR region with a high transmission coefficient. (12 refs.)

62924 Interference of light in birefringent plates with optical activity and absorption. A.F.Konstantinova, A.I.Okorochnik, E.M.Uyukin (Inst. of Crystallography, Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.27, no.5, p.601-3 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.1002-4 (Sept.-Oct. 1982). [received: April 1983]

The authors discuss the question: do dichroism and optical activity affect the results of measurements of changes in birefringence in optically active absorbent crystals? They consider the problem of determining the intensity of light after passage through the system polarizer-optically active absorbent crystal-analyzer for any arbitrary orientation of the optic axis of the crystal relative to the wave normal of the incident light beam. The problem is solved for the case of normal incidence of light on the plate, without taking account of multiple reflections or of the phase change at the boundary of the absorbent crystal. (12 refs.)

62925 Induced gyrotropy, birefringence, and dichroism in semiconductors excited by picosecond light pulses. A.A.Polyakov, V.N.Trukhin, I.D.Yaroshetskii. *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.8, p.439-40 (Aug. 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.1018-21 (Aug. 1982). [received: April 1983]

Reports the picosecond observation of optically induced gyrotropy, birefringence, and dichroism in semiconductors, specifically, silicon and gallium arsenide. To study these effects the authors used a picosecond test beam method, which consists of studying the change caused in the polarization of a test beam by the intense pump light pulse. The light source is a YAG:Nd³⁺ laser in mode-locked operation producing a train of picosecond pulses. (7 refs.)

62926 Elastooptic properties of InP. N.Suzuki, K.Tada (Dept. of Electronic Engng., Univ. of Tokyo, Tokyo, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.3, p.441-5 (March 1983). All of the elastooptic coefficients p_{11} , p_{12} and p_{44} in InP have been measured in the wavelength region from 1.06 μm to 1.50 μm at room temperature. The measurement has been carried out by the Dixon-Cohen method, but correction of acoustic wave diffraction, which causes large error in a measurement especially under the Raman-Nath diffraction condition, is made using a simple approximation. InP has a large elastooptic figure of merit comparable to that of GaAs. Using the obtained elastooptic coefficients, dispersion of strain-optic coefficients has been derived. The deformation potentials estimated from this analysis are $a \approx -(11 \pm 3)$ eV, $b \approx -(1.5 \pm 1.5)$ eV and $d \approx -(2.8 \pm 1.2)$ eV. (21 refs.)

62927 Piezochroism of swelled polymer solutions. Y.Ogo, Y.Nishino, T.Sato (Dept. of Appl. Chem., Osaka City Univ., Osaka, Japan). *High Temp.-High Pressures (GB)*, vol.14, no.3, p.319-22 (1982). (10th Plansee Seminar on 'Trends in Refractory Metals, Hardmetals, and Special Materials, and their Technology', Reutte, Austria, 1-5 June 1981). Piezochroic shifts (pressure colour changes) were observed for swelled poly(*N*-methyl methacrylamide) in benzonitrile, methyl benzoate, chlorobenzene, benzonitrile-toluene mixture, and α -methylstyrene-toluene mixture. These phenomena are explained on the basis of light scattering by the difference in refractive index of the transparent heterogeneous phases, as in the Christiansen filter effect. (2 refs.)

62928 Rayleigh-Brillouin scattering of transverse and longitudinal acoustic waves in a supercooled viscoelastic liquid. C.H.Wang, Quan-L. Liu (Dept. of Chem., Univ. of Utah, Salt Lake City, UT, USA). *J. Chem. Phys. (USA)*, vol.78, no.7, p.4363-73 (1 April 1983). Rayleigh-Brillouin spectra of 3-phenyl propanol are studied over the temperature range from -119.5° to 98.1°C . The orientation relaxation time is obtained as a function of temperature. The depolarized spectra exhibit clear shear wave sidebands at temperatures below -29.5°C . The polarized spectra give peaks due to the longitudinal acoustic wave whose frequency displays kinks at the glass transition temperature and at 37°C (T_g). T_g is 55°C above the melting temperature (-18°C). The shear wave frequency decreases linearly with increasing temperature. The experimental results on the VH scattering spectra are analyzed according to viscoelastic theories based upon the Voigt and Maxwell models. Comparison of the theory with observed spectra shows that the Voigt model gives a better fit to the experimental data. Microscopic theory has also been developed to derive the Voigt and Maxwell models. Angular dependent studies are proposed to differentiate the various theories which give different predictions about the physical nature of the parameters. (35 refs.)

62929 On the theory of the nonlinear acousto-optical effect in semiconductors. Hoang Ngoc Cam, Nguyen Van Hieu, Ha Vinh Tan (Inst. of Phys., Nat. Center of Sci., Research of Vietnam, Hanoi, Vietnam). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.25-9 (1 March 1983). The modulation of the dielectric susceptibility of direct band gap semiconductors due to the interaction with sound wave is considered up to second order of the deformation tensor. The role of the Coulomb interaction between electrons and the holes, i.e. that of exciton states with discrete and continuous energies, is taken into account. (11 refs.)

62930 Modulation piezoeffectance of cubic polycrystals. L.Bocanek, J.Musilova (Dept. of Solid State Phys., J.E. Purkyne Univ., Brno, Czechoslovakia).

Phys. Status Solidi a (Germany), vol.75, no.2, p.555-8 (16 Feb. 1983). A method for evaluating the hydrostatic component of the piezoeffectance tensor by means of two measurements of the AC piezoeffectance spectra of polycrystalline germanium in polarized light is given. (6 refs.)

62931 Measuring the piezogyration constants of cubic crystals. G.A.Babonas, A.A.Reza (Inst. of Phys. of Semiconductors, Acad. of Sci., Lithuanian SSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.559-61 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.932-5 (Sept.-Oct. 1982). [received: April 1983]

The authors propose a method of investigating the piezogyration effect in nonabsorbing cubic crystals; this represents the change in the components of the gyration tensor under external mechanical stresses, and is determined by an axial tensor of the fourth rank. The authors give the results of an experimental investigation of this effect for crystals of bismuth germanate. (18 refs.)

62932 Dynamics of ultrasound-induced diffraction effects in a nematic liquid crystal oriented with a magnetic field. A.I.Popov, S.V.Pasechnik, V.F.Nozdrev, V.A.Balandin.

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.431-3 (Aug. 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.998-1002 (Aug. 1982). [received: April 1983]

Studies the effect of a longitudinal ultrasonic wave on a homeotropically oriented layer of methoxy benzylidene butylaniline (MBBA) between two transparent plates. The ultrasound wave vector is directed along the Z axis, normal to the unit vector (the director, \hat{n}_0) of the optic axis of the single-domain nematic liquid crystal when unperturbed by the acoustic field. The magnetic induction B is parallel to \hat{n}_0 . Changes in the orientational structure are detected with a light beam propagating normal to the surface of the plates. The sample can be scanned along the Z axis with a change in the thickness h of the liquid-crystal layer over the range 5×10^{-3} to 10^{-3} m. It was found that light diffraction occurs when the MBBA layer is subjected to ultrasound at 4 MHz at an intensity above a certain threshold, which is, for example, $0.37 \times 10^3 \text{ W/m}^2$ at $T = 22^\circ\text{C}$, $h = 5 \times 10^{-4}$ m, and $B = 0$. The intensity and sharpness of the diffraction peaks depend on Z . (5 refs.)

62933 Nonlinear susceptibility of impurity centres in semiconductors. Yu.P.Drozhev (Moscow State Univ., Moscow, USSR).

Phys. Status Solidi b (Germany), vol.116, no.1, p.111-18 (1 March 1983). The nonlinear susceptibility coefficient responsible for the rotation of the light polarization vector in electromodulation experiments, is shown to exhibit a certain structure at a frequency corresponding to the impurity ionization energy. The influence of a strong modulation field and a random field upon the phenomena considered is discussed. (10 refs.)

62934 Permittivity anisotropy of InAs and $\text{Cd}_{0.25}\text{Hg}_{0.75}\text{Te}$ induced by electron drift. Contribution of quantum corrections. L.E.Vorob'ev, V.I.Stafeev, A.Yu.Ushakov, D.A.Firsov (M.I. Kalinin Polytech. Inst., Leningrad, USSR). *Sov. Phys.-Semicond. (USA)*, vol.16, no.10, p.1175-6 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1831-3 (Oct. 1982). [received: April 1983]

An investigation was made of the electric-field dependence of the difference between the refractive indices associated with the electron contribution in the case of light polarized parallel and perpendicular to the field. The investigation was carried out on n -type InAs at $T=80\text{K}$. An analysis of the results obtained for light of the wavelengths $\lambda=10.6$ and $3.39\text{ }\mu\text{m}$ and a comparison with theoretical calculations led to the conclusion that a considerable contribution to the refractive index anisotropy of quantum corrections was made by interband virtual transitions in the case when $\epsilon_0 \approx \hbar\omega$. A similar effect was observed for light of the wavelength $\lambda=10.6\text{ }\mu\text{m}$ at $T=80\text{K}$ or higher in the case of n -type $\text{Cd}_{0.25}\text{Hg}_{0.75}\text{Te}$ in which case the contribution of the quantum corrections was also important. The agreement between the theory and experiment was good. (7 refs.)

62935 Influence of the absorption of light by free carriers on their ambipolar drift. Z.S.Gribnikov (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Phys.-Semicond. (USA)*, vol.16, no.10, p.1183-5 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1843-6 (Oct. 1982). [received: April 1983]

It is shown that a strong density modulation can be expected in the case of ambipolar drift of an electron-hole plasma heated weakly by periodically space-modulated radiation absorbed by free carriers. Calculations are carried out in the approximation of an electron-hole temperature. It is shown that for asymptotically large currents the contrast of a density 'grating' is greater than that of the original radiation 'grating'. For intermediate currents of the ambipolar drift a phase shift appears between the density and radiation gratings and this is necessary for the energy exchange between beams forming a radiation grating. (2 refs.)

62936 Absorption of light by a crystal in the presence of additional high-power laser illumination. V.A.Pazderskii (V.I. Lenin State Univ., Tashkent, USSR).

Sov. Phys.-Semicond. (USA), vol.16, no.10, p.1222-3 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1896-9 (Oct. 1982). [received: April 1983]

The absorption of light by a crystal in the presence of an additional strong electromagnetic field has been investigated on many occasions. A strong electromagnetic field modifies the electron spectrum of a crystal, which gives rise to special features in the frequency dependence of the absorption coefficient of a weak electromagnetic field (wave). Recent experiments on the influence of a strong electromagnetic field on the energy spectrum of carriers have failed to confirm some of the theoretical predictions. The author therefore reviews the problem. (8 refs.)

62937 Electrochromic coloring of vanadium (V) oxide. V.I.Gavriluk, I.M.Chernenko (Russia-Ukraine-Union Tercentennial Anniversary State Univ., Dnepropetrovsk, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1308-9 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2125-6 (Oct. 1982). [received: April 1983]

New information is obtained concerning the physical processes which occur during electrochromism in V_2O_5 by studying colored V_2O_5 single crystals using X-ray diffraction (phase analysis), thermogravimetry, and differential thermal analysis. The decreased mass of colored V_2O_5 for $T=300\text{-}490\text{K}$ and the absorption of heat are due to dehydration of the sample. The irreversible exothermal process which occurs for $T=545\text{-}590\text{K}$ and is the same for oxidizing or neutral atmospheres is characterized by a constant sample mass and cannot be attributed to oxidation or reduction of the sample. This constant-mass exothermal phase is probably due to restructuring (ordering) of the colored region of the crystal. The increase in the mass of colored V_2O_5 for $T>640\text{K}$, which occurs only in an oxidizing environment, may be attributed to oxidation of the sample if it is assumed that the sample was electrochemically reduced during electrochromic coloration. (4 refs.)

62938 Effect of an electric field on the photochromic effect in $\text{Bi}_{12}\text{GeO}_{20}\text{:Mn}$ crystals. Ya.V.Burak, A.S.Sai, I.V.Slonskii.

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.430-1 (Aug. 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.996-8 (Aug. 1982). [received: April 1983]

The influence of the electric field on the photochromic effect does not depend on the polarity of the field or on whether the transparent electrode is in contact with the surface of the sample. These observations imply a purely field mechanism for the effect of the electric field. The photochromic effect in $\text{Bi}_{12}\text{GeO}_{20}\text{:Mn}$ is evidently caused by charge-transfer transitions which change the valence of the manganese ions. Since the $\text{Bi}_{12}\text{GeO}_{20}$ crystal is a good piezoelectric, the application of an electric field causes a polarization and creates stresses in the sample by virtue of the piezoelectric effect. This evidently results in slight changes in the conditions under which the manganese ions responsible for the photochromic effect are found, and the photochromic effect is intensified. (1 ref.)

62939 Electrogyration in cubic alkaline earth nitrates. H.-J.Weber (Inst. fur Kristallographie, Univ. zu Koln, Koln, Germany).

Z. Kristallogr. (Germany), vol.161, no.1-2, p.145-53 (1982). The authors have measured the electrogyration effect in $\text{Sr}(\text{NO}_3)_2$, $\text{Ba}(\text{NO}_3)_2$, and $\text{Pb}(\text{NO}_3)_2$ as a function of temperature and wavelength. Only $\text{Pb}(\text{NO}_3)_2$ displays a slight temperature dependence. The optical transitions responsible for electrogyration are centred between the onset of absorption and the resonance determined by the dispersion of refractive indices. A latent chirality of O^{2-} arrangements as the main source of the effect is suggested. (16 refs.)

78.20L Magneto-optical effects

62940 Magnetopolaritons in ZnTe. W.Maier, G.Schmieder (Max-Planck-Inst. fur Festkörperforschung, Grenoble, France), C.Klingshörn.

Z. Phys. B (Germany), vol.50, no.3, p.193-208 (1983). From an invariant expansion, the authors construct the exciton Hamiltonian for the $\Gamma_6 \times \Gamma_8$ excitons in the T_6 -type material ZnTe represented by an 8×8 matrix including the influences of a finite wave vector and an external magnetic field. They diagonalise the Hamiltonian matrix to obtain the exciton states. Then the excitons are coupled to the electromagnetic radiation field thus giving the polariton states. The theoretical dispersion curves are fitted to the results of two-photon Raman scattering and reflection experiments in magnetic fields up to 22 T. From this fit the authors deduce precise values for the eigenenergies, exciton masses, g -factors, and diamagnetic shifts. (34 refs.)

62941 Absorption line of magnetically anisotropic particles. R.S.Gekht (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.225-9 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. An analysis is made of the profile and intensity of an absorption line of magnetically anisotropic particles subjected to a static magnetic field and this is done for various values of the ratio of the temperature T to the volume V of a particle. It is shown that the range of low values of T/V the line profile is asymmetric and the line width in the strongest field H_0 is independent of the sign of the anisotropy constant K of the particles but is proportional to the ratio $|K|T/H_0 M^2 V$. In the range of weak magnetic fields the line width depends strongly on the sign of K : if $K>0$, it is proportional to T/MV , whereas for $K<0$, it is proportional to $(|K|T/M^2 V)^{1/2}$. (10 refs.) A.T.

62942 Magneto-optical TE-TM mode conversion in $(\text{YNd})_2\text{Fe}_2\text{O}_{12}$ films. T.Okuda, N.Koshizuka, K.Ando (Electrotech. Lab., Ibaraki, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.2, p.933-4 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

$(\text{YNd})_2\text{Fe}_2\text{O}_{12}$ films with in-plane magnetization for magneto-optical use were successfully grown by liquid phase epitaxy. High power conversion ratios ($>80\%$) were found. The growth temperature dependence of the observed film birefringence is larger than that of the birefringence resulting from the stress induced by lattice mismatch. (8 refs.)

62943 Spectroscopic and magneto-optical properties of quasi 1D antiferromagnets AVX_3 ($\text{A}=\text{Cs, Rb}$; $\text{X}=\text{Cl, Br, I}$). A.Häuser, H.U.Gudel (Inst. for Anorganische Chem., Univ. Bern, Bern, Switzerland).

J. Magn. & Magn. Mater. (Netherlands), vol.31-34, pt.3, p.1239-40 (Feb. 1983). (Proceedings of the International Conference on Magnetism, Kyoto, Japan, 6-10 Sept. 1982).

Single crystal absorption and Zeeman experiments on the $^4\text{A}_{2g} \rightarrow ^2\text{T}_{2g}$ transitions in CsVBr_2 show evidence of both 1D and 3D magnetic ordering. (7 refs.)

62944 An investigation of diffraction efficiency of magneto-optic deflection in garnet film. G.Tielian, He Yuchuan (Southwest Inst. of Appl. Magnetics, Mianyang, Sichuan, China).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.161-3 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982). A more precise analytic expression for the diffraction efficiency of the parallel stripe-domain magneto-optic deflection based on the Faraday rotation is derived. The calculated values are compared with the measured data. A new method to enhance the diffraction efficiency is presented. The experiment shows that the efficiency is increased by about 35 times. (7 refs.)

62945 Magneto-optical spectra of RF-sputtered amorphous Gd-Co and Gd-Fe films. K.Sato, Y.Togami (Broadcasting Sci. Res. Labs. of Nippon Hoso Kyokai, Tokyo, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.181-2 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

Spectra of polar magneto-optical effects of Gd-Co and Gd-Fe have been studied; Kerr rotation increases gradually from the visible to the near IR region with a hump around 1 eV and Kerr ellipticity changes sign at a certain photon energy, which depends on sputtering conditions. (9 refs.)

62946 Magneto-optical effect spectra of rare-earth-transition-metal amorphous films. D.F.Shen, T.Numata, Y.Sakurai (Faculty of Engng. Sci., Osaka Univ., Osaka, Japan), K.Sato.

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.202-4 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

Some results of the magneto-optical effect spectra of rare-earth-transition-metal amorphous films are presented. These results suggest that the polarity reversal of the Kerr hysteresis loops on the surface of the films after annealing with limited oxidation is sometimes not due to the magnetic origin but may be mainly due to the change of the optical properties of the oxide surface layer. (5 refs.)

62947 Maximum amplification of the polar Kerr effect by surface coatings. V.S.Merkulov.

Opt. & Spectrosc. (USA), vol.53, no.1, p.82-4 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.141-4 (July 1982). [received: April 1983]

An expression is obtained for the maximum amplification by surface coatings of the coefficient $|r_p|$ in the polar Kerr effect in the case of normal incidence. (5 refs.)

62948 Polarization of electromagnetic waves in absorbing magnetically ordered media of middle and higher categories. S.S.Girgel.

Opt. & Spectrosc. (USA), vol.53, no.2, p.213-14 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.361-4 (Aug. 1982). [received: April 1983]

Absorbing media of middle and higher categories having magnetic structure are investigated. The optical properties of such substances in the optical range of frequencies are described by a single complex non-Hermitian tensor of the reciprocal permittivity ϵ^{-1} , assuming $\mu=1$. In magnetically ordered crystals with the spinel or garnet-type structure, with the aid of an external applied magnetic field, one can change the direction of the singular axes within broad limits, which will cause modulation in phase, intensity, and polarization of light transmitted or reflected from the platelet. For all magnetic crystals of the cubic system, which are compensated antiferromagnetics, and also in the five magnetic classes of textures ocoom , ocoom' , cocoml' , ocoo , ocool' , the permittivity ϵ is a scalar quantity, and birefringence is absent; therefore, with respect to optical properties they behave like isotropic media. (7 refs.)

62949 Nonlinear magneto-optical phenomena of the third harmonic in semiconductors. H.Stramska (Inst. of Phys., Warsaw Univ., Warsaw, Poland).

Phys. Status Solidi b (Germany), vol.116, no.1, p.129-35 (1 March 1983).

The calculations are carried out starting from the Boltzmann equation. The Faraday rotation and ellipticity of the third harmonic in the current density, are associated with the energy dependence of the momentum relaxation time for a parabolic band and with the nonparabolicity of the band for a constant relaxation time. The present results predict a large enhancement due to resonance at high magnetic fields. It is shown that the magneto-optical effects have an oscillatory region. (9 refs.)

62950 The influence of crystal symmetry on magnetooptical effects in orthoferrites. J.Fink-Finowicki (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).

Physica B & C (Netherlands), vol.115 B+C, no.2, p.225-8 (Jan. 1983).

The relation between magnetic structure and magnetooptical properties of orthoferrites is calculated. By means of a comparison with experimental data it is demonstrated that the triclinic distortion of Fe-O₆ complexes in these materials plays a crucial role in the origin of anomalously strong magnetooptical effects and also in the origin of the anisotropy of these effects. (12 refs.)

62951 Photoinduced spectral change in the rotation of the plane of polarization of light in FeBO₃. A.A.Leksikov, Yu.M.Fedorov (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.405-6 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.934-7 (Aug. 1982). [received: April 1983]

Iron borate exhibits a photomemory and the properties of an optically controllable filter. Recording and readout can be carried out with light beams differing in both intensity and wavelength. The modulating effects are the linear magnetic dichroism and the Cotton-Mouton effect, so that the readout can be performed through a modulation of the beam by the medium in terms of three parameters: the intensity, the azimuthal position of the plane of polarization, and the phase shift. The modulation depth can be controlled by both the direction of the magnetic field at the time of the recording and the duration of the recording light pulse. (7 refs.)

62952 The influence of the parallel magnetic field on the interband optical absorption in thin films. M.Zaluzny (Inst. of Phys., M. Curie-Sklodowska Univ., Lublin, Poland).

Thin Solid Films (Switzerland), vol.102, no.1, p.87-96 (8 April 1983).

The effect of a parallel magnetic field on the interband optical absorption in size-quantized semiconductor layers is discussed on the basis of the effective mass approximation. The case of the simple and degenerate (germanium-like) valence band is considered. (12 refs.)

62953 Thermorefectance study of polydiacetylene-bis (toluene sulphonate) single crystal (PDA-TS). S.Stizza, I.Davoli, V.Prantera (Inst. di Fisica, Univ. di Camerino, Camerino, Italy), A.Bianconi, J.Glinski, J.Kalinowski.

J. Phys. C (GB), vol.16, no.11, p.2165-76 (20 April 1983). For the first time studies have been made of the polarised thermorefectance of an oriented PDA-TS single crystal. The spectra in the photon energy range 1.9-2.5 eV are taken at room and liquid nitrogen temperature. From the different sensitivities to temperature the structures at 2.00 eV and 2.44 eV are assigned to excitonic and interband transitions, respectively. The binding energies of the excitons at room temperature (0.44 eV) and those corresponding to the low-temperature split band gap have been estimated to be nearly identical: 0.43 eV and 0.44 eV. The main thermorefectance structures are assigned to a Frenkel exciton interacting with phonons. (35 refs.)

78.30 INFRARED AND RAMAN SPECTRA AND SCATTERING

62954 Vibrational spectroscopy of solid state molecular dimers. T.J.Kosic, C.L.Schösser, D.D.Dlott (Dept. of Chem., Univ. of Illinois, Urbana, IL, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.57-64 (25 March 1983).

The IR and Raman spectra of α - and β -perylene crystal vibrations are investigated. β -perylene is monomeric and α -perylene has face-to-face dimers. Frequencies and forms of the lattice vibrations as well as vibron relaxation and localization are discussed. Polarization ratios in α crystals are perturbed by coupling to dimer vibrations. (16 refs.)

62955 Raman scattering from Pt(CN)₄²⁻ adsorbed on Pt colloids. R.E.Benner (Appl. Phys. Div., Sandia Nat. Labs., Livermore, CA, USA), K.U.von Raben, K.C.Lee, J.F.Owen, R.K.Chang, B.L.Laube.

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.65-9 (25 March 1983). Raman scattering from Pt(CN)₄²⁻ adsorbed on Pt colloids (average diameter of 16 Å) is compared with the Raman signal from the same amount of Pt(CN)₄²⁻ in solution. The wavelength dependence of the adsorbate Raman intensity is measured from 308 to 647 nm and compared with a Lorenz/Mie calculation of the enhancement factor for the electromagnetic field intensity on the surface of a Pt sphere as a function of sphere radius and incident wavelength. (24 refs.)

62956 Functional groups in carbon black by FTIR spectroscopy. J.M.O'Reilly, R.A.Mosher (Webster Res. Centre, Joseph C. Wilson Centre for Technol., Rochester, NY, USA).

Carbon (GB), vol.21, no.1, p.47-51 (1983). Results of the application of Fourier transform infrared (FTIR) spectroscopy to determine the type and amount of surface functional groups in carbon black are reported. Surface functional groups in carbon black have been identified and analysed using carbon black dispersions in KBr. At low dilutions, less than 0.10% (wt/wt), Beer's law is followed. Absorbance at 1720 cm⁻¹ can be assigned to carboxylic acid, while the assignment of the strong band at 1600 cm⁻¹ is uncertain. Semi-quantitative analysis of band shapes indicates that there is a distribution of electronic environments in the carbon blacks. The magnitude of the absorbances (0.02-0.10) correspond to carboxylic or quinone groups in the amount of ~0.1-1.8 meq/g. Further developments of the technique could lead to a quantitative method for the determination of functional groups in carbon black. (11 refs.)

62957 Infrared spectrum of thawed water. B.V.Zhadanov, I.A.Polyakova (All-Union Sci. Res. Inst. of Chem. Reagents & Ultrapure Substances, Moscow, USSR).

Colloid J. USSR (USA), vol.44, no.3, p.560-1 (May-June 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.3, p.618-19 (May-June 1982). [received: Feb. 1983]

The infrared spectra of thin films (10 μm) of thawed water and of redistilled water have been obtained. No significant differences between the spectra were obtained in the region 1100-3100 cm⁻¹. It is concluded therefore that the differential spectrum of thawed water against redistilled water could not have been obtained experimentally, in view of the fact that too great a thickness of the fluorite cells ($l=2$ cm, about 10000 times greater than the admissible) has been chosen. (4 refs.)

62958 Raman scattering studies on slow crystallization process from amorphous PbTiO₃. M.Takashige, T.Nakamura, Y.Aikawa (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

Ferroelectr. Lett. Sect. (GB), vol.44, no.11, p.313-18 (1983). The effect of isothermal annealing of amorphous PbTiO₃ below the crystallization temperature, T_{cryst} , has been investigated by Raman scattering measurements. The occurrence of the crystallization has been confirmed by the appearance of the soft mode. In the crystallized sample, the possibility of the occurrence of a crystalline phase, which is different from the tetragonal PbTiO₃ of perovskite structure, has been pointed out. (4 refs.)

62959 Theory of surface enhanced Raman scattering. K.A.Arunkumar, E.B.Bradley (Dept. of Electrical Engng., Univ. of Kentucky, Lexington, KY, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.2882-8 (15 March 1983).

It is now generally accepted that more than one mechanism could be at work in enhancing the Raman signal from molecules adsorbed onto a rough surface. In this paper the authors present a simple surface coverage, surface roughness dependent model that accounts for one such mechanism. According to the model, each adsorbate is subjected to both polarizing and depolarizing fields from its oscillating neighbors. Competition between these two fields is shown to determine the magnitude of signal enhancement. (62 refs.)

62960 Effect of pressure on Raman spectra of solid bromine. P.-G.Johannsen, W.B.Holzappel (Experimentalphys., Univ. GH Paderborn, Paderborn, Germany).

J. Phys. C (GB), vol.16, no.10, p.1961-5 (10 April 1983).

The effect of pressure on Raman spectra of solid bromine has been measured up to 33 GPa using a diamond anvil cell. Four of six Raman-active modes could be observed in first-order Stokes and anti-Stokes spectra at room temperature. Overlap of the two intramolecular peaks takes place at 24 GPa. The relative scattering intensities of the two intermolecular modes vary with pressure, exceeding finally those of the intramolecular modes. (8 refs.)

62961 Some oxygen donor complexes of cyclopentadienylneptunium(IV) trichloride. K.W.Bagnall, M.J.Plews (Chem. Dept., Univ. of Manchester, Manchester, England), D.Brown.

J. Less-Common Met. (Switzerland), vol.90, no.1, p.29-35 (March 1983).

The oxygen donor complexes [NpCl₄(dmpva)₂](dmpva≡Me₂CCONMe₂), [Np(cp)Cl₃L₂](cp≡ η^5 -C₅H₅; L₂=tetrahydrofuran (thf), MeCONMe₂ (dma), dmpva, Ph₃PO (tppo), (Me₂N)₂PO (hmpa), 1/2(Ph₂P(O)CH₂CH₂P(O)Ph₂)(1/2dppoe) and [Np(η^5 -C₅Me₄Et)Cl₃(tppo)₂] were prepared. The cyclopentadienyl complexes with dma, dmpva and tppo, but not that with hmpa, disproportionate to a mixture of [Np(cp)Cl] and [NpCl₄L₂] when recrystallization from thf is attempted. IR and near-IR-visible absorption (solution) spectra are reported for these compounds. (15 refs.)

62962 Raman and luminescence studies of alkali borate tungstate glasses. D.Deal, M.Burd, R.Braunstein (Univ. of California, Los Angeles, CA, USA).

J. Non-Cryst. Solids (Netherlands), vol.54, no.3, p.207-21 (March 1983). Raman and luminescence spectroscopy were used to determine the structure of alkali borate tungstate glasses: M₂O(B₂O₃)₂xWO₃, M=Li or Na(0<x<1). Raman scattering results showed the dominant tungstate species in these photochromic glasses to be tetrahedral WO₄²⁻. At high concentrations of WO₃, WO₃H₂O, and W₂O₇ are also present. Luminescent measurements provided evidence for an octahedral WO₃ structure not identified by the Raman results. The results also revealed a possible change in the structure of the glasses similar to that observed in alkali borate glasses and associated with the 'borate anomaly'. In addition, preliminary measurements

are reported on the variation of the band gap, density, index of refraction, and the elastic coefficient C_{11} determined by Brillouin scattering with composition. (23 refs.)

62963 Structural interpretations for some Raman lines from vitreous silica. A.G.Revesz (COMSAT Lab., Clarksburg, MD, USA), G.E.Walrafen. *J. Non-Cryst. Solids (Netherlands)*, vol.54, no.3, p.323-33 (March 1983).

An interpretation based on non-random structural features is advanced for the 490 and 604 cm^{-1} Raman lines from vitreous silica. The sharp, polarized 490 cm^{-1} line is considered to arise from a small concentration of planar rings involving three $\text{SiO}_4/2$ tetrahedra. The somewhat broader line at 604 cm^{-1} is thought to be associated with rings of various sizes, both planar and puckered, that are connected to the rest of the structure by elongated Si-O bonds. Changes in the concentration and/or Raman scattering cross-section of these ring structures produced by changes in fictive temperature, neutron irradiation, high elastic tensile and compressive stresses, annealing, and by changes in the Si-OH content are thought to produce the intensity variations observed in these two Raman lines. (31 refs.)

62964 Semiconducting properties of silver thiocyanate. K.Tennakone (Dept. of Phys., Ruhuna Univ. Coll., Matara, Sri Lanka), R.H.Wijayanayake. *J. Phys. D (GB)*, vol.16, no.4, p.L79-80 (14 April 1983).

The authors report measurements of the band gap of AgCNS by the study of optical absorption. It is concluded that silver thiocyanate is a p-type semiconductor with band gap ≈ 3.4 eV. (12 refs.)

62965 The reflection-absorption infrared spectrum of the dioxygen species adsorbed on platinum recorded by FT-IR spectroscopy. N.D.S.Canning, M.A.Chesters (School of Chem. Sci., Univ. of East Anglia, Norwich, England).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.69-76 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The reflection-absorption infrared spectrum of oxygen adsorbed on a recrystallized Pt foil at 80K shows a single band at 875 cm^{-1} at saturation coverage. The spectrum produced by an equilibrated mixture of oxygen isotopes confirms that the adsorbate is molecular. The apparent effective charge, e^* , calculated from the RAIR spectrum is in good agreement with that calculated from the electron energy loss (EEL) spectrum reported previously. The coverage dependent frequency shift can be accounted for by dipole-dipole coupling. The large inherent bandwidth is probably due to enhanced vibrational relaxation via electron-hole pair formation. (17 refs.)

62966 Infrared emission spectroscopy of CO on Ni. S.Chiang, R.G.Tobin, P.L.Richards (Dept. of Phys., Univ. of California, Berkeley, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.113-18 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The authors report the first observation of thermally emitted infrared radiation from vibrational modes of molecules adsorbed on clean, single crystal metal surfaces. The observation of emission from CO adsorbed on Ni demonstrates the surface sensitivity of a novel apparatus for infrared vibrational spectroscopy, with a resolution of 1 to 15 cm^{-1} over the frequency range from 330 to 3000 cm^{-1} . A liquid helium cooled grating spectrometer measures the thermal radiation from a room temperature, single crystal sample, which is mounted in an ultrahigh vacuum system. Measurements of frequencies and linewidths of CO on a single crystal Ni sample, as a function of coverage, are discussed. (12 refs.)

62967 On the contribution of charge transfer excitations to SERS.

A.Otto (Phys. Inst. III, Univ. Dusseldorf, Dusseldorf, Germany).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.329-42 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Resonant Raman scattering due to dynamical charge transfer from the silver metal to the lowest unoccupied orbital of pyridine and other adsorbates contributes 1 to 2 orders of magnitude to SERS. Several experimental observations indicate, that this mechanism is particularly effective at sites of atomic scale roughness. (60 refs.)

62968 Multichannel Raman spectroscopy of unroughened noble metal and nonnoble metal films and tunnel junctions. J.C.Tsang, Ph.Avoris, J.R.Kirtley (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.343-8 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The authors demonstrate that multichannel optical detectors provide the capability of observing Raman scattering from molecular monolayers in solid-air and solid-solid interfaces in the absence of the conditions considered essential for surface enhanced Raman scattering. They present spectra of adsorbates on smooth Ag films, air-oxidized smooth Al films and Al gratings. Finally, they demonstrate a new configuration for surface enhanced Raman scattering which need not involve noble metals. Raman scattering from a doped $\text{Al}/\text{AlOx}/\text{Sn}$ tunnel junction provides a specific example of such a configuration. (12 refs.)

62969 Orientation dependence of surface enhanced Raman intensities: results from ab initio calculations. P.K.K.Pandey, G.C.Schatz (Dept. of Chem., Northwestern Univ., Evanston, IL, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.351-5 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Time dependent Hartree-Fock methods have been used to calculate Raman intensities for H_2 adsorbed onto a model lithium cluster as a function of the orientation of H_2 relative to the cluster surface. The intensity is found to be largest for perpendicular adsorption, dropping to a small value at an intermediate angle, and then rising to a second but smaller maximum for parallel adsorption. The results are interpreted using a model which correlates enhancement to lithium cluster orbital energy shifts induced by the static quadrupole field of H_2 . (9 refs.)

62970 Surface enhanced Raman scattering (SERS) from silver, copper, and gold films in UHV: excitation spectra. I.Pockrand (Phys. Inst. III, Univ. Dusseldorf, Dusseldorf, Germany).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.357-62 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

SER excitation spectra of different vibrational lines of various molecules ($\text{C}_2\text{H}_2\text{N}$, C_2H_4 , O_2 , CO) adsorbed on Ag-, Cu-, and Au-films in UHV have been studied. The experimental results are explained by assuming an electromagnetic origin of the observed excitation profile resonances. Within this frame the authors estimate a size of ~ 1.2 nm of the 'SERS relevant' surface roughness (bumps) and consequently a short range 'classical' enhancement restricted to mainly the first layer of adsorbed molecules. (20 refs.)

62971 A comparison of Raman scattering, resonance Raman scattering, and fluorescence from molecules adsorbed on silver island films. D.A.Weitz (Exxon Res. & Engng. Co., Linden, NJ, USA), S.Garoff, J.I.Gersten, A.Nitzan.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.363-70 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The enhancement of Raman scattering (RS), resonance Raman scattering (RRS), and fluorescence from molecules adsorbed on silver-island films is reported. A hierarchy of enhancements is found: 10^3 for RS, 10^3 for RRS, and 0.1-10 for fluorescence, depending on the quantum yield of the free molecule. Using the framework of the electromagnetic theory of surface-enhanced Raman scattering, generalized to treat molecular resonance phenomena, the authors develop a unified picture of the role of the surface plasmon resonances, and the surface-induced damping, in the light scattering processes. The observed hierarchy of enhancements is shown to have important spectroscopic consequences. (11 refs.)

62972 Influence of foreign metal atoms deposited at electrodes on local and nonlocal processes in surface enhanced Raman scattering. B.Pettinger, L.Moeri (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.383-95 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Surface enhanced Raman scattering (SERS) from electrodes exhibits a reversible potential dependence in a limited potential range. Cathodic of this range it is irreversibly quenched on Ag electrodes by more than one order of magnitude. This holds for adsorbed pyridine molecules, for chloride, bromide, iodide, cyanide or thiocyanate ions, and for water or deuterium oxide. Since the (sub)microscope roughness is not altered by this procedure, the quenching has to be explained by a vanishing of SERS active sites, an idea which is clearly confirmed in metal deposition experiments using SERS for pyridine as a probe. In some cases, the deposition of a fraction of a monolayer (θ ca. 0.01) of a foreign metal on Ag is sufficient to significantly modify the intensity, the Raman shift and the halfwidth of the SERS bands. For example, the almost total quenching of SERS on Ag electrodes at cathodic potentials of -1.7 V is prevented to a great extent by Cu coverages of $\theta=0.003$. This evidences a low density of active sites. In other cases the impurity metal affect mainly on the SERS intensity, obviously by damping the electromagnetic resonances. These effects clearly reveal the importance and cooperation of local and nonlocal enhancement processes. (30 refs.)

62973 Surface Raman spectroscopy without enhancement: pyridine on Ag (111). A.Campion (Dept. of Chem., Univ. of Texas, Austin, TX, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.397-400 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The author has observed normal Raman scattering from a monolayer of pyridine adsorbed on a Ag (111) surface at 110K. Unlike many previous studies of this system, he finds no appreciable enhancement of the scattering cross section. The results suggest that the short range enhancements observed on other well-characterized silver surfaces may be due to chemisorption on sites that are not available on the (111) surface. (9 refs.)

62974 Raman spectra of pyridine adsorbed on Ni (111). Chih-Cong Chou, C.E.Red, J.C.Hemminger, S.Ushioda (School of Phys. Sci., Univ. of California, Irvine, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.401-6 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The authors have measured the intensities of the 992 cm^{-1} (ν_1) and 1032 cm^{-1} (ν_2) lines in the Raman spectra of pyridine multilayers adsorbed on a Ni (111) surface, as a function of multilayer thickness. These experiments have been carried out in a standard ultra high vacuum chamber with Auger electron spectroscopy and mass spectroscopy capabilities. They find that the intensity of the 992 cm^{-1} line decreases linearly with multilayer thickness down to ~ 5 layers. From these data and spectra of submonolayer quantities of nitrobenzene on Ni (111) they predict an observable intensity for unenhanced spectra for monolayer amounts of pyridine on Ni (111). Attempts at observation of monolayer pyridine on this surface have been unsuccessful. The authors conclude that the scattering intensity of chemisorbed pyridine on Ni (111) is not enhanced and is less likely than would be predicted from the gas phase cross section. (8 refs.)

62975 Surface enhanced Raman spectroscopy of palladium. B.H.Loo (Materials Res. Lab., SRI Internat., Menlo Park, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.407 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given as follows. Large enhancements in the Raman scattering signals have been observed from molecules and ions adsorbed on a palladium surface. The largest enhancement factor is in the order of 10^3 . Results will be discussed in terms of theoretical models on the surface enhanced Raman scattering process. (no refs.)

62976 The SERS phenomenon in light of recent excitation profile measurements. H.Seki (IBM Res. Lab., San Jose, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.413-20 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The author has recently reported on the measurements of the ultra high vacuum (UHV) surface enhanced Raman scattering (SERS) excitation profile for pyridine and CO on two different kinds of silver surfaces prepared in situ. The curves all show a maximum and the peak position depend both on the adsorbed molecule and the preparation of the silver surface. The optical spectra of these systems have also been measured using an oscillating beam spectrometer which compares the difference in the reflected light at two adjacent areas with and without the adsorbed molecules. The SERS phenomenon investigated in UHV is viewed in light of these results. (48 refs.)

62977 Exact calculations of scattering and enhanced fields of electromagnetic waves on grating surfaces. N.Garcia (Dept. de Fisica Fundamental, Univ. Autonoma de Madrid, Madrid, Spain).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.421-5 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Presents scattered intensities and values of the electromagnetic field for p-polarized light on Ag grating surfaces using the theory of Toigo, Marvin, Celli and Hill (1977). The theory is based on the application of the extinction theorem to Green's theorem. The program for calculations is set for any shape of the grating profile. Calculations are performed when the incident light is in resonance with the surface plasmon polariton. The shape of the scattered intensities are calculated for different grating amplitudes and it is shown that, for example, the reflectivity can present a minimum or a maximum depending on the amplitude and shape of the grating. It is shown that

the enhanced field (the ratio between the modulus squared of the scattered field to the modulus squared of the incident field)(e) has a maximum when the reflectivity is a minimum as a function of the incident angle. The maximum of e is larger when the minimum in the reflectivity is smaller as a function of the grating amplitude. The value of e is calculated in a fine grid near to the grating and the values of the maxima are of the order of 250, then if the Raman cross-section is proportional to the fourth power of the field this could produce 10^4 to 10^5 in the cross-section and explain SERS. The width of the resonances as well as the plasmon dispersion relation will be also presented. (18 refs.)

62978 Infrared spectroscopy of adsorbates on low-area surfaces; the advantages of a photons-in photons-out technique. J.Overend (Dept. of Chem., Univ. of Minnesota, Minneapolis, MN, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.1-10 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The technique of double modulation infrared spectroscopy permits the simultaneous measurement of $(I_p - I_s)$ and $(I_p + I_s)$ where I_p and I_s are the intensities of radiation polarized parallel and perpendicular to the plane of incidence at the sample. This particular technique allows the infrared spectrum of a surface adsorbate to be measured in the presence of substantial quantities of bulk-phase adsorbant. The author has used this technique to study the infrared spectra of NO and CO adsorbates on Pt surfaces and of CO adsorbates on a Pt electrode surface in the presence of 1 M H_2SO_4 . The results of these studies shed new light on the origin of the well established wavenumber shifts which are associated with structural changes in the adlayers formed from simple diatomic molecules. (21 refs.)

62979 The application of reflection infrared and surface enhanced Raman spectroscopy to the characterization of chemisorbed organic disulfides on Au. D.L.Allara, R.G.Nuzzo (Bell Labs, Murray Hill, NJ, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.11 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given. The authors have found that a variety of organic molecules containing the S-S linkage strongly adsorb on freshly evaporated or electrochemically cleaned gold surfaces. Adsorption stops at monolayer coverage and the packing density of the molecules can be close to the limit set by the size of the molecules. Reflection infrared spectra show that the films are strongly oriented and in the case of long alkyl-chain-substituted disulfides the films have structures similar to those of Langmuir-Blodgett type films. Most of the films were prepared by freshly evaporating gold onto polished single crystal silicon substrates. Immediately after the deposition the films were removed from the vacuum system (under N_2) and placed in solutions of the disulfides. Infrared spectra were obtained using a Digilab 15B Fourier transform infrared spectrometer with a high f/number optical system and small beam spot size for glancing reflection. Spectra were obtained between 800 and 3200 cm^{-1} using a mercury cadmium telluride detector. (no refs.)

62980 Infrared specular reflection and SERS spectra of molecules adsorbed on smooth surfaces. H.Yamada, N.Tani, Y.Yamamoto (Dept. of Chem., Kwansei Gakuin Univ., Nishinomiya, Japan).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.13-18 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Infrared specular reflection and SERS spectra were measured for chemisorbed species on Ag and Ni at room temperature. Infrared spectra of benzoic acid and p-nitrobenzoic acid showed ionized CO_2 groups on the metals and orientation of molecular axes perpendicular to the surface. Carbon monoxide chemisorbed on Ag appeared at 1940 cm^{-1} (infrared) and at 2112 cm^{-1} (SERS), indicating that the chemisorbed species do not always give SERS. SERS of pyridine adsorbed on TiO_2 and Ti were observed. The resonance Raman scattering via charge transfer excitation is most plausible to explain these SERS phenomena. (12 refs.)

62981 Enhanced adsorbate Raman scattering and surface plasmon radiation. G.L.Easley (Dept. of Phys., General Motors Res. Labs., Warren, MI, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.25 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given, as follows. Presents the first experimental results which demonstrate a quadratic relationship between the enhanced Raman scattering from molecules on Ag surfaces and roughness-coupled surface-plasmon radiation. These results are interpreted by a model which includes both roughness assisted surface-plasmon scattering and radiative coupling. (no refs.)

62982 The adsorption of CO on Pt(111) studied by infrared-reflection-absorption spectroscopy. B.E.Hayden, A.M.Bradshaw (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.51 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given, as follows. The adsorption of CO on Pt(111) between 85K and 300K has been studied by infrared-reflection-absorption spectroscopy together with TPD and LEED. The intensity of the absorption band due to the CO stretch of the linear species shows a maximum at the formation of the $(\sqrt{3}\times\sqrt{3})R30^\circ$ LEED pattern followed by a minimum at the $c(4\times 2)$ structure during the adsorption of CO at low temperatures ($\leq 150K$). The adsorption band due to the C-O stretch of the bridging species appears only after the formation of the $(\sqrt{3}\times\sqrt{3})R30^\circ$ pattern and reaches maximum intensity at the $c(4\times 2)$ structure. Adsorption of CO to higher coverages (corresponding to the compression structures) broadens and shifts this absorption band. At higher temperatures ($\geq 150K$) a third peak is observed at $\sim 40\text{ cm}^{-1}$ below the peak due to the bridging species and is attributed to adsorption in the three-fold sites. At 300K both peaks in this region are very broad. The intensity data differs from that measured with EELS and favors a 'faultline' structure of the type proposed by Avery (1981). Together with the additional information from bandwidths it is possible to distinguish between the various structural models. The results obtained here may also be important in explaining data from other systems such as CO/Cu. (2 refs.)

62983 Infrared spectroscopic investigation of the adsorption of fluoromethane on sodium chloride surfaces under ultra high vacuum. J.Heidberg, I.Hussia, Z.Szilagy (Inst. fur Phys. Chem. und Elektrochem., Univ. Hannover, Hannover, Germany).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.53-8 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The adsorption of CH_3F on NaCl between 77K and 250K was investigated using infrared spectroscopy under ultra high vacuum conditions. All internal normal modes of the adsorbate were observed and assigned. Three adsorption

phases were detected. The largest frequency shift with respect to the gas takes place for the most intense mode, the C-F stretch ν_3 , 102 cm^{-1} (10%) for $\alpha\text{-CH}_3F\text{-NaCl(film)}$ on NaCl(100), while the other modes were much less influenced. No splitting of the vibrations degenerate in the gas occurs. Adsorption isotherms and the isosteric heats of adsorption were determined. (11 refs.)

62984 Infrared spectra of CO adsorbed at low temperatures on Ni. H.J.Levinson, R.G.Tobin, P.L.Richards (Dept. of Phys., Univ. of California, Berkeley, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.65-7 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

At low temperatures (1.5K-40K), CO has been found to chemisorb into terminal, bridge, and three-fold sites on evaporated Ni films. The chemisorption takes place directly, rather than through a precursor state. At least two distinct terminal sites are occupied at high coverages. After the sample is warmed from 1.5K to 40K the infrared spectra change dramatically, showing substantial surface diffusion even at these low temperatures. (7 refs.)

62985 Surface enhanced Raman scattering of water on an Ag electrode. J.F.Owen, T.T.Chen, R.K.Chang (Dept. of Appl. Phys., Yale Univ., New Haven, CN, USA), B.L.Laube.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.189 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given. Surface enhanced Raman scattering of adsorbates on an Ag electrode in various electrolytes (e.g., 0.1-1.0 M KF, KCl, KBr, KI, K_3PO_4 , and NaN_3) has been investigated in an effort to elucidate the mechanism of the enhancement of water compared to that for other adsorbates. (It is well known, for example, that pyridine exhibits large enhancement in 0.1 M KCl while SERS from water is not detectable unless the salt concentration is raised to almost 1 M.) Use of an optical multichannel analyzer allowed rapid recording of Raman spectra, and SERS intensities of adsorbates could therefore be monitored simultaneously during a continuous oxidation-reduction cycle. Potential dependencies of SERS intensities when the electrode potential is cycled in a non-faradic potential range immediately following oxidation and reduction indicate that adatoms are partially responsible for the Raman enhancement. Furthermore, the anions in the electrolyte play an important role in stabilizing these 'active sites'. For this reason, the degree of enhancement is influenced by the solubility of the Ag compound formed during oxidation and the specific adsorption of the anions to the Ag surface. (no refs.)

62986 EMIRS study of adsorbate bonding in the electrode solution interfacial region. A.Bewick, C.Gibilaro, N.Razaq (Dept. of Chem., Southampton Univ., Southampton, England), J.W.Russell.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.191-6 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

EMIRS spectra for ^{12}CO , ^{13}CO mixtures on platinum, HSO_4^- and acrylonitrile on gold and water on silver are discussed. These examples illustrate the adsorbate identification, bonding, and orientation information which EMIRS data offer to complement electrochemical Raman data and infrared reflection absorption and EELS results. The advantages of experimental fine control of the electronegativity of the metal are shown with application to studies of coupling mechanisms between adsorbed species. (10 refs.)

62987 Spectral properties of pyrazine adsorbed on silver electrodes and cold silver films from surface enhanced Raman scattering (SERS). R.Dornhaus (I. Phys. Inst., Rheinisch Westfaelische, Tech. Hochschule Aachen, Aachen, Germany).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.197-202 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Surface enhanced Raman spectra of molecules adsorbed on electrode surfaces, metal-island films, colloidal particles and UHV-evaporated low-temperature substrates often show considerable differences in mode strength and positions between each other and the bulk molecular spectrum. These differences and their possible origins are discussed for pyrazine adsorbed on silver electrodes and cold silver films. (15 refs.)

62988 SERS study of pyridine vapor exposed to silver substrates electrochemically prepared. A.Regis, P.Dumas, J.Corset (Lab. de Spectrochimie, CNRS, Thiais, France).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.203-8 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Silver electrodes, previously prepared in KCl, KBr and KNO_3 electrolyte solutions, are exposed to a saturated vapour of pyridine, at room temperature. Surface complexes involving a silver halide and pyridine are detected during the gas-solid interaction. A low frequency band was observed, without exposure to pyridine, when a large amount of silver halide deposited on the electrode, is irradiated with a laser blue line. Photoreduction of the silver halide into metal aggregates occurs during the exposure to the laser. Some hypothesis about the absorption of pyridine at room temperature are advanced from results obtained with a silver electrode prepared in a KNO_3 solution. (10 refs.)

62989 Study of adsorption at the electrode/solution interphase by in-situ infrared reflectance spectroscopy—adsorption of methanol on a platinum electrode. K.Kunimatsu (Res. Inst. for Catalysis, Hokkaido Univ., Sapporo, Japan).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.215-20 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

A detailed study has been carried out on the electrode potential dependence of spectra of adsorbed CO molecules produced by chemisorption of methanol molecules on a platinum electrode between 0.05 and 0.8 V (NHE). It has been shown that, in addition to the effect of surface charge on the band position, there is a considerable effect of co-adsorbed hydrogen species on the spectra which gives rise to the broadening of the band and to the lowering of the wave number for the maximum absorption. (11 refs.)

62990 Intensity enhancement and spectral change in Raman scattering of mercaptobenzothiazole adsorbed on silver electrode. M.Ohsawa, W.Suetaka (Lab. of Interface Sci. of Metals, Tohoku Univ., Sendai, Japan).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.221-6 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Mercaptobenzothiazole is adsorbed on silver electrodes in the form of ionized-thiol. Sudden changes in Raman intensity were observed in changing the concentration at 1×10^{-8} and $1\times 10^{-6}\text{ mol/l}$. The former change may be ascribed to the change in orientation of adsorbed molecule and the latter to the formation of multilayered film. The largest enhancement in Raman intensity is obtained for the species adsorbed in normal orientation. The addition

of halide ion resulted in the conversion of the thiol species to the thione one. The conversion may be related to the effect of halide ion impeding anticorrosion action of mercaptobenzothiazole. (6 refs.)

62991 Time dependence of surface enhanced Raman scattering during and after oxidation-reduction cycles. M.R.Philpott (IBM Res. Lab., San Jose, CA, USA), F.Barz, J.G.Gordon, II, M.J.Weaver.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.227 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given, as follows. The time-development of surface enhanced Raman scattering from silver electrodes immersed in simple electrolytes has been measured during and after oxidation-reduction cycles of the linear scan double step type. Raman spectra were recorded in times as short as 0.1 second, using a spectrograph equipped with an optical multichannel detector and analyzer. Correlations between Raman spectra and current or charge passed were found, and in mixed electrolytes the displacement of one anion by a more strongly adsorbing anion was observed. In addition, unexpectedly strong effects of laser irradiation and hydrogen evolution prior to the oxidation-reduction cycle have been observed in the intensity of SERS bands after the cycle. These last two effects are attributed to peculiar surface morphologies. (no refs.)

62992 Vibrational and electronic spectra of $\text{Na}[\text{UO}_2(\text{CH}_3\text{COO})_3]$. C.D.Flint, P.Sharma (Dept. of Chem., Birkbeck Coll., Univ. of London, London, England).

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.2, p.317-21 (Feb. 1983).

Raman, infrared, electronic absorption and luminescence spectra of $\text{Na}[\text{UO}_2(\text{CH}_3\text{COO})_3]$ have been measured at temperatures down to 10K. Multiple structure in the region of the lowest-energy electronic origin is shown to be due to the presence of a substantial concentration of defect sites. In the luminescence spectra these defect sites are populated by energy transfer from the majority species. Most of the vibrational modes of the uranyl and acetate groups have been identified and their vibronic intensity mechanism in the electronic spectra discussed. (11 refs.)

62993 Special features of angular dependence of spontaneous Raman scattering in LiNbO_3 . A.E.Semenov, E.V.Cherkasov.

Opt. & Spectrosc. (USA), vol.53, no.1, p.107-8 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.180-2 (July 1982). [received: April 1983]

Presents experimental data concerning the peculiarities of the polarized Raman spectra in nominally pure and iron-doped LiNbO_3 single crystals (C_{3v} point group) within the temperature interval $T=20-600^\circ\text{C}$. (5 refs.)

62994 High-frequency edge of tetragonal barium titanate Raman spectra.

A.A.Kukharskii.

Opt. & Spectrosc. (USA), vol.53, no.1, p.109-10 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.182-4 (July 1982). [received: April 1983] (20 refs.)

62995 Raman scattering in Bi_2SiO_5 and Bi_2GeO_5 single crystals.

G.A.Babonas, Yu.G.Zaretskii, G.A.Kurbatov, Yu.I.Ukhanov, Yu.V.Shmartshev. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.211-12 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.358-61 (Aug. 1982). [received: April 1983]

Results obtained on the frequencies of spectral lines in the present work and previously (see S. Venugopalan and A.K. Ramdas, *Phys. Rev. B*, vol.5, p.4065, 1972 and W. Wojdowski et al., *Phys. Status Solidi B* vol.94, p.649, 1979) are compared. The total number of lines obtained in the Raman spectra for BGO and BSO is practically the same. (The Raman spectra of BSO consist of 47 lines, and those of BGO, 46 lines.) This result is natural for substances of very similar structure and makes it possible to postulate that the Raman spectra of other sillenites, obtained by means of a tetravalent metal oxide (TiO_2 , SnO_2 , etc.), will contain the same number of lines. (7 refs.)

62996 Temperature dependence of the $\tilde{E}-2A$ far-infrared absorption line of excited chromium ions in ruby. H.Lengfeller, J.Hummel, H.Netter, K.F.Renk (Inst. für Angewandte Phys., Univ. Regensburg, Regensburg, Germany).

Opt. Lett. (USA), vol.8, no.4, p.220-2 (April 1983).

By using far-infrared laser spectroscopy the authors have studied the temperature dependence of the absorption that is due to transitions between the $\tilde{E}^2(E)$ and $2A^2(E)$ levels of excited Cr^{3+} ions in ruby. From the temperature dependence of the linewidth the authors determined the inhomogeneous and the homogeneous contributions to line broadening. From the homogeneous width the lifetime of the $2A$ level was obtained. The authors found that, for temperatures up to 70K, the lifetime is due mainly to one-phonon relaxation, whereas at higher temperatures another relaxation process, probably a two-phonon Raman process, becomes strong. (11 refs.)

62997 Raman scattering in K_2SO_4 at high temperatures. M.Ishigame, S.Yamashita (Res. Inst. for Sci. Measurements, Tohoku Univ., Sendai, Japan).

Phys. Status Solidi b (Germany), vol.116, no.1, p.49-56 (1 March 1983).

Temperature dependence of Raman spectra of K_2SO_4 is measured in the temperature region from 300 to 1173K. A remarkable change of the Raman frequencies is not observed through the phase transition temperature T_c . Most of the Raman spectra measured above T_c can be explained by the vibrational modes of the K_2SO_4 crystal with space group D_{6h} . From the spectra of internal modes, however, it is suggested that a correlation between directions of two SO_4^{2-} ions in unit cell will exist locally in K_2SO_4 crystal above T_c . (8 refs.)

62998 Forbidden luminescence and resonance Raman scattering of bound exciton states in CdS. R.Baumert, I.Brosier, J.Gutowski, A.Hoffmann (Inst. für Festkörperphys., Tech. Univ. Berlin, Berlin, Germany).

Phys. Status Solidi b (Germany), vol.116, no.1, p.261-7 (1 March 1983).

A series of six energy levels is found at energy distances 2.5, 3.8, 4.7, 6.1, 7.0, and 8.3 meV on the high energy side of the neutral-acceptor bound exciton I_1 in CdS. They appear in the emission and absorption spectra of some freshly grown virgin crystals and of some crystals damaged by laser-irradiation. Resonance Raman scattering (RRS) establishes the new levels as intermediate states in every high quality crystal. These levels are interpreted as excited states of the bound exciton I_1 . The direct radiative recombination is forbidden due to parity selection rules. These selection rules are removed in symmetry disturbed crystals, at high excitation intensities, or by recombination with phonon participation. In consequence they are detected as forbidden luminescence, as LO phonon replica, or as 1-LO- and 2-LO-Raman lines. The 2-LO scattering cross section of the energy region of bound excitons in CdS is determined. (23 refs.)

62999 FTIR studies of polymer blends containing the poly(hydroxy ether of bisphenol A) and poly(ϵ -caprolactone). M.M.Coleman, E.J.Moskala (Dept. of Materials Sci. & Engng., Pennsylvania State Univ., University Park, PA, USA).

Polymer (GB), vol.24, no.3, p.251-7 (March 1983).

Fourier transform infra-red (FTIR) studies of the polymer blend system poly(hydroxyl ether of bisphenol A) (phenoxy)-poly(ϵ -caprolactone) (PCL) are presented. These two polymers are miscible in the amorphous state and information concerning the presence and nature of intermolecular interactions between the two polymers has been gained. Specifically, direct evidence has been obtained for a hydrogen bonding interaction between the PCL carbonyl group and the phenoxy hydroxyl group. Significantly, the relative strength of this interaction is found to be weaker than the corresponding intermolecular hydrogen bonding interaction in pure phenoxy. In contrast, a cursory FTIR study of phenoxy-poly(ethylene oxide) blends reveals that the intermolecular interaction occurring between these two polymeric components is stronger than that occurring in pure phenoxy. In addition, PCL is a crystallizable polymer and studies performed on the PCL-phenoxy blends at room temperature have led to further information on the state of order of PCL in these blends. The ramifications of these results are discussed. (21 refs.)

63000 Raman spectrum of n-propylamine in cyclohexane. B.Ri.Friedman, M.Schwartz (Dept. of Chem., North Texas State Univ., Denton, TX, USA).

Spectrosc. Lett. (USA), vol.15, no.12, p.945-52 (1982).

Polarized (isotropic) Raman spectra of the N-H valence region of n-propylamine have been recorded as a function of concentration in cyclohexane. Statistical analysis of the data using non-linear least squares techniques revealed the presence of a fourth spectral band in this region, not observed in an earlier IR study. This latter peak has been assigned to vibrations of monomers in the liquid. The resolved spectral parameters are consistent with a picture of diminishing molecular association upon dilution of the amine in this non-polar solvent. (13 refs.)

63001 Interference effects in resonant Raman scattering by S_2^- molecules in crystalline KI. L.A.Rebane, A.A.Khaav (Phys. Inst., Acad. of Sci., Tartu, Estonian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1452-5 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2558-63 (Sept. 1982). [received: April 1983]

The resonant Raman scattering cross section for S_2^- molecules in crystalline KI at 5K was studied as a function of excitation frequency. Minima were observed in the cross section when the excitation lay in the zero phonon line and in the phonon wing of the impurity absorption spectrum, and their theoretical explanation is given. (18 refs.)

63002 Resonance interband Raman scattering of light in semiconductors.

V.I.Belitskii, A.V.Gol'tsev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.9, p.1462-5 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2578-84 (Sept. 1982). [received: April 1983]

It is shown that the profile of a resonance line in the spectrum of the interband electron Raman scattering is Lorentzian only for certain values of the parameter $t=\gamma_{\mu 1}/\gamma_{\mu 0}$, where $\gamma_0^{-1}(\gamma_1^{-1})$ is the lifetime of electrons in the upper (lower) conduction band; $\mu=m_e m_0/(m_c+m_0)$, and m_c and m_0 are, respectively, the effective masses of an electron in the i th conduction band and of a hole in the valence band. When the interaction of electrons with longitudinal optical phonons is considered, the spectrum of the interband Raman scattering of light is shown to contain not only the principal resonance line but also a series of phonon replica lines. An interpretation of the resulting expression for the cross section of the Raman scattering based on the concepts of resonance scattering and hot luminescence is discussed. (12 refs.)

63003 Experimental investigation of the nature of infrared absorption by single crystals of α -LiIO₃. V.I.Bredikhin, L.A.Dmitrenko, N.V.Kiseleva, V.V.Korolikhin, M.A.Kotova, M.A.Novikov, V.I.Rubakha (Inst. of Appl. Phys., Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.557-9 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.928-31 (Sept.-Oct. 1982). [received: April 1983]

The absorption spectra of α -LiIO₃ crystals, grown from solutions with various degrees of acidity, are investigated at wavelengths of 2.5-5.5 μ . By means of a comparison with the adsorption spectra of crystals of α -HIO₃ and of a solution of LiIO₃ in H₂O, it is shown that the absorption band with a maximum at 2.9 μ is due to inclusions of mother liquor, and that at 3.5 μ to HIO₃ present in the crystal. (5 refs.)

63004 Raman scattering of light in crystals in the presence of Bose-Einstein condensate excitons. Yu.D.Zavorotnev, L.I.Stefanovich.

Ukr. Fiz. Zh. (USSR), vol.28, no.3, p.348-53 (March 1983). In Russian.

Treats the effect of Raman scattering whose elementary act is characterized by a polariton annihilation and generation of a polariton with a modified frequency and a condensate exciton. For certain frequencies of pumping in the direction of the primary radiation, extension in the Stokes region of the spectrum it is accompanied by an appearance of a 'needle-like' line which is more intense than the Raman scattering line in the absence of the condensate. A tensor of scattering is established which is in coincidence with the tensor of the common Raman scattering. An example is given for cubic and uniaxial crystals to demonstrate at which geometry of scattering the said effect can be observed. (12 refs.)

63005 IR reflection investigation of corrosion of optical glasses. R.Stephonowitz (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany).

Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.31, no.6, p.1017-23 (1982). In German.

Infrared reflection spectroscopy was used for characterizing corrosion of glass surfaces. Different corrosion agents cause typical reflection spectra. A table of the most important reflection peaks is given. (12 refs.)

63006 Raman spectroscopic investigations of polymethine dyes. K.Kneipp, G.Hinzmann, D.Fassler (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany).

Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.31, no.6, p.1119-23 (1982). In German.

Spontaneous resonance Raman spectroscopic investigations of some polymethine dyes are reported. The resonance excitation behaviour of one dye was investigated quantitatively. (8 refs.)

78.35 BRILLOUIN AND RAYLEIGH SCATTERING

- 63007 Induced isotropic scattering from liquid carbon dioxide. A.de Santis, M.Sampoli (Istituto di Fisica, Univ. di Venezia, Venice, Italy). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.1, p.114-18 (25 March 1983). The lineshape of the isotropic induced scattering has been measured from polarized and depolarized Rayleigh bands of CO₂ fluid. A comparison with other 'collision-induced' spectra has been performed. It is argued that the scattering is dominated by two- and three-body interactions. (22 refs.)
- 63008 Time dependent light scattering studies of phase separation in polymer blends. H.L.Snyder, P.Meakin (Central Res. & Dev. Dept., E.I. du Pont de Nemours & Co., Wilmington, DE, USA), S.Reich. *J. Chem. Phys. (USA)*, vol.78, no.6, pt.1, p.3334-6 (15 March 1983). The authors used a light scattering technique to obtain experimental information related to the time development of structural dynamics resulting from a liquid-liquid phase separation process in high molecular weight polymer blends, and report $S(k)$ measurements on early stage phase separation processes in high molecular weight polymers. The blends studied were composed of polystyrene with a GPC M_w of 60000 and a polydispersity of four and poly(vinylmethyl ether) with a GPC M_w of 63000 and a polydispersity of approximately two. (11 refs.)

63009 Electrophoretic light scattering studies of poly(L-lysine) in the ordinary and extraordinary phase. Effects of salt, molecular weight, and polyanion concentration. J.P.Wilcoxon, J.M.Schurr (Dept. of Chem., Univ. of Washington, Seattle, WA, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3354-64 (15 March 1983). Electrophoretic light scattering (ELS) is employed to determine the electrophoretic mobilities μ_E and apparent diffusion coefficients D_{ELS} obtained from ELS linewidths for three samples of poly(L-lysine)HBr (PLL) of degree of polymerization $n=406$, $n=946$ and $n=2273$ as a function of salt (C_s) and polyanion (C_p) concentration. Dynamic light scattering (DLS) is used to determine apparent diffusion coefficients D_{app} of these same PLL samples in the absence of the applied field. The polyelectrolyte system exhibits an ordinary to extraordinary phase transition at low salt concentrations that is manifested by a more than 50-fold decrease in D_{app} as well as a twofold decrease in scattered intensity. In the extraordinary phase, the D_{ELS} values are typically very small, though still somewhat (frequently twofold) larger than D_{app} . When the salt concentration is raised to enter the ordinary phase D_{ELS} remains small, less than one tenth of D_{app} in the low-salt end of the ordinary phase, but increases with increasing C_p to become comparable with, though still about twofold smaller than, D_{app} in 0.1 M NaBr. The fluctuations in polyanion density responsible for the observed ELS signal are evidently relaxed very slowly under low-salt conditions, regardless of which phase prevails. In the ordinary phase μ_E increases rapidly with decreasing C_s , but in the extraordinary phase μ_E either remains nearly constant for ($n=946$), or actually decreases (for $n=2273$), as C_s decreases further to 0. The present μ_E data disagree with a previous empirical prediction of Schurr (1980) and rule out the particular interpretation of the diffusion virial coefficient upon which that was based. The theory of Manning (1981) predicts a value of the tracer mobility μ_p that is quite close to the value of μ_E observed for (lys)₄₀₆ at $C_s=0.1$ M, but predicts much too large an increase in μ_p with decreasing C_s , and fails to predict the significant molecular weight dependence of μ_E observed in the intermediate C_s range near 0.02 M. It is pointed out that incorporation of electrolyte friction into Manning's theory could improve the agreement with experiment. (30 refs.)

63010 Geometrical dependence of Raman and Rayleigh scattering intensities in fluids. C.D.Churcher, G.E.Stedman (Dept. of Phys., Univ. of Canterbury, Christchurch, New Zealand).

J. Phys. B (GB), vol.16, no.7, p.1303-18 (14 April 1983).

Angular momentum coupling techniques are used to determine the geometrical dependence of two-photon scattering effects in orientationally averaged systems under quite general conditions including chiral and linear field-induced effects and M2 and E3 couplings. The geometrical dependence of the intensity is separated from the physical constants and is expressed in terms of scalar and vector products of the polarisation and external field vectors. Independent measurements are suggested which suffice to determine completely the scattering properties of any fluid under a variety of constraints (symmetry of a scatterer, photon multipole coupling, applied field). Associated symmetries of, or selection rules on, such intensity contributions are analysed in detail. In Rayleigh scattering, for example, linear effects from an electric field in E1 coupling are forbidden, intensity contributions are always symmetric in incoming and outgoing photon labels and are symmetric or antisymmetric under time inversion of these photons as the applied field is time-even or time-odd. Attention is also given to the effects caused by alignment or distortion of the scatterers by the external field. (19 refs.)

63011 Interpretation of quasi-elastic light scattering data for flexible chains: model dependence. D.E.Kranbuehl (Dept. of Chem., Coll. of William & Mary, Williamsburg, VA, USA), P.H.Verdier. *Polymer (GB)*, vol.24, no.4, p.383-6 (April 1983).

The autocorrelation functions and corresponding relaxation times obtained from the forward depolarized quasi-elastic light scattering experiment are exhibited for two quite similar models of flexible polymer chains in solution. A very small change in the chain dynamics is found to be sufficient to change the relaxation time from a relatively short time independent of chain length, with an autocorrelation function suggestive of an unweighted sum of contributions from all the relaxation times in the spectrum of chain motion, to a long time with an autocorrelation function identical with that for the end-to-end vector, strongly dependent upon chain length and dominated by the longest relaxation time in the spectrum. 78.40 VISIBLE AND ULTRAVIOLET SPECTRA

- 63012 Pure electronic, vibronic, and two-particle surface excitons on the anthracene crystal. II. Experimental study and analysis of the (0,1) region. J.Bernard, M.Orrit, J.M.Turlet, Ph.Kottis (Centre de Phys. Moléculaire Optique et Hertzienne, Univ. de Bordeaux I, Talence, France). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.1, p.2857-65 (15 March 1983). For pt.1 see ibid., vol.78, no.6, p.2847 (1983). In this second part, the authors present the experimental and theoretical study concerning vibronic surface transitions for the vibration modes 390 and 1400 cm⁻¹. They begin by a theoretical discussion of the different limiting cases of exciton-vibration coupling. In the experimental part, evidence of the surface character for the observed structures in surface emission excitation spectra is provided by their shifts upon surface coating. A general similarity of the surface states with the previously described bulk states, including a translational equivalence ($\delta=206$ cm⁻¹), is established. The observed structure are assigned to interacting single particle (vibron) resonances and two-particle bands. However, some slight discrepancies between surface and bulk band structures lead them to question the complete validity of their translational equivalence. Finally, the authors' observations show that the surface two-particle excitation profile (peak shaped) is quite different from the surface two-particle absorption profile (stepwise threshold profile). They propose a model mechanism of the surface

excitations relaxation which accounts quantitatively for this specific surface excitation profile. (19 refs.)

63013 Direct and indirect exciton transitions in $\text{InBr}_3\text{I}_{1-x}$ mixed crystals. M.Yoshida, N.Ohno, K.Nakamura, Y.Nakai (Dept. of Phys., Kyoto Univ., Kyoto, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1108-10 (April 1983).

Reflection and absorption spectra of $\text{InBr}_3\text{I}_{1-x}$ mixed crystals have been measured at 2K by using polarized light. The lowest reflection peak shifts continuously from InI to InBr indicating the intra-cationic nature of the first exciton transition. In the absorption spectra of the mixed crystals with low iodine concentration, zero-phonon indirect exciton transition is identified and concentration dependence of its threshold energy is investigated. It is confirmed that the indirect-direct crossover occurs at the composition $x \approx 0.5$.

63014 A study of optical absorption edges in copper-calcium phosphate glasses containing iodine. C.A.Hogarth, A.A.Novikov (Dept. of Phys., Brunel Univ., Uxbridge, England).

J. Phys. D (GB), vol.16, no.4, p.675-8 (14 April 1983).

A series of glass specimens was prepared from mixtures of CuO , CaO , P_2O_5 and CuI and their optical absorption coefficients were measured as functions of photon energy in the range 3.0 to 4.5 eV. From the results the values of the optical energy gap are calculated and found to depend quite sensitively on the added iodine. (9 refs.)

63015 Kramers-Kronig analysis of the reflection spectra of $\text{Ba}_2\text{NaNb}_2\text{O}_{15}$. A.M.Mamedov, V.I.Shilnikov, I.S.Ibragimova, K.M.Nurieva, I.M.Efendieva. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.2-3 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.5-7 (July 1982). [received: April 1983] Reports measurements of the normal reflection spectrum ($\theta \approx 12^\circ$) of $\text{Ba}_2\text{NaNb}_2\text{O}_{15}$ (BSN) single crystals over the 0.1-35.0-eV energy range and over the 10-500K temperature range. This is one of the oxygen-octahedron crystals that exhibit strong nonlinear optical properties. Two spectral instruments were used: (1) a McPherson 225 vacuum monochromator with a 1200-line/mm diffraction grating, (2) a Perkin-Elmer 301 spectrometer ($\hbar\omega = 0.1-3.5$ eV). The experimental data were subjected to a Kramers-Kronig analysis to calculate the real and imaginary parts of the dielectric function $\epsilon = \epsilon_1 - i\epsilon_2$ and the energy-loss function $-\text{Im}\epsilon^{-1} = -\epsilon_2/(\epsilon_1^2 + \epsilon_2^2)$, which is a measure of the collective oscillations of valence electrons. The spectrum of the optical conductivity, $\sigma = 2\pi\hbar\omega$ is also shown. Comparison of the α and σ spectra shows that the energy positions of the maxima of these optical functions are correlated well. The spectra of k and ϵ_2 in contrast are similar to the spectrum of R and reach maxima at $\hbar\omega = 5.0-10.0$ eV. The small values of ϵ_1 and ϵ_2 for these single crystals should be noted; these values imply that the bonding of BSN is very ionic. (7 refs.)

63016 Effect of oxygen on exciton spectra of ZnS lower polytypes and samples with packing defects. N.K.Morozova. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.98-9 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.166-9 (July 1982). [received: April 1983]

The author found that ZnS polytype forms having hexagonal structure dissolve oxygen readily without formation of packing defects, and this substantially influences the width of their forbidden zone. To exclude the influence of dissolved oxygen, investigations were undertaken of single crystals of the ZnS polytype forms 2H, 4H, 6H, 8H, 3C obtained in a circulating system from the gas phase in H_2S at 1300°C. Results of exciton spectra of reflection are presented and it is evident that exclusion of the influence of oxygen gives linear dependence of E_g or the A exciton on α . The sizes of the energy gaps E_{AB} and E_{AC} change nonlinearly, which corresponds to a nonlinear displacement of the bands of the B and C excitons in the spectra. (6 refs.)

63017 Electoreflexion of ground-state excitons in $\text{A}^{\text{IV}}\text{B}^{\text{VI}}$ crystals. V.E.Mashchenko, A.V.Khomich, A.I.Ziborov.

Opt. & Spectrosc. (USA), vol.53, no.2, p.166-8 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.284-7 (Aug. 1982). [received: April 1983]

The increments in the electric field of the real ($\Delta\epsilon_1$) and imaginary ($\Delta\epsilon_2$) parts of the complex permittivity have been calculated for a transition to the exciton ground state in CdSe, CdS, and ZnSe crystals at 77K. The computations used high-resolution experimental electoreflexion spectra and calculated data for the spectra of the absorption coefficient and refractive index in the region of exciton resonance. It is shown that the invariant form of the electoreflexion (ER) extremes of ground-state excitons in fields of the order of 10^3 V/cm⁻¹ is determined by the fact that the dominant contributions in the ER spectrum are introduced by absorption processes. The computed $\Delta\epsilon_2$ spectra repeat the spectral curve of the ER extremes of the ground state and are described by the second derivative of the absorption contour with regard to the Lorentz energy. Such a shape for the ER extremes of ground-state excitons is attributable to broadening of the lines in the electric field. (16 refs.)

63018 Study of electronic structure of reduced TiO_2 and $\text{V}_x\text{Ti}_{1-x}\text{O}_2$ crystals by ESCA and optical absorption. K.Sakata (Nat. Res. Inst. for Metals, Tokyo, Japan).

Phys. Status Solidi b (Germany), vol.116, no.1, p.145-53 (1 March 1983).

An analysis is made of optical absorption spectra and electron spectroscopy for chemical analysis (ESCA) on pure TiO_2 , reduced TiO_2 , and $\text{V}_x\text{Ti}_{1-x}\text{O}_2$. It is found that in the reduced TiO_2 , the film takes the variable valence states, Ti^{4+} , Ti^{3+} , Ti^{2+} , and they form a broad donor band which overlaps with the conduction band originating from $\text{Ti}4s$ levels. 3d-4s mixing results in a large change of the conductivity of TiO_2 from insulator to metal depending upon the degree of reduction. In TiO_2 doped with V, which behaves like a free ion, the excess 3d electrons of the V ions form impurity level just above the $02p$ valence band. In the reduced $\text{V}_x\text{Ti}_{1-x}\text{O}_2$, four different valence states, Ti^{4+} , Ti^{3+} , Ti^{2+} , and V^{4+} , are found and this accounts for the narrow optical gap of this material. (24 refs.)

63019 Exciton-phonon interaction in crystalline and vitreous SiO_2 . I.T.Godmanis (Inst. of Solid State Phys., Latvian State Univ., Riga, Latvian, USSR), A.N.Trukhin, K.Hubner.

Phys. Status Solidi b (Germany), vol.116, no.1, p.279-87 (1 March 1983).

An investigation of the Urbach rule in crystalline SiO_2 (α -quartz), crystalline SiO_2 -Ge, and vitreous SiO_2 in the framework of the models of Dow and Redfield (1972) and of Toyozawa (1964) shows that the fundamental optical absorption edge of SiO_2 is determined by strong exciton-phonon interactions. In the crystalline and vitreous SiO_2 low-energy excitons with $E = 9.1$ eV (α -quartz) and $E = 8.7$ eV (glass) interact mainly with longitudinal optical phonons. In the crystalline SiO_2 -Ge alloy the interaction with phonons is realized by excitons localized on germanium impurities. The exciton-phonon interaction in SiO_2 -Ge and vitreous SiO_2 is stronger than in crystalline SiO_2 due to the higher degree of localization of low-energy excitons in these disturbed SiO_2 forms. The strong exciton-phonon interaction leads to a momentary self-trapping of the low-energy excitons in crystalline and non-crystalline SiO_2 , and to a corresponding relaxation of the SiO_2 -Ge excitons localized on Ge impurities. Numerical values of the fundamental exciton parameters are deduced and discussed. (39 refs.)

63022 One- and two-photon spectra of $\text{NaF}:\text{Cu}^+$: Jahn-Teller and vibronic coupling effects. S.A.Payne, A.B.Goldberg, D.S.McClure (Dept. of Chem., Princeton Univ., Princeton, NJ, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3688-97 (15 March 1983).

Notwithstanding the fact that CuF does not exist, the dilute solid solution $\text{NaF}:\text{CuF}$ is stable. One- and two-photon spectra of the cubic single crystals were obtained for the near ultraviolet $3d^{10} \rightarrow 3d^9 4s$ transitions of Cu^+ over a range of temperatures from 2 to 300K. The two-photon polarized spectra allowed the separation of the E_g from the T_{2g} spectra, and revealed the double humped band characteristic of the Jahn-Teller effect. Zero phonon lines were observed in the two-photon spectra, and a progression in a low frequency t_{1g} mode was observed with even quanta in the two-photon, odd quanta in the one-photon spectra. From the fine structure and from the temperature dependence of the broad bands, information about the potential function of the Cu^+ in NaF was derived for d_{1g} , e_g , and t_{1g} coordinates. The Cu^+ is on center in the ground and excited states. The value of E_{JT} is 2250 cm^{-1} and 10 Dq is 1800 cm^{-1} for the d^9 configuration. (26 refs.)

63023 Site-selection spectroscopy of Eu³⁺-doped germinate glass. Xu Gang, G.Boulon, R.C.Powell (Dept. of Phys., Oklahoma State Univ., Stillwater, OK, USA).

J. Chem. Phys. (USA), vol.78, no.7, p.4374-8 (1 April 1983). A tunable dye laser was used to selectively excite Eu³⁺ ions in nonequivalent types of crystal field sites in a germinate glass host. The results demonstrate the existence of three major types of sites in this host. In addition, time-resolved spectroscopy results show the presence of energy transfer between ions in these different types of sites. (12 refs.)

63024 Tunnelling motion of dipolar impurities in alkali halides: the KI:NO₂⁻ system [IR spectra]. S.S.Khatir, A.L.Verma (Dept. of Phys., North-Eastern Hill Univ., Shillong, India).

J. Phys. C (GB), vol.16, no.11, p.2157-64 (20 April 1983). Motional states of the NO₂⁻ ion doped in KI single crystals have been investigated using high-resolution infrared techniques. At very low concentrations of the impurity, the antisymmetric stretching vibration (ν_3) of the NO₂⁻ ion shows multiplet structure at 1.7K. This structure can be understood in terms of contributions of different types of tunnelling motions of the NO₂⁻ ion among the twelve equivalent potential wells in the KI lattice. An attempt has been made to give an estimate of the potential barrier hindering reorientation of the ion in the KI lattice. (14 refs.)

63025 Influence of the resonance interaction between molecules of a crystal and impurities on the Rashba effect for several impurity centers in molecular crystals. L.Valkunas, G.Vektaris.

Opt. & Spectrosc. (USA), vol.53, no.1, p.49-50 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.86-8 (July 1982). [received: April 1983]

A model of an impurity center is studied in which a level of localized excitons interacts resonantly with an impurity level. This interaction determines the optical properties of localized levels for crystals with a weak oscillator strength of the intramolecular transition in the case of a distribution of localized and impurity levels at a specific distance from the exciton band and close to one another. In the opposite case, when the localized level is located near the exciton band, the Rashba effect occurs. Numerical calculations are carried out for the naphthalene crystal. (6 refs.)

63026 Semiempirical calculation of optical-ionization energy for the Ti⁰ center in a KCl crystal. A.N.Ermoshkin, E.A.Kotomin, R.A.Evarestov, I.A.Tale.

Opt. & Spectrosc. (USA), vol.53, no.1, p.112-13 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.186-9 (July 1982). [received: April 1983]

Discusses a method and the results of a quantum-chemical semiempirical calculation of the energy of optical ionization of the Ti⁰ activator center in KCl crystal. The thallium atom impurity is located at a cation node of the lattice and is negatively charged relative to it. The authors used the semiempirical method of Mulliken-Rudenberg (self-consistent with respect to charge and configuration) within the framework of a model of a molecular cluster. (12 refs.)

63027 Mechanism for the annealing out of radiation-induced Eu²⁺ from barium orthophosphate. V.G.Krongauz, L.M.Kanskaya, I.Kh.Shaver.

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.433-4 (Aug. 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.1003-5 (Aug. 1982). [received: April 1983]

The activator in the X-ray phosphor Ba₃(PO₄)₂:Eu is present in the form of both Eu²⁺ and Eu³⁺ ions. X-ray bombardment converts part of the Eu²⁺ into Eu³⁺. The thermal annealing out of the radiation-induced Eu²⁺ is completed at 550-600K. A hole mechanism is most probably responsible for this annealing out. After X-ray bombardment at 77K, a Ba_{2.98}Eu_{0.02}(PO₄)₂ sample was illuminated with an incandescent lamp. The illumination caused the amount of Eu²⁺ (monitored on the basis of the intensity of the emission upon intracenter excitation: an absorption band peaking near 4.0 eV) to increase beyond the amount caused by the X-radiation. Simultaneously, the number of electrons at nonactivator capture centers decreased. (4 refs.)

78.55 PHOTOLUMINESCENCE

63028 Quenching of the delayed fluorescence by charge carriers in crystals of anthracene-TCNB CT complex. J.Funfschilling, M.Samoc, D.F.Williams (Nat. Res. Council, Ottawa, Ontario, Canada).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.157-60 (1 April 1983). The decrease in delayed fluorescence intensity in anthracene-tetracyanobenzene upon application of an electric field is investigated. It is shown, that photogenerated free carriers are responsible for the observed quenching, and that the entity quenched is an intermediate state between a triplet-pair state and a fluorescent singlet state. A model is presented that identifies this state as a separated charge pair. This model can explain the main feature of the observations, namely the large quenching cross section, which is of the order of cross sections typical of carrier-carrier interactions. (15 refs.)

63029 Uniaxial stress and temperature dependences of photoluminescence in GaAs_{1-x}P_x. S.Narita, T.Kubota, M.Kobayashi (Dept. of Material Phys., Osaka Univ., Osaka, Japan).

Jpn. J. Appl. Phys. Part I (Japan), vol.22, no.3, p.467-74 (March 1983). The uniaxial stress and temperature dependences of the photoluminescence in GaAs_{1-x}P_x (x=0.38) are studied and three kinds of photoluminescence are observed. One of them is attributed to the surface anomaly and the other two annihilation of the bound excitons and donor-acceptor pair recombination. By combining the results of the uniaxial stress effect and the temperature change of the photoluminescence, the transition mechanisms for the luminescence are discussed.

63030 Photoluminescence in amorphous C:H films prepared by glow discharge charge decomposition of CH₄ or C₂H₆. I.Watanabe, M.Inoue (Dept. of Electronics, Faculty of Technol., Kanazawa Univ., Kanazawa, Japan).

Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L176-8 (March 1983).

Hydrogenated amorphous carbon films have been prepared by glow discharge decomposition of CH₄ or C₂H₆ gas. The films exhibit white photoluminescence with high efficiency and weak temperature dependence which can be observed even at room temperature. The peak energy and intensity of the emission band vary depending on gas temperature during glow discharge. The high efficiency and weak temperature dependence are suggested to result from a strong Coulomb interaction in photoexcited electron-hole pairs.

63031 Effect of annealing on photo-energy transfer in poly(2,6-dimethyl-1,4-phenylene oxide), polystyrene and their blends. M.Kryszewski, B.Wandelt (Polymer Inst., Tech. Univ., Lodz, Poland), D.J.S.Birch, R.E.Imhof, A.M.North, R.A.Pethrick.

Polym. Commun. (GB), vol.24, no.3, p.73-5 (March 1983). Observations of fluorescence intensity and lifetime in polystyrene, poly(2,6-dimethyl-1,4-phenylene oxide) and a blend of these show that annealing and storage permit chain packing rearrangements which favour non-radiative energy conversion and transfer processes at the expense of direct chromophore emission. (12 refs.)

63032 Electronic structure and luminescent properties of Cu⁺ and Ag⁺ impurity centers in NaCl. C.Pedrin (CNRS, Univ. Lyon-1, Villeurbanne, France), H.Chermette.

Int. J. Quantum Chem. (USA), vol.23, no.3, p.1025-32 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

Fluorescence studies of Cu⁺ and Ag⁺ impurity centers embedded in NaCl are reported. The multiple scattering X_α method is used to describe the electronic structure of these ions in NaCl matrix. It is shown that taking into account the external lattice potential is necessary to obtain good results which can be compared to experiment. This has been done through the computation of an embedded NaCl₆⁻ cluster potential. Moreover, in NaCl:Ag⁺, it is also necessary to include relativistic corrections in order to obtain a reliable energy diagram. This is easily done by use of the Wood Hamiltonian, which allows the self-consistent inclusion of Darwin and mass-velocity terms in MS X_α codes. A good quantitative agreement with experiment is finally obtained for the optical excitations and the emission mechanism of the luminescent centers. The metal-chlorine distance is predicted slightly larger than the NaCl bulk value and the harmonic force constant of the a_{1g} vibrational breathing deformation of the cluster is calculated and found in good agreement within experiment. For the first time the Stoke shift of such systems is evaluated. (12 refs.)

63033 Pure electronic, vibronic, and two-particle surface excitons on the anthracene crystal. I. General theoretical basis, experimental study, and analysis of the (0,0) region. M.Orrit, J.Bernard, J.M.Turlet, Ph.Kottis (Centre de Phys. Moléculaire Optique et Hertzienne, Univ. de Bordeaux I, Talence, France).

J. Chem. Phys. (USA), vol.78, no.6, pt.1, p.2847-56 (15 March 1983).

These two papers (papers I and II) present a complete study—theoretical and experimental—of the first singlet-singlet electronic and vibronic transitions of the anthracene crystal. The authors interpret the new observed structures in terms of pure electronic, vibronic, and two-particle site shift surface exciton states. The first paper (I) begins by a model description of the bulk and surface excitons in a rigid lattice. They then describe the experimental study of the anthracene crystal reflectivity and surface emission excitation at low temperatures with and without nitrogen coating of the crystal surface. For the first time, they clearly established the following results: (1) The existence and the accurate position of the upper a polarized Davydov component for the pure electronic surface exciton. (2) The equality within the experimental accuracy ($\approx 23 \text{ cm}^{-1}$), of the surface and bulk excitonic Davydov splitting ($\Delta = 223 \text{ cm}^{-1}$) and the translational equivalence ($\delta = 206 \text{ cm}^{-1}$) of the surface structures with their bulk counterparts; (3) A variation of the surface Davydov splitting when the crystal surface is coated with frozen nitrogen. (24 refs.)

63034 Anomalous temperature-dependent phosphorescence of Cu porphyrin in anthracene. J.Bohandy, B.F.Kim (Milton S. Eisenhower Res. Center, Johns Hopkins Univ., Laurel, MD, USA).

J. Chem. Phys. (USA), vol.78, no.7, p.4331-6 (1 April 1983).

The temperature dependence of the phosphorescence spectrum of copper porphyrin in anthracene has been studied from room temperature down to 8K and the 4.2K spectrum has been obtained. A 23.4 cm^{-1} crystal field splitting of the orbital components of the T₀ state was observed. The 0-0 transition appears abruptly at approximately 25K and increases rapidly in intensity as the temperature is lowered. A model involving energy transfer from the copper porphyrin to the triplet exciton band of anthracene gives a satisfactory explanation for the anomalous temperature dependence of the copper porphyrin phosphorescence intensity. (13 refs.)

63035 Low-temperature energy trapping and emission line profile of disordered solids. J.R.Morgan, M.A.El-Sayed (Dept. of Chem. & Biochem., Univ. of California, Los Angeles, CA, USA).

J. Phys. Chem. (USA), vol.87, no.3, p.383-5 (3 Feb. 1983).

In a disordered solid, where random excitation energy and donor-acceptor separation are expected, low-temperature energy transfer between a high-energy excited molecule to a lower-energy acceptor might not be complete. As a result, the emission profile of the solid at low temperature is determined by the energy distribution of the emission of the trapping sites. Predictions based on these ideas are used and a fit is made up to the 4.2K observed phosphorescence profile of 1-bromo-4-chloronaphthalene (BCN), an orientationally disordered molecular solid. The theoretical fit to the observed emission profile is discussed in terms of the possible energy transfer mechanism(s) in this solid. (12 refs.)

63036 Optical properties of copper-related centres in InP. M.S.Skolnick, P.J.Dean, A.D.Pitt, Ch.Uihlein, H.Krath, B.Deveaud, E.J.Foulkes (Royal Signals & Radar Estab., Great Malvern, England).

J. Phys. C (GB), vol.16, no.10, p.1967-85 (10 April 1983).

A new Cu-related photoluminescence band in InP is reported. It consists of a sharp zero-phonon line at 1.2889 eV with sharp LO and 'gap mode' local phonon replicas to lower energy superimposed on a broad vibronic background. Zeeman studies show that the recombination process arises from an exciton bound to a neutral isoelectronic centre. Electron and hole g-values of 1.27 and 2.12 respectively are deduced, with both electron and hole having spin 1/2. The very strong diamagnetic shift of the spectrum is found to be equal to that of a shallow donor electron in InP. This demonstrates clearly that the hole is tightly bound in the short-range potential of the centre with binding energy E_b^h = 127.5 meV and that the electron is then weakly bound in the Coulomb field of the hole (E_b^e = 7.3 meV), so that the overall behaviour is of an isoelectronic donor. The thermal activation energy of the vibronic

sideband of the luminescence is found to be 135 ± 10 meV, in good agreement with the spectroscopic value of the hole binding energy. (46 refs.)

63037 Long-term photoluminescence fatigue in $\text{Ge}_x\text{Se}_{1-y}$ glasses. J.M.Chamberlain, A.J.Moseley (Dept. of Phys., Univ. of Nottingham, Nottingham, England).

J. Phys. C (GB), vol.16, no.10, p.1987-98 (10 April 1983).

Photoluminescence fatigue (PLF) of $\alpha\text{-Ge}_x\text{Se}_{1-y}$ ($0.05 < y < 0.38$) is investigated at 4K for irradiation times of up to two hours. Previous analyses of PLF cross sections (F_f) are shown to be inappropriate. A model involving the fatiguing of an effective fraction of all PL centres is introduced. The spectral and compositional dependences of F_f are obtained with this new model, and the convergence of F_f and the cross section, F_{pa} , for photoinduced absorption (PA) is observed for $y=0.33$ material. An 'apparent' fatigue due to self-absorption at extrinsic centres created in the material after prolonged irradiation is shown to provide an important contribution to PLF for large integrated exposure. Previously reported discrepancies in F_f and F_{pa} at $y=0.33$ are attributed to neglect of this extrinsic centre PLF mechanism. Specific defect structures are suggested for this material using the tight-binding approach of Robertson (1980), and their radiative properties are discussed in terms of configuration coordinate models. The nonzero PL of $y=0$ material is accounted for without recourse to unknown impurities. Mechanisms for PA/PR and PLF are proposed and the convergence of F_{pa} and F_f is explained by $y=0.33$ in terms of the proposed defects. (14 refs.)

63038 Luminescence decay time of the 1.945 eV centre in type Ib diamond. A.T.Collins (Wheatstone Phys. Lab., King's Coll., London, England), M.F.Thomaz, M.I.B.Jorge.

J. Phys. C (GB), vol.16, no.11, p.2177-81 (20 April 1983).

The luminescence decay time of the 1.945 eV centre has been determined as 13 ± 0.5 ns for natural type Ib diamonds. For synthetic diamonds the value is slightly lower, probably because of competitive non-radiative recombination in these relatively impure crystals. The similarity of the decay time to that for the H3 centre further supports the model proposed for the vacancy-enhanced aggregation of nitrogen in diamond. No temperature dependence of the 1.945 eV decay time has been detected in the range 77-700K, and this result is not inconsistent with the energy level scheme used to interpret ESR data for the 1.945 eV centre. (13 refs.)

63039 Characterisation of Mn-doped and nominally pure LPE $\text{Ga}_{1-x}\text{In}_x\text{As}_y\text{P}_{1-y}$ ($y=2.1x$) between $y=0$ and $y=1$ using photoluminescence and electrical measurements. A.W.Smith (Dept. of Phys., Univ. of Nottingham, Nottingham, England), L.G.Shantharama, L.Eaves, P.D.Greene, J.R.Hayes, A.R.Adams.

J. Phys. D (GB), vol.16, no.4, p.679-86 (14 April 1983).

Photoluminescence (PL) and electrical measurements have been made on a series of p-type, Mn-doped layers of $\text{Ga}_{1-x}\text{In}_x\text{As}_y\text{P}_{1-y}$ ($y=2.1x$) grown by liquid phase epitaxy on InP substrates and of a similar series of nominally pure crystals used as control samples. For small y , the Mn-doped samples shown an intense Mn-related PL band with a zero-phonon structure at 1.185 eV (4K) for the $y=0$ (InP) sample. This locates the Mn-acceptor level at 230 meV above the valence band edge. The PL band can be followed up to $y=0.40$ and the Mn-acceptor energy E_A is estimated to vary as (230-185) meV. For larger y , a broad, though strong, PL is observed on the low energy side of the near-band-edge lines. At these higher y values, electrical measurements have been used to determine E_A , giving $E_A=49$ meV for $y=0.93$ and 0.10 eV for $y=0.70$, in fairly good agreement with linear extrapolation of the PL data. The low temperature PL of six undoped control samples ($0.5 < y < 1$) reveal two sharp PL lines at (1.02-0.33y) and (1.00-0.33y) eV of as yet unknown origin. (19 refs.)

63040 Magnetic-field-induced breakdown of correlation between spins and moments of photoexcited electrons in GaAs crystals. I.Ya.Karlik, D.N.Mirlin, L.P.Nikitin, D.G.Polyakov, V.F.Sapega (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Moscow, USSR).

JETP Lett. (USA), vol.36, no.5, p.192-4 (5 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. i Teor. Fiz. (USSR)*, vol.36, no.5, p.155-7 (5 Sept. 1982). [received: April 1983]

The effect of a longitudinal magnetic field on the circular polarization of recombination photoluminescence of hot electrons is observed. This effect is related to the change in the mutual orientation of correlated momenta and spins of photoexcited electrons. (3 refs.)

63041 Radiationless transitions in p-terphenyl crystals doped with anthracene, tetracene and pentacene. J.O.Williams, A.C.Jones, M.J.Davies (Edward Davies Chem. Labs., Univ. Coll. of Wales, Aberystwyth, Wales).

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.2, p.263-9 (Feb. 1983).

The fluorescence spectra and lifetimes of anthracene, tetracene and pentacene molecules in a host p-terphenyl single crystalline lattice have been measured over the temperature range 10-300K. At low temperatures the molecules occupy different sites in the host lattice. The high-temperature fluorescence spectra are dominated by particular sites and the temperature dependence of the fluorescence lifetime of these sites is recorded. Neither O_4/O_3 sites for anthracene nor A_3/A_4 sites for tetracene exhibit a marked temperature dependence whereas the lifetime of O_1/O_2 sites for pentacene decreases with increasing temperature with an activation energy of 60-90 cm^{-1} . This temperature dependence is associated with an increased probability for intersystem crossings from O_1/O_2 to a triplet level (T_2) of the pentacene molecule which is located at $16960 \pm 15 \text{ cm}^{-1}$. (21 refs.)

63042 Luminescence analysis of group III and V impurities in silicon. A.S.Kaminskii, L.I.Kolesnik, B.M.Leiferov, Ya.E.Pokrovskii.

J. Appl. Spectrosc. (USA), vol.36, no.5, p.516-20 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.745-50 (May 1982). [received: Feb. 1983]

Describes a method for carrying out a qualitative and quantitative analysis of group III and V impurities in silicon. The analysis of the content group III and V impurities is based on the characteristic emission, arising with recombination of multiparticle exciton-impurity complexes (MEIC) at low temperatures ($\sim 4\text{K}$). Recombination of such complexes can occur both without the participation of phonons and with the participation of TA, LO and TO phonons. The identification of the nature of an impurity is based on the fact that the luminescence spectra consist of a series of narrow lines, characteristic of each of the group III and V impurities in silicon. The systems looked at were: Si:P, Si:As, Si:Sb, Si:Bi, Si:Al and Si:Ga. (5 refs.)

63043 Spectral-kinetic study of the intrinsic-luminescence characteristics of a fluorite-type crystal. N.N.Ershov, N.G.Zakharov, P.A.Rodnyi.

Opt. & Spectrosc. (USA), vol.53, no.1, p.51-4 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.89-93 (July 1982). [received: April 1983]

A spectral-kinetic study has been conducted on the luminescent properties of CaF_2 , SrF_2 , and BaF_2 crystals under conditions of brief (10 or 20 nsec) X-ray excitation. The fundamental parameters of the short and long components of the intrinsic luminescence of the crystals have been determined in the temperature range from 77 to 400K. It was found that the characteristic

long-lived component of the luminescence is well described by a model of recombination of F and H pairs, while the short-lived component is of the $V_k + e^-$ exciton type. (23 refs.)

63044 Optical spectra of impurity centers with double-well adiabatic potentials. S.A.Kulagin, I.S.Osadko.

Opt. & Spectrosc. (USA), vol.53, no.1, p.100-1 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.169-71 (July 1982). [received: April 1983]

The optical spectra of polyatomic organic molecules dissolved in n paraffins frequently have a multiplet structure. Discussing the nature of the multiplet, Shpol'skii proposed that the multiplet lines correspond to spatially separated impurity centers. Later the existence of inverse variations in multiplet lines under the action of laser light was discovered which contradicted Shpol'skii's hypothesis. It was thus proposed that some lines in such multiplets could correspond to impurity centers with double-well adiabatic potentials. On the basis of numerical calculations the authors discuss the differences between doublet spectra of a two-well nature and doublets produced by spatially separated centers. (7 refs.)

63045 Luminescence flash photostimulation spectra of silver chloride.

A.N.Latyshchev, M.A.Kushnir, V.V.Bokarev.

Opt. & Spectrosc. (USA), vol.53, no.2, p.215-16 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.364-6 (Aug. 1982). [received: April 1983]

The results obtained indicate primarily that the initial result of the action of light on AgCl crystals is an increase in the concentration of deep electron traps (with ionization energies above 1.3 eV), which have a large effective cross section of light absorption and a decrease in the concentration of comparatively shallow traps. Even more striking are the changes taking place in the effective cross section of the traps. In comparatively shallow traps (< 1.2 eV), the effective cross section decreases, and in deep ones it increases sharply (threefold for 1.77 eV). This indicates a qualitative difference and a great variety of electron localization centers. (8 refs.)

63046 Absorption, fluorescence, and excitation spectra of thallium-activated rubidium bromide. V.B.Sharan (Dept. of Appl. Sci. & Humanities, Technol. Faculty, Kaila Nehru Inst. of Sci. & Technol., Sultanpur, USSR).

Phys. Status Solidi b (Germany), vol.116, no.1, p.41-7 (1 March 1983).

Absorption, excitation, and fluorescence spectra of polycrystalline RbBr:TI phosphors are presented at various thallium concentrations. For very low thallium content two absorption bands are obtained peaking at 224 and 260 nm. Additional absorption bands appear around 230, 244, 267, and 278 nm with rise of thallium content. An asymmetric fluorescence band in the ultraviolet region is obtained at low thallium concentration which can be resolved into two Gaussian emission bands peaking at 317 and 365 nm. Two additional visible fluorescence bands appear at 440 and 535 nm with rise of thallium content. The excitation spectra for the ultraviolet and visible emission bands are found to be different. Accordingly the ultraviolet emission band is attributed to the characteristic a-emission in TI^+ monomer entering substitutionally and the visible bands are attributed to dimer centers having D_{4h} site symmetry. (23 refs.)

63047 Theory of intrinsic recombination at zero temperature in small gap semiconductors. Estimations for PbSe. M.Mocker, M.Beiler (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany).

Phys. Status Solidi b (Germany), vol.116, no.1, p.205-15 (1 March 1983).

A theory of intrinsic recombination at zero temperature is developed. Numerical results in a wide range of excitation and doping concentrations are given for a model adapted to $\text{PbSe}_0\text{Se}_{0.9}$. In order that first-order Auger recombination is possible a minimum value of majority carrier concentration has to be reached. Consequently, a finite small signal lifetime only exists if doping concentration $N_D > N_{D\text{min}}$, where for $\text{PbSe}_0\text{Se}_{0.9}$ $N_{D\text{min}} \approx 4.5 \times 10^{18} \text{ cm}^{-3}$ in case of parabolic model and $N_{D\text{min}} \approx 9 \times 10^{19} \text{ cm}^{-3}$ in case of Kane model of band structure. Radiative recombination rate only depends on minority carrier concentration p. At strong excitation the radiative lifetime behaves like $p^{-2/3}$ in parabolic and like $p^{-1/3}$ in Kane band approximation. Quantum efficiency η of radiative processes in dependence on N_D decreases steeply near $N_D \approx N_{D\text{min}}$. (13 refs.)

63048 Orientation of polystyrene chains stretched above T_g as studied by fluorescence polarization. R.Fajolle, J.F.Tassin, P.Sergot, C.Pambrun, L.Monnerie (Lab. de Physicochimie Structurale et Macromoléculaire, Ecole Supérieure de Phys. et Chimie Industrielles de la Ville de Paris, Paris, France).

Polymer (GB), vol.24, no.4, p.379-82 (April 1983).

Fluorescence polarization has been used to measure the orientation of polystyrene chains labelled by an anthracene group covalently bound in the middle of the chains and dispersed in atactic uncrosslinked polystyrene. Stretching is performed at constant strain rate and various temperatures above T_g using equipment which is described. The influence of strain rate and temperature on chain orientation is reported and leads to the conclusion that the orientation of the central part of the labelled chains is not related to the complete stress but is governed by the rubbery deformation. The occurrence of relaxation phenomena during stretching is demonstrated. (11 refs.)

63049 Fluorescence probe for microenvironments: on the fluorescence properties of p-N,N-dialkylaminobenzylidenemalononitrile in polymer matrices. K.Y.Law (Xerox Webster Res. Center, Webster, NY, USA), R.O.Loutfy.

Polymer (GB), vol.24, no.4, p.439-42 (April 1983).

The effect of an alkyl group (R) in a series of poly(alkylmethacrylate) and poly(alkylacrylate) polymers on the fluorescence properties of p-N,N-dialkylaminobenzylidenemalononitrile derivative, 1, has been studied. The fluorescence emission maximum shifts to the blue and the fluorescence quantum yield decreases as the chain length of R increases. These results are interpreted in terms of a model which assumes that the location of 1 is dependent on R and the change in quantum yield reflects the difference in free volume of polymer chain flexibility in various locations in these polymers. (16 refs.)

63050 Inductive effect of substituents and their influence on the rate of temperature quenching of Eu^{3+} luminescence in mixed ligand europium β -diketonates. V.E.Karasyov, A.G.Mirochnick, R.N.Shchelokov (Inst. of Chem., Far East Sci. Centre, Acad. of Sci., Vladivostok, USSR).

Spectrosc. Lett. (USA), vol.15, no.12, p.931-43 (1982).

The authors' investigation deals with the effect of donor-acceptor activity of terminal groups of the organic ligand on radiationless dissipation of Eu^{3+} electronic excitation energy to the surrounding ligand. (16 refs.)

63051 Photoluminescence of epitaxial GaSb films and of GaInAsSb solid solutions. A.E.Bochkarev, L.I.Kolesnik, A.M.Loshinskii, M.G.Mil'vidskii (State Sci.-Res. & Design Inst. of Rare-Metal Industry, Moscow, USSR). *Sov. Phys.-Semicond. (USA)*, vol.16, no.10, p.1215-16 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1886-8 (Oct. 1982). [received: April 1983]
Epitaxial films of GaInAsSb solid solutions are the most promising materials for optoelectronic devices operating in the spectral range 1.7-3.2 μ . However, there is no published information on the luminescence properties of these semiconductors, although such properties determine largely the parameters of optoelectronic devices in which they are used. Therefore, the authors recorded not only the photoluminescence spectra of these solid solutions but also the corresponding spectrum of epitaxial films of gallium antimonide. (7 refs.)

63052 Photon transport of mobile nonequilibrium carriers in variable-gap semiconductors as a result of band-impurity level radiative recombination. G.V.Tsarenkov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Semicond. (USA)*, vol.16, no.10, p.1218-19 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1890-2 (Oct. 1982). [received: April 1983]
Considers theoretically photoluminescence in a variable gap semiconductor under band-impurity level radiative recombination conditions. (2 refs.)

63053 Edge photoluminescence of CdGa₂Se₄ single crystals. T.G.Kerimova, Sh.S.Mamedov, E.Yu.Salav (Inst. of Phys., Acad. of Sci., Baku, Azerbaijan SSR). *Sov. Phys.-Semicond. (USA)*, vol.16, no.10, p.1228 (Oct. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.10, p.1904-5 (Oct. 1982). [received: April 1983]
The authors investigated the photoluminescence spectra of CdGa₂Se₄ at 77 and 300K. Single crystals were prepared by the method of gas-transport reactions. Crystalline iodine was used to provide the transport gas. Single crystals prepared in this way were trihedral prisms with the [112] face most highly developed. The tetragonal c axis was inclined relative to the [112] direction by 37°. The photoluminescence was excited by an LPM-11 He-Cd laser ($\lambda=4416$ Å) and detected using an SPM-2 monochromator with a polarizer in front of the entry slit. The photoluminescence was emitted by the [112] face. (5 refs.)

63054 The influence of X-trap on spin-lattice relaxation in the impurity phosphorescent state of a naphthalene crystal. V.P.Vorob'ev, V.I.Mel'nik, M.T.Shpak. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.3, p.430-6 (March 1983). In Russian.
It is shown theoretically that a spin-lattice relaxation (SLR) process in the lowest triplet impurity state may be connected with a thermally activated electronic excitation energy exchange between the impurity and an X-trap accompanying it. On the basis of carried out experimental investigations concerned with the temperature and magnetic field effect on the impurity phosphorescence intensity it has been concluded that such SLR-process occurs in case of β -chloronaphthalene impurity in naphthalene-H₈ and deuterionaphthalenes 1DH₇, 2DH₇. 78.60 OTHER LUMINESCENCE SPECTRA AND RADIATIVE RECOMBINATION

(for photoconduction and photovoltaic effects, see 72.40; for photoluminescence, see 78.55)

63055 Emission of light from solids during crack formation. A.M.Avilov, V.D.Volovik, A.A.Evtukh, S.I.Ivanov (A.M. Gorkii State Univ., Khar'kov, Ukrainian SSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1271-2 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2071-3 (Oct. 1982). [received: April 1983]
Methods for recording weak light fluxes are used to study emission during cracking and destruction of glass, fused quartz, mica, and silicon and bismuth single crystals. Relative emission intensities are reported for various materials, in addition to the duration τ and intensity I of the light flashes during destruction of glass as functions of the diameter d of the rigid mounting (determining the sample bending) and the length l of the crack produced. Emission spectra were recorded at wavelengths 389-700 nm during destruction of photographic glass and mica. (9 refs.)

78.60F Electroluminescence

63056 Electroluminescence from ZnS during deformation of a metal contact. L.F.Gavrilov, F.F.Gavrilov (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.10, p.1284-5 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2093-4 (Oct. 1982). [received: April 1983]
Contact phenomena are important in understanding electroluminescence. It was shown by Lehmann (see J. Electrochem. Soc., vol.104, p.45, 1957) that many powdered phosphorescent crystals do not exhibit electroluminescence under ordinary conditions but do so when mechanically mixed with metal powders. The purpose of the present authors is to determine the electron-injecting properties of metal contacts. The sensitivity of a luminophor, activated by Ag and CuAl at four different concentrations, to deformations of the substrate in contact with the luminophor was tested. The luminophor was most sensitive to deformation at Cu and Al concentrations 6×10^{-2} and 9×10^{-2} wt.%. It is shown how the intensity of electroluminescence in the blue spectrum from a ZnS-CuAl luminophor behaves during deformation of zinc and copper contacts when a 10 kHz AC voltage of magnitude 150 V was applied to the capacitor plates. Aluminum and nickel contacts were also tested. The findings suggest the following interpretation of Lehmann's results on contact electroluminescence. Intense exoelectronic emission caused by large deformation of the particle faces may be responsible for the observed irregular emission from a mixture of luminophor and metal powder (particularly near the sharp faces of the metal particles). (6 refs.)

78.60H Cathodoluminescence, ionoluminescence

63057 Visible and near ultraviolet radiation from ultrathin silver films bombarded by low energy electrons. F.Miserey, A.Septier (Conservatoire Nat. des Arts et Metiers, Paris, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.5, p.321-4 (7 Feb. 1983). In French.
Ultrathin Ag films (thickness: 0.8-5 nm) deposited on Al substrate have been studied. The reflectance decreases in the energy range of surface plasmon excitation due to surface roughness. Measurements of radiation spectra produced by 12 keV incident electrons indicate that Ag transition radiation does appear when a single Ag monolayer is present on the substrate. Roughness-coupled surface plasmon radiation is also observed. (14 refs.)

63058 The low-energy-electron (LEE) excitation of SnO₂/Eu powder phosphor; fundamental characteristics. T.Matsuoka, T.Tohda, T.Nitta (Material Res. Lab., Matsushita Electric Industrial Co. Ltd., Osaka, Japan). *J. Electrochem. Soc. (USA)*, vol.130, no.2, p.417-23 (Feb. 1983).
The physicochemical properties and fundamental luminescent characteristics of SnO₂/Eu powder were examined for use as low-energy-electron (LEE) excitation phosphor. Solubility limit of Eu into SnO₂ was 0.05-0.06 a/o and smaller mean diameter, higher resistivity (order of 10¹⁰ Ω cm), and more intensive diffused reflectance were observed with increased Eu addition. Although the same emission spectra by f-f transition of Eu(⁵D₀-⁷F₁ strongest peaks) were observed in u.v., high and low-energy-electron excitation, broad intrinsic emission from SnO₂ matrix, which coexist with the f-f transition emission, was different for each excitation method. In LEE excitation, the maximum intensity wavelength of the intrinsic emission was longer than in high-energy-electron excitation. The intrinsic emission was not observed at room temperature in u.v. excitation. Excitation spectrum with a peak at 300 nm was attributed to matrix excitation, i.e. electron hole generation. Optimal addition of 0.1 a/o Eu for brightness, 5.9 msec decay (1/10), and an efficiency of 2 lm/W at 9~10V were observed under LEE excitation. Efficiency increased with lower voltage and current excitation due to sublinearities of brightness-voltage and current dependences. (22 refs.)

63059 Cathodoluminescence of some semiconductors and development of lasers with electron-beam excitation. L.N.Kurbatov, A.I.Dirochka, G.S.Kozina. *J. Appl. Spectrosc. (USA)*, vol.36, no.5, p.509-15 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.738-45 (May 1982). [received: Feb. 1983]
With a view to creating a sealed universal source of laser radiation for metrological purposes, the authors first investigate the cathodoluminescence of many semiconductors, and in particular Pb_{1-x}Sn_xTe and GaSe₂Te_{1-x}, and then present the generation spectra of a whole range of materials that can be used for electron-pumped semiconducting lasers. The materials looked at cover the laser range from the UV through the near-IR. (22 refs.)

63060 The excitation of energetic atomic particles penetrating amorphous condensed matter. W.Dziurda, L.Gabla, M.Tuleta (Inst. of Phys., Jagellonian Univ., Cracow, Poland). *Physica B & C (Netherlands)*, vol.115 B+C, no.3, p.419-25 (March 1983).
The emission of light from both the surface and the interior of a glass target bombarded by Ar⁺ ions of energy 2.5-5 keV was observed. The analysis of both kinds of radiation shows that excited Na atoms penetrating the glass undergo radiative relaxation. The relative number of Na atoms radiation inside the glass increases with increasing energy of incident ions. It was stated that the radiation of Na atoms penetrating the condensed matter was found when the NaCl single crystal was bombarded by the same ion beam. (8 refs.)

78.60K Thermoluminescence

- 63061 Thermoluminescence emission spectra of KCl-KBr mixed systems.** B.Subramanian, K.G.Bansigir (School of Studies in Phys., Jiwaji Univ., Gwalior, India). *J. Phys. C (GB)*, vol.16, no.10, p.1999-2003 (10 April 1983). Thermoluminescence (TL) emission spectra of gamma-irradiated KCl, KBr and KCl-KBr mixed crystals have been obtained at various glow peak temperatures. The variation of emission-band wavelength with composition at different glow peaks has been studied. It shows a minimum for the intermediate composition. Also, the addition of Br^- ions to the KCl lattice has more influence on the TL emission of a KCl-KBr mixed system than the addition of Cl^- ions to KBr. (11 refs.)
- 63062 On the role of Z centres in the supralinearity and sensitisation of LiF TLD phosphor.** V.K.Jain (Health Phys. Div., Bhabha Atomic Res. Centre, Bombay, India). *J. Phys. D (GB)*, vol.16, no.4, p.L89-91 (14 April 1983). A Z-centre model was proposed by Nink and Kos (1976) to explain the thermoluminescent response of LiF. That model has been criticised by several authors. A modified version of the Z-centre model has since been proposed. This letter points out that even the modified version does not stand scrutiny. (14 refs.)
- 63063 Thermoluminescence of low-temperature X-irradiated MgO and MgO:Li single crystals.** V.D.Rodriguez, V.M.Orea (Dept. de Fisica Fundamental, Univ. de Zaragoza, Zaragoza, Spain), Y.Chen, R.Alcala. *Phys. Status Solidi A (Germany)*, vol.75, no.2, p.577-82 (16 Feb. 1983). Thermoluminescence measurements of 80K X-irradiated MgO and MgO:Li single crystals are performed. In pure MgO four glow peaks, observed at 175, 220, 245, and 265K, are associated with the release of holes from different traps. All these glow peaks show two emission bands at 375 and 700 nm (the latter due to Cr^{3+} ions) while a band at 245 nm is found only in the 175K peak. In MgO:Li five glow peaks appear at 120, 135, 150, 165, and 220K, all of which are due to the recombination of holes with electron centers. The peak at 220K is correlated with the thermal destruction of $[\text{Li}]^{\circ}$ centers. Two emission bands, observed at 430 and 700 nm, are detected in all of the glow peaks. The activation energies for thermal ionization of the traps, which are related with the main glow peaks, are also given. (21 refs.)
- 63064 On mechanisms of thermostimulated luminescence excitation in γ -irradiated corundum.** A.L.Apanasenko, A.E.Ovechkin. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.3, p.354-7 (March 1983). In Russian. Thermostimulated conductivity (TSC), thermostimulated luminescence (TSL) and optical absorption of γ -irradiated $\alpha\text{-Al}_2\text{O}_3$ single crystals were investigated to determine the ways of charge transfer in TSL processes. It is found out that emission in the 3.0 eV region does not result directly from the current appearance. TSL in the regions of 3.8 eV and 1.8-2 eV is accompanied by appearance of free carriers in the allowed band. It is concluded that TSL processes in 3.0 eV region are due to transition inside complex centres. (5 refs.)

78.65 OPTICAL PROPERTIES OF THIN FILMS

- 63065 Electrical and optical properties of a-Si_{1-x}C_xH film prepared by GD SiH₄ and C₂H₄.** Chen Guanghua, Zhang Fangqing, Du Ning, Xu Xixiang, Huang Shisheng (Dept. of Phys., Lanzhou Univ., China), Liu Zhi. *Chin. J. Semicond.* (China), vol.4, no.2, p.149-53 (March 1983). In Chinese. Optical technology conditions, infrared absorption (IR) spectra, variation of optical gap (E_{opt}) with x, measurement results of ESCA and ESR of a-Si_{1-x}C_xH films prepared by glow-discharge decomposition of silane-ethane mixture have been studied. Preliminary discussions about these experimental results are presented. (8 refs.)
- 63066 Influence of Ag photodoping on photoinduced changes in As₂S₃ glass films.** T.Yaji, S.Kurita (Dept. of Electrical Engng., Keio Univ., Yokohama, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.3, p.400-3 (March 1983). The transient photoinduced optical absorption change (TOC) and the photodarkening have been studied in Ag photodoped As₂S₃ glass films. They were observed in all of the sample films we prepared ($(\text{As}_{0.4}\text{S}_{0.6})_{100-x}\text{Ag}_x$; $0 \leq x \leq 24.4$ at.%). For the photodarkening, the degree of the change in optical-gap energy due to the light irradiation and the heat treatment decreases with the increasing of Ag content. This may be ascribed to the fact that the motion of S atoms is hindered by the Ag atoms, causing a decrease in spatial flexibility. For the TOC, the spectral distribution of the optical absorption change has a broad peak. The peak center shifts to a lower energy position with the increasing of Ag content. (17 refs.)
- 63067 Optical anisotropy and electrostriction in the anodic oxide of molybdenum.** D.J.DeSmet (Dept. of Phys. & Astron., Univ. of Alabama, University, AL, USA), J.L.Ord. *J. Electrochem. Soc. (USA)*, vol.130, no.2, p.280-4 (Feb. 1983). The anodic oxidation of molybdenum in acetic acid electrolyte is studied using a self-nulling ellipsometer to follow field-induced changes in the optical properties of the oxide film. When oxidized at constant field, the oxide exhibits the greatest optical anisotropy of any oxide studied thus far. When the field is removed, the oxide retains more than half of its original anisotropy. The oxide film thickness increases when the field is applied, and the dependence of strain on field is linear at low fields. There is a corresponding decrease in the dielectric constant of the film when the film thickness increases. The zero-field optical anisotropy is not removed by an electrochromic conversion cycle. (12 refs.)

- 63068 Optical anisotropy and electrostriction in the anodic oxide of niobium.** C.G.Matthews, J.L.Ord, W.P.Wang (Dept. of Phys., Univ. of Waterloo, Waterloo, Ontario, Canada). *J. Electrochem. Soc. (USA)*, vol.130, no.2, p.285-90 (Feb. 1983). The anodic oxidation of niobium in sulfuric acid electrolyte is studied using a self-nulling ellipsometer to follow the optical changes that occur when the field in the oxide film is switched. The oxide is optically anisotropic with the anodizing field applied, and the degree of anisotropy, the ratio between index changes parallel and transverse to the field, is found to equal 2.2 by a procedure that requires consistency from the analysis of field-switching transients for a wide range of oxide film thicknesses. The film thickness increases and its refractive index values decrease when the field is applied. The dependences are not the parabolic dependences predicted by the theory of electrostriction, and the significance of this finding is discussed. Although the galvanostatic charge-discharge transients that are used to study the changes in the low frequency dielectric constant exhibit significant hysteresis, they show that the decrease in dielectric constant with increasing field observed at optical frequencies occurs also at low frequencies. The results are compared with the dependence of dielectric constant on field deduced from open-circuit transient analysis, and the significance of the discrepancy is discussed. It is concluded that the possibility that the oxide film has a significantly polar structure remains an open question. (16 refs.)
- 63069 Optical absorption in hydrogenated microcrystalline silicon.** Z.Iqbal, F.-A.Sarott, S.Veprek (Inst. of Inorganic Chem., Univ. of Zurich, Zurich, Switzerland). *J. Phys. C (GB)*, vol.16, no.10, p.2005-15 (10 April 1983). Optical absorption measurements between 0.35 and 2.5 eV at 22°C on hydrogenated microcrystalline silicon films prepared in a DC discharge at deposition temperatures (T_{dep}) between 110 and 450°C, are presented and discussed. Anomalous high optical-absorption was observed for films prepared at a floating potential, which is a few orders of magnitude higher than of single-crystal Si for samples prepared at T_{dep} between 260 and 350°C and in the photon energy range up to 2.0 eV, is also higher than that of amorphous Si. Samples prepared at a floating potential at $T_{\text{dep}} \leq 180^\circ\text{C}$ and $\geq 400^\circ\text{C}$, and those prepared at a negative substrate bias, show a lower optical absorption, which for the latter films is similar to that of amorphous silicon. Annealing up to 800°C under ultra-high vacuum resulted in a small but reproducible increase in absorption independent of T_{dep} . Similar annealing experiments followed by absorption measurements in high vacuum indicated no measurable effect of the adsorbed oxygen on the optical absorption. The angular dependence of the forward light scattering from the films was measured at various wavelengths and found to diffuse scattering and absorption in the films. Furthermore, quantitative estimates of the surface roughness of the films from reflection data and scanning electron micrographs were made, and these results are discussed with respect to the enhanced absorption and scattering in the films. (23 refs.)
- 63070 A numerical method for determining the complex refractive index from reflectance and transmittance of supported thin films.** R.T.Phillips (Cavendish Lab., Univ. of Cambridge, Cambridge, England). *J. Phys. D (GB)*, vol.16, no.4, p.489-97 (14 April 1983). It is known that several widely used methods of analysing reflectance (R) and transmittance (T) for a supported thin film neglect the effect of the rear surface of the substrate. Equations are given which relate R and T to the complex refractive index ($n-ik$) and thickness of the thin film, and a method for their solution is described. This relies on Powell's technique, and permits changes to be made to the equations relating R , T to ($n-ik$). This flexibility has allowed the calculation of the effect of the neglect of the rear of the substrate. An example is given of the use of the method for the determination of ($n-ik$) for an amorphous film of selenium, measured at 100K over the range of photon energies from 1.5 to 3.25 eV. (9 refs.)
- 63071 Molecular orientation in thin monolayer films by infrared spectroscopy.** J.F.Rabolt, F.C.Burns, N.E.Schlottter, J.D.Swales (IBM Res. Lab., San Jose, CA, USA). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.30, p.29-34 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). Fourier transform infrared spectroscopic measurements have been made on monolayer samples of cadmium arachidate in order to determine orientation and molecular packing on the surface. This was accomplished by using both grazing angle reflection methods, where the polarization of the infrared radiation is very close to being perpendicular to the surface, and transmission methods, where the incident optical electric field is polarized parallel to the surface. Hence these two methods are sensitive to molecular vibrations whose change in dipole moment lies along different directions. The results showed that independent of the substrate, silver for the reflection experiments and silver bromide for the transmission experiments, the chains of the fatty acid salt (no evidence for any free acid was found) are oriented within a few degrees of the normal to the surface of the substrate. From a detailed analysis of the observed vibrational bands in the two orientations, combined with the known literature values and assignments, the authors were able to make a 'complete assignment' of the observed bands. (12 refs.)
- 63072 Applications of surface polaritons for detection and vibrational spectral analysis of thin films on metals and dielectrics.** G.N.Zhizhin, M.A.Moskalova, E.A.Vinogradov, A.A.Sigarev, V.A.Yakovlev (Inst. of Spectroscopy, Acad. of Sci., Troitzk, USSR). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.30, p.35-40 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982). Phonon-polaritons interactions with molecular vibrations of thin films were used for the detection of film oscillator spectral positions. The gap in the polariton branch was proportional to \sqrt{l} being the thickness of the film on dielectric support. The ATR method in the Otto configuration was used for measurements as well as thermal stimulated emission. The vibrational spectra (infrared absorption) of monomolecular films were detected by surface electromagnetic waves (SEW)—surface plasmon-polaritons propagating along the metallic substrate. A comparison of the reflection-absorption method with the SEW broadband ($650\text{-}2500\text{ cm}^{-1}$) FT-IR method of thin films detection is made. The better sensitivity of the last one is shown. The prism, grating and edge methods of SEW excitations in IR are discussed. (37 refs.)
- 63073 Method of determining refractive-index dispersion of film coatings from transmission spectra.** G.V.Pantelev, M.G.Cherenkov, V.I.Yampolskii, V.N.Egorov. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.192-3 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.331-3 (Aug. 1982). [received: April 1983] A number of methods exist for finding the refractive index of films from the level of the extrema of reflection and transmission curves. In some cases the magnitude of refractive-index dispersion can be calculated from the transmission spectra. The authors consider the effect of refractive-index dispersion

of a film on the position of extreme points of the transmission curve. (6 refs.)

63074 Optical properties of oxide supermultilayer films. V.A.Kamin, M.V.Shilova. *Opt. & Spectrosc. (USA)*, vol.53, no.2, p.198-200 (Aug. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.2, p.339-42 (Aug. 1982). [received: April 1983]

Presents results of investigations into the optical transmission of supermultilayer films consisting of ~ 2 -1000 alternating layers of the dielectrics SiO and GeO. Measurement of the optical transmission of the supermultilayer dielectric films (SDF) was performed on an SF-26 spectrometer in the 300-800-nm wavelength range. The calculated thickness of the layers in the various samples came to ~ 1 -100 nm. The total thickness of the films was within the ~ 0.1 -10- μ m limits. (11 refs.)

63075 Optical and electrical properties of a-Si₁C_{1-x}H films prepared by glow discharge from SiH₄ and C₂H₄. Chen Guang-hua, Zhang Fang-qing, Du Ning, Wang Hui-sheng (Dept. of Phys., Lanzhou Univ., Lanzhou, China). *Sol. Energy Mater. (Netherlands)*, vol.7, no.4, p.413-20 (Jan.-Feb. 1983). Optical technology conditions, infrared absorption spectra, variation of optical gap (E_{opt}) with x , measurement results of ESCA and ESR of a-Si₁C_{1-x}H films prepared by glow-discharge decomposition of silane-ethene mixtures have been studied. Preliminary discussions about these experimental results have been made. (8 refs.)

63076 Fundamental reflectivity spectra of Cd₃As₂ thin films. K.Karnicka-Moscicka, A.Kisiel (Inst. of Phys., Jagellonian Univ., Krakow, Poland), L.Zdanowicz.

Thin Solid Films (Switzerland), vol.101, no.2, p.115-21 (11 March 1983). Fundamental reflectivity spectra of thin polycrystalline and amorphous thin Cd₃As₂ films are reported. The results for polycrystalline samples can be quantitatively explained in terms of reflecting surface roughness only. For amorphous films the most probable explanation is provided by variations in the short- and medium-range order. (15 refs.)

63077 Thin film absorption spectra of lower valent p block halides. A.J.Bruce, J.A.Duffy (Dept. of Chem., Univ. of Aberdeen, Aberdeen, Scotland).

Thin Solid Films (Switzerland), vol.101, no.2, p.179-92 (11 March 1983). Thin film absorption spectra (mainly in the UV region) of the halides of In⁺, Tl⁺, Sn²⁺, Pb²⁺, Sb³⁺ and Bi³⁺ are considered in the light of spectral data for these ions diluted in alkali halide crystals and other halide media. Assignments to $S_{0-1}P_1$, $S_{0-1}P_2$ and $S_{0-1}P_3$ transitions are made on the basis of plotting photon energy against the orbital expansion parameter h for the set of halides for each metal ion. The plots are required (i) to be linear, (ii) to have a similar slope to the corresponding plot for the A, B and C bands of dilute systems and (iii) to extrapolate to the photon energy of the free metal ion for $h=0$. The justification for adopting this ligand field approach, as opposed to an energy band approach, is discussed and it is decided that the effect of energy band formation upon the s-p energy separation in the metal ion is quite small. In many instances the photon energy in the binary halide is similar to that for the metal ion when diluted in halide media, e.g. the $S_{0-1}P_1$ energy in PbBr₂ is 3.98 eV whereas for Pb²⁺ in KBr it is 4.16 eV, suggesting that the effect of energy bands is more or less compensated for by the reduced electron donation from the smaller number of halide ions in the binary metal halides compared with that in the diluted halide media. (51 refs.)

63078 Transparent conductors—a status review. K.L.Chopra, S.Major, D.K.Pandya (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).

Thin Solid Films (Switzerland), vol.102, no.1, p.1-46 (8 April 1983). Non-stoichiometric and doped films of oxides of tin, indium, cadmium, zinc and their various alloys, deposited by numerous techniques, exhibit high transmittance in the visible spectral region, high reflectance in the IR region and nearly metallic conductivity. The electrical as well as the optical properties of these unusual materials can be tailored by controlling the deposition parameters. These transparent conductors have found major applications in a vast number of active and passive electronic and opto-electronic devices ranging from aircraft window heaters to charge-coupled imaging devices. In this status review the authors present a comprehensive and up-to-date description of the deposition techniques, electro-optical properties, solid state physics of the electron transport and optical effects and some applications of these transparent conductors. 78.70 OTHER INTERACTIONS OF MATTER WITH PARTICLES AND RADIATION

63079 Coherent emission by relativistic particles interacting with atomic rows during reflection from a crystal surface. V.I.Vit'ko, A.V.Voitsenya, S.V.Dyul'dya, N.N.Nasonov, V.V.Rozhkov (Physicotech. Inst., Acad. of Sci., Kharkov, Ukrainian SSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.399-400 (Aug. 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.921-3 (Aug. 1982). [received: April 1983]

A new type of bremsstrahlung—an emission by relativistic positrons which are reflected at small angles from a solid surface (reflection radiation) has been predicted. The analysis used the approximation of a continuous distribution of the atoms on the reflecting surface, which was assumed to coincide with an atomic plane. The authors show that the coherent interaction of particles with atomic rows on the surface of a single crystal results in fundamental changes in the spectral and polarization properties of reflection radiation at high frequencies. 63080 Positron lifetime measurement of plastically deformed iron single crystals. F.Kuramoto, Y.Aono, M.Takenaka, K.Kitajima (Res. Inst. for Appl. Mech., Kyushu Univ., Fukuoka, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.4, p.1098-101 (April 1983).

Positron lifetime measurement and analysis were made for pure iron single crystals plastically deformed at room temperature and 77K. Both second component I_2 (175 psec, dislocations and jogs) and third component I_3 (about 350 psec, vacancy clusters) in the specimen deformed at 77K were larger than those in the specimen deformed at room temperature. It must be concluded that jogs in the low temperature deformed specimen play an important role in positron trapping and also in production of vacancies. However, the jog number density estimated from the experiment is too high, which suggests that some modification in the model of positron trapping by jogs may be required. (3 refs.)

78.70D X-ray absorption and absorption edges

63081 Structure of bimetallic clusters. Extended X-ray absorption fine structure (EXAFS) studies of Ir-Rh clusters. G.Meitzner, G.H.Via, F.W.Lytle, J.H.Sinfelt (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA).

J. Chem. Phys. (USA), vol.78, no.5, p.2533-41 (1 March 1983).

The extended X-ray absorption fine structures (EXAFS) associated with the L_{III} absorption edge of iridium and the K absorption edge of rhodium were investigated for catalysts containing bimetallic clusters of these elements dispersed on silica or alumina. The catalysts contained 1 wt.% iridium and 0.5 wt.% rhodium, which corresponds to an Ir/Rh atomic ratio close to 1. From the EXAFS data, it is concluded that the rhodium concentration in the surface region of the iridium-rhodium clusters is greater than it is in the interior. The EXAFS data also indicate that the iridium-rhodium clusters are more highly dispersed on alumina than on silica. (24 refs.)

63082 Soft X-ray absorption spectroscopy by electric potential scanning application to carbon, nitrogen and oxygen K edges. T.Muranaka (Dept. of Appl. Phys., Tohoku Univ., Sendai, Japan).

J. Vac. Soc. Jpn. (Japan), vol.25, no.12, p.775-80 (1982). In Japanese.

Carbon, nitrogen and oxygen K-absorption spectroscopy by electric potential scanning has been demonstrated for polymer samples of collodion and formvar using a nickel X-ray target. Besides representing these obtained spectra, some experimental aspects including background features without sample films are described for technical convenience. In addition, a recently proposed numerical procedure is applied to some of the observed spectra to obtain characteristic absorption functions which are not influenced by the incident X-ray intensity distributions. (18 refs.)

63083 Extended X-ray absorption fine structure investigation of local symmetry changes in Co^{2+} - and Ni^{2+} -exchanged zirconium phosphates. L. Alagna, T. Prosperi, A.A.G. Tomlinson (Istituto di Teoria e Struttura Elettronica dei Composti di Coordinazione, Rome, Italy), C. Ferragina, A. La Ginester. *J. Chem. Soc. Faraday Trans. 1 (GB)*, vol.79, pt.4, p.1039-47 (April 1983). The EXAFS spectra of Co^{2+} - and Ni^{2+} -exchange zirconium phosphates (mainly the α -forms) have been measured using synchrotron radiation. The M-O bond distances obtained are correlated with geometries inferred from electronic spectra. It is confirmed that there are changes in site geometry with degree of loading and calcination temperature. There is also further support for the presence of distorted tetrahedral sites in the anhydrous layered α -forms. For all the materials, a second shell is visible between 2.4 and 2.87 Å (non-phase-shift corrected) depending on the particular material; these are ascribed to M...P distances. The gross changes in these second-shell distances, the M-O bond distances and the inter-layer distances are combined to suggest sites for the metal ions. As for the Cu^{2+} analogues, and the zirconium phosphate layers do not remain rigid after exchange and calcination, but side (and, perhaps, twist) to accommodate the Co^{2+} or Ni^{2+} . (28 refs.)

63084 X-ray studies of 3d-transition metals in compounds with chlorine and bromine. G.P. Polovina. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.3, p.422-6 (March 1983). In Russian. K-absorption spectra of Ni and Cu have been studied in NiCl_2 , NiF_2 , NiBr_2 , CuBr_2 as well as K-absorption spectra of Br—in CuBr_2 , ZnBr_2 , NiBr_2 , $\text{CoBr}_2 \cdot 6\text{H}_2\text{O}$ and the L_{α} -band of Cu—in CuBr . K- and L-spectra of CuCl were matched in a single energy scale in order to determine the nature of the 'white' line in the K-edge of Cl in the compound. The investigation shows that there is a 'white' line in K-edges of Cl and Br which corresponds to free 3d-states of the metal. Degrees of 3d electrons participation in the chemical bond are different for various halogens. (13 refs.)

63087 Excitation of surface electromagnetic waves at a solid surface by an intense laser beam. A.M. Prokhorov, V.A. Sychugov, A.V. Tishchenko, A.A. Khakimov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.8, p.415-16 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.961-6 (Aug. 1982). [received: April 1983]

Several recent studies of laser annealing and of the interaction of laser beams with matter have revealed the appearance of periodic structures of polished surfaces of various materials when bombarded by intense laser beams. Possibly, the wave incident on the surface interferes with a surface electromagnetic wave, which it excites, giving rise to the periodic structure. In an effort to identify the actual role played by surface electromagnetic waves in this process, the authors have analyzed the propagation of surface electromagnetic waves along a rippled interface between two media. A study of the nature of the damage caused to surfaces of various materials when bombarded by intense laser beams opens up some new possibilities for research on the materials themselves as well as some new possibilities for the technology of grating fabrication. 79.20F Electron impact: Auger emission

63088 Auger electron appearance potential spectrum of Ni. D.L. Grolemond, D. Chopra (Dept. of Phys., East Texas State Univ., Commerce, TX, USA).

IEEE Trans. Nucl. Sci. (USA), vol.30, no.2, p.934-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Electrons are accelerated onto a solid polycrystalline Ni surface. These primary electrons interact with the surface to produce one of two phenomena: X-ray fluorescence, or Auger electron emission. Auger electron appearance potential spectroscopy (AEAPS) is a process by which the Auger component of the secondary electron flux is analysed to extract qualitative information about the electronic structure of the empty conduction band states. In AEAPS, the threshold behavior of the Auger transitions is examined by taking the first derivative of the secondary electron current with respect to the incident electron energy using the potential modulation technique. Width of the empty band, degree of localization of the conduction band wave functions, overlapping of the 3d band with the 4s, and satellite phenomena are among the important parameters ascertainable by AEAPS. The present AEAPS measurements of L_{32} levels of Ni are compared with the reported data from Soft X-ray Appearance Potential Spectroscopy (SXAPS) of Ni. (16 refs.)

63089 Autoionization emission from transition metals by electron impact. S.D. Bader, G. Zajac, J. Zak (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).

Phys. Rev. Lett. (USA), vol.50, no.16, p.1211-14 (18 April 1983).

Intense gain satellites associated with the $M_{23}VV$ Auger transition have been observed for representative 3d transition metals. The satellites have line shapes and intensities that resemble those of the M_{23} electron-energy-loss and resonant photon-excited spectra of these materials and are identified as being due to autoionization electron emission. This identification satisfies the expectation that the Fano effect should be manifest in both absorption and emission experiments, whether photon or electron excited. (18 refs.)

63090 The depth dependence of the depth resolution in composition-depth profiling with Auger electron spectroscopy. M.P. Seah, C.P. Hunt (Div. of Materials Applications, NPL, Teddington, England).

Surf. & Interface Anal. (GB), vol.5, no.1, p.33-7 (Feb. 1983).

The depth dependence of the depth resolution in composition-depth profiles using Auger electron spectroscopy is briefly appraised to emphasize some of the different mechanisms operating for different classes of material and to show how the use of a characterized Ta_2O_5 on Ta reference material can help to optimize the depth resolution. In addition it is shown that, even for flat uniformly-layered samples sputtered under ideal conditions where the ion beam crater is flat and impurities may be ignored, five factors still limit the depth resolution: information depth, statistical effects and cascade mixing, electron stimulated desorption and sample roughening. These may each be observed to dominate at the appropriate depth for amorphous materials but, for evaporated polycrystalline metal films, the last term dominates for depths greater than 10 nm. (42 refs.)

79.20K Other electron impact phenomena

63091 Improvement of sensitivity of electron energy loss spectroscopy. A. Koma, K. Yoshimura (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan).

Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L173-5 (March 1983).

A new method has been developed to drastically increase the sensitivity of low-energy electron energy loss spectroscopy. This method uses a pulse counting technique to detect a small number of analysed electrons and a difference formula to obtain the second-derivative spectrum. A personal-computer-controlled system has been developed for this purpose and the usefulness of the present method is demonstrated. (2 refs.)

63092 Thermal scattering of slow electrons during elastic specular reflection from a Cu (001) surface. R.E. Dietz, E.G. McRae, D.A. Kapirow (Bell Labs., Murray Hill, NJ, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.41 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given as follows: The authors studied the effects of thermal scattering of slow electrons ($E < 20$ eV) specularly and elastically reflected from a Cu (001) surface at temperatures up to 1000K. These effects are important in surface spectroscopies that depend on conservation of momentum parallel to the surface. The structure in the reflected electron current as a function of electron energy near diffracted beam emergence thresholds are found to be sensitive to temperature. The overall specular current decreases sharply with increasing T, and the current in the peaks close to threshold diminishes relative to the current in the lowest energy peak with increasing T and with decreasing polar angle of incidence. The authors fitted the observed lineshapes in I vs. E plots with a calculation which takes

account of (a) multiple scattering between the substrate and the surface potential barrier (SPB) modelled by a saturated image potential; (b) thermal diffuse scattering (TDS) at the substrate; and (c) electron energy loss due to electron-electron interactions as represented by a short-range imaginary potential. The TDS is taken to zeroth order for direct (Bragg) reflection, and to second order in the transferred momentum for indirect reflection wherein the electron is momentarily trapped by the SPB. The mean-square amplitudes of vibration perpendicular and parallel to the surface are taken as parameters, and values slightly larger than bulk values are found to satisfy the data. (2 refs.)

63093 High resolution electron energy loss studies of adsorbates utilizing impact and resonance scattering. J.E.Demuth (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), P.A. Vouris, D.Schmeisser.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.163-74 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The nonpolar electron scattering processes of impact and resonance scattering from adsorbed molecules are discussed. Examples of O_2 , H_2 , benzene, pyridine and cyclohexane adsorption on Ag(111) are presented to illustrate the potential of nonpolar scattering to provide new physical information regarding adsorption and surface reactions. (22 refs.)

63094 High resolution EELS studies of clean and oxide covered semiconductor surfaces. L.H.Dubois, G.P.Schwartz (Bell Labs., Murray Hill, NJ, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.175-80 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

High resolution electron energy loss spectroscopy was used to study surface optical phonons on sputter-annealed samples of GaAs, InP, GaP, and CdTe. The measured phonon frequencies were in excellent agreement with theoretical predictions and were independent of crystal orientation, bulk doping level or method of surface preparation. Coupled plasmon-phonon modes in degenerately doped samples were observed to be weak or totally suppressed, suggesting that surface carrier depletion has occurred. Vibrational spectra have also been obtained from thermally grown native oxides on InP and GaP which support the existence of the respective orthophosphates $InPO_4$ and $GaPO_4$. (16 refs.)

63095 Summary abstract: vibrational excitations of hydrogen and oxygen on Pd(100). C.Nyberg, C.G.Tengst (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.191-2 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given. The adsorption and coadsorption of hydrogen and oxygen on the Pd(100) surface have been studied using angle resolved high resolution electron energy loss spectroscopy (EELS) and low energy electron diffraction (LEED). The coadsorption of hydrogen and oxygen can give important information relevant to the catalytic oxidation of hydrogen on Pd. The Pd(100)p(2×2)O surface does not adsorb hydrogen at 80K, while oxygen adsorbs both dissociatively and associatively on the Pd(100)c(2×2)H surface at 80K. To study the changes in the coadsorbed overlayer as the temperature is increased up to the point where the water reaction occurs, the sample was exposed to 0.5 L oxygen followed by 5 L hydrogen at 80K. No ordering could be observed with LEED. The EEL spectrum not only reveals losses characteristic of atomic oxygen and hydrogen adsorbed in the hollow site but also a loss at 37 meV. The nature of this loss is not yet fully understood. It may be due to the vibration of oxygen atoms adsorbed in the vicinity of hydrogen atoms. Another possibility is that hydroxyl is formed during the adsorption, the 37 meV loss being due to the Pd-OH stretch vibration or the Pd-OH bend vibration. This would, however, give rise to a loss corresponding to the O-H stretch vibration. No loss is found in this region of the spectrum. Heating the sample to 275K causes the 37 meV peak to disappear. The LEED pattern reveals a sharp p(2×2) structure. This means that the oxygen and hydrogen atoms have redistributed on the surface, without any apparent water formation taking place as observed with the mass spectrometer. Finally, when the sample is heated to 300K water is formed and desorbs from the surface. (3 refs.)

63096 High resolution electron energy loss spectroscopic study of the interaction of oxygen with magnesium single crystal surfaces. P.A.Thiry, J.Ghijssen, J.Pireaux, R.Caudano (Lab. de Spectroscopie Electronique, IRIS, FNDP, Namur, Belgium).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.193-8 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

From the beginning of the interaction of oxygen with the clean Mg(0001) and Mg(1100) surfaces, two vibrational bands were measured by HREELS. The first one at 480 cm^{-1} is attributed to atomic oxygen adsorbed at the surface. The second band at 620 cm^{-1} is related to the stretching vibration of incorporated oxygen precursor to oxide formation. No specific difference was observed in the position and evolution of the two bands for both surfaces, but the electronic intensity reflected in the specular peak exhibited a totally different behaviour. The widths of the vibrational bands suggest a strong coupling with the continuum of electron-hole pairs of the metal. (9 refs.)

63097 Oxygen adsorption on the kinked Pt(321) surface. M.R.McClellan (Dept. of Chem., MIT, Cambridge, MA, USA), J.L.Gland, F.R.McFeely.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.213-18 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Oxygen adsorption and desorption were characterized on the kinked Pt(321) surface using high resolution electron energy loss spectroscopy and thermal desorption spectroscopy. Molecular oxygen adsorbs mainly as a peroxo-like species at 100K with a heat of desorption of about 22 kJ/mol . Some of the molecular oxygen also adsorbs dissociatively at 100K. Atomic oxygen is adsorbed in three states. One state is due to adsorption on the terraces and another state is due to adsorption along the rough step sites. The heat of desorption of both of these states is approximately equal and decreases from 290 kJ/mol to 195 kJ/mol with increasing coverage. Atomic oxygen is also observed to adsorb in another state which is interpreted as adsorption at an on-top site. (8 refs.)

63098 Calculation of the EELS spectra of the Ni(001) surface with p(2×2) and c(2×2) overlayers of oxygen. V.Bortolani (Istituto di Fisica, Univ. di Modena, Modena, Italy), A.Franchini, F.Nizzoli, G.Santoro.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.219-24 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The authors present a force constant slab calculation of the nickel (001) surface phonons with p(2×2) and c(2×2) oxygen overlayers. According to very recent experimental results they assume in both configurations an equal distance of 0.9 Å between the oxygen overlayer and the nickel surface. With

two adjustable parameters (the O-Ni force constants) they are able to reproduce with good accuracy the position and the lineshape of four peaks present in the experimental EELS spectra. The nature of these peaks is investigated in detail and the noticeable difference between the spectra of the two overlayers is explained. (15 refs.)

63099 Contrasting bonding configurations of acetone on Pt(111) and Ru(001) surfaces. N.R.Avery, A.B.Anton, B.H.Toby, W.H.Weinberg (CSIRO Div. of Materials Sci., Univ. of Melbourne, Parkville, Victoria, Australia).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.233-7 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The comparative chemistry of acetone adsorption on Pt(111) and Ru(001) has been studied by EELS. On the more easily oxidized Ru(001) surface, acetone bonded in a side-on, $\eta^2(\text{O,C})$ configuration, whereas on the well-defined, close-packed regions of the Pt(111) surface acetone adopted a weak adduct-like, end-on, $\eta^1(\text{O})$ configuration. On Pt(111), some $\eta^2(\text{O,C})$ was also observed and associated with adsorption at low coordination accidental step sites. (10 refs.)

63100 The methoxy intermediate on Mo(100): effects of surface oxidation. S.L.Miles (Dept. of Chem., Princeton Univ., Princeton, NJ, USA), S.L.Bernasek, J.L.Gland.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.239-46 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Methanol adsorption and decomposition were characterized on clean, partially oxidized, and completely oxidized molybdenum (100) surfaces using high resolution electron energy loss spectroscopy and temperature programmed reaction spectroscopy. A methoxy intermediate was found on both the clean and partially oxidized surfaces but not on the completely oxidized surface. The adsorbed methoxy was bound more stably to the clean surface than to the partially oxidized surface. Molecular methanol adsorption was dominant on the completely oxidized surface. Surface passivation correlated directly with the degree of surface oxidation for methanol decomposition on the Mo(100) surface. (22 refs.)

63101 HREELS studies of adsorbates on polar solids: water on SrTiO₃(100). P.A.Cox, R.G.Egdell, P.D.Naylor (Inorganic Chem. Lab., Univ. of Oxford, Oxford, England).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.247-52 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The adsorption of water on SrTiO₃(100) has been studied by HREELS. Exposure of the defect free surface to water at 100K leads initially to nondissociative adsorption on surface cation sites with development of losses due to O-H stretching and bending modes at frequencies similar to those of free H₂O. Further exposure results in progressive attenuation of the surface phonon losses of the substrate with development of a loss spectrum characteristic of an ice multilayer. Binding of water in oxygen vacancy sites generated by argon ion etching is much stronger than to the defect free surface. (11 refs.)

63102 A vibrational study of ammonia chemisorbed on Ni(110) and Ni(111): whether goes the metal-nitrogen stretching mode on FCC (111) surfaces? G.B.Fisher, G.E.Mitchell (Phys. Chem. Dept., General Motors Res. Labs., Warren, MI, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.253-9 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The adsorption of ammonia on the Ni(110) and Ni(111) surfaces has been studied with high resolution ($\leq 65\text{ meV}$) electron energy loss spectroscopy (EELS) combined with thermal desorption spectroscopy. The EELS spectra of the initial chemisorbed layer of a state on each surface are very different. Ammonia chemisorbed on the Ni(110) surface exhibits a strong Ni-N stretching mode at 570 cm^{-1} which is absent on the Ni(111) surface. The ammonia adsorption site appears to be different on the Ni(110) and Ni(111) surfaces. The authors suggest that the absence of the M-N stretching mode on the Ni(111) surface is a general characteristic of the ammonia adsorption site on the (111) surfaces of FCC Group VIII metals. (20 refs.)

63103 The adsorption of NO on Ru(001) and its co-adsorption with oxygen studied by vibrational spectroscopy. W.Stenzel, H.Conrad, B.E.Hayden, K.Kretschmar, A.M.Bradshaw (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.261 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The adsorption of NO on Ru(001), and its co-adsorption with oxygen, has been studied by LEED, TPD, EELS and IRAS (with particular emphasis on the vibrational spectroscopies) over a wide range of temperatures. The adsorption of NO on Ru(001) at room temperature is initially dissociative with molecular adsorption taking place only after a dissociative layer is formed. The authors study the effect of oxygen co-adsorption on the adsorption of NO under well defined conditions. The dissociation layer is characterized by a (2×2) LEED structure and is found to influence the subsequent molecular adsorption of NO in exactly the same way as a saturated, pre-chemisorbed layer of oxygen. One effect of oxygen co-adsorption is to suppress the ν_1 intensity in the desorption spectra (the ν_2 peak remains essentially unchanged), while simultaneously producing a new TPD peak of NO ($\nu_1(\text{O})$) with lower binding energy. In the corresponding EELS spectra these two species (ν_1 and $\nu_1(\text{O})$) are clearly distinguished. The adsorption of NO at low temperature ($\sim 95\text{ K}$) initially produces a species of NO with an N-O stretch frequency of 1400 cm^{-1} . This is the only species observed up to an exposure of 0.5 Langmuirs, and on warming to room temperature it dissociates completely to produce the (2×2) pattern described above. Pre-adsorption of oxygen prevents the formation of this species of NO. Only subsequent to the saturation of this species during adsorption at low temperature do two bands at $\sim 1490\text{ cm}^{-1}$ and $\sim 1810\text{ cm}^{-1}$, associated with the ν_1 and ν_2 molecular species, appear. The authors suggest that the low temperature, low coverage species is lying down, and the molecular species ν_1 and ν_2 are both adsorbed on 'on top' sites but corresponding to the bent and linear forms of the NO molecule, respectively. (2 refs.)

63104 The adsorption of ammonia on a Fe(110) single crystal surface studied by high resolution electron energy loss spectroscopy (EELS). W.Erley, H.Ibach (IGV/KFA Julich, Julich, Germany).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.263 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

EELS spectra of ammonia adsorbed on a Fe(110) single crystal surface at 120K reveal four different molecular adsorption states: 1. At very low exposures (0.05 L) three vibrational losses at 345 cm^{-1} , 1170 cm^{-1} and 3310 cm^{-1} are observed which are attributed to the symmetric Fe-N stretching, N-H₂ deformation and N-H₂ stretching modes of chemisorbed molecular

ammonia, respectively. 2. Further exposures up to 0.5 L cause the appearance of additional losses at 1450 cm^{-1} , 1640 cm^{-1} and 3370 cm^{-1} . The latter two are interpreted as the degenerate NH_3 deformation and stretching modes of molecularly adsorbed NH_3 . The 1450 cm^{-1} loss is a combination of the losses at 345 cm^{-1} and 1105 cm^{-1} . 3. In the exposure range from 0.5 to 2 L adsorption of molecular ammonia in a second layer is observed. This phase is characterized by a symmetric deformation mode at 1190 cm^{-1} and by two additional very intense modes at 160 cm^{-1} and 350 cm^{-1} which are due to rotational and translational modes. 4. Exposures above 2 L cause multilayer condensation of ammonia characterized by translational and rotational bands at 190 cm^{-1} , 415 cm^{-1} and 520 cm^{-1} , and a symmetric deformation mode at 1090 cm^{-1} . A broad loss feature around 3300 cm^{-1} is attributed to hydrogen bonding in the condensed layer. Thermal processing of an Fe(110) surface ammonia covered at 120K leads to decomposition of the ammonia into hydrogen and nitrogen above 260K. No vibrational modes due to adsorbed NH or HN_2 species were detected. (no refs.)

63105 Spatial intensity distributions from electron impact scattering modes: $\text{W}(100)(1\times 1)\text{H}$. S.R. Bare, P. Hofmann, M. Surman, D.A. King (Donnan Labs., Univ. of Liverpool, Liverpool, England).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.265-72 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The detailed mechanism of electron energy loss vibrational spectroscopy has been examined by recording a large data base of spectra with the detector moved both in and out of the incidence plane, for saturation coverage of atomic H adsorbed on $\text{W}(100)$ at 300K. In agreement with earlier work the authors find only a single electron loss (130 meV) in the specular direction, while away from the specular direction additional losses at 80 meV and 160 meV appear. These losses correspond to the symmetric stretching, the wagging and the asymmetric stretching modes respectively of H atoms occupying a C_{2v} bridge site. Large intensity variations of all these modes are found in backscattering directions and out of the incidence plane, in general agreement with recent theoretical predictions. The usefulness of these spatial intensity variations in adsorbate structure determination is discussed. The signal enhancement with electron collection in the plane orthogonal to the incidence plane may allow the observation of otherwise weak impact modes. (6 refs.)

63106 Identification of surface vibrations on clean and oxygen covered Pt(111) surfaces with high resolution electron energy loss spectroscopy (EELS). J.A. Schaefer, W. Gopel (Phys. Dept., Montana State Univ., Bozeman, MT, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.279-85 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Clean and oxygen covered (111) recrystallized Pt surfaces were studied by EELS after surface preparation at $150\leq T\leq 1650\text{K}$. The clean surface shows Stokes as well as antiStokes lines of surface phonons at $\pm 195^{-1}$. Adsorption of small amounts of ($<10^{-2}$ monolayers) of O_2 or H_2 leads to substrate-derived phonon losses at $\pm 380\text{ cm}^{-1}$. Oxygen exposure at different pressures, times and temperatures leads to atomic and/or molecular adsorption as well as oxide-related features which have been identified by EELS. (13 refs.)

63107 Electronic transitions of Ar, Xe, N_2 , CO physisorbed on Ag (111) and Al (111). D. Schmeisser (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany), J.E. Demuth.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.313 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

High resolution electron energy loss spectroscopy has been extended to study also the excitonic (low lying electronic) transitions of physisorbed rare gas atoms (Ar, Xe) and diatomic molecules (N_2 , CO) on Ag (111) and Al (111) surfaces at $\sim 20\text{K}$. Electron loss spectra were performed using a pair of hemispherical analyzers mounted at a fixed scattering angle (90°). This spectrometer allowed high transmission in the range of 0-15 eV loss energies and incident beam energies up to 20 eV. AES, LEED and UV Photoemission (HeI) were also used in situ to characterize these surfaces and to identify the adsorbed gases and delineate their absolute coverage regimes. (2 refs.)

63108 Vibrational spectra of ethylene and acetylene on metal surfaces—an electron energy loss study of ethylene adsorbed on Ni (110) and its carbided surface, and the use of metal-cluster analogies. C.E. Anson, B.J. Bandy, M.A. Chesters, B. Keiller, I.A. Oxtan, N. Sheppard (School of Chem. Sci., Univ. of East Anglia, Norwich, England).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.315-16 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

An analysis has been made of on- and off-specular electron energy loss spectra (EELS) from C_2H_4 and C_2D_4 adsorbed on a clean Ni (110) and also a carbided Ni (110) surface. The carbided surface was prepared by heating the clean Ni surface in ethylene to 573K or above. EELS spectra were obtained using a Leybold-Heraeus spectrometer at a beam energy of 3.0 eV and with a resolution of ca. 6.5 meV (ca. 50 cm^{-1}). (12 refs.)

63109 Azimuthal dependence of impact scattering in electron energy loss spectroscopy. B.M. Davies, J.L. Erskine (Dept. of Phys., Univ. of Texas, Austin, TX, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.323-8 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The azimuthal dependence of electron energy loss spectroscopy (EELS) dipole and impact scattering intensity has been measured. Spectra for a saturation coverage of H adsorbed on $\text{W}(110)$ exhibit loss peaks due to impact scattering from adsorbate vibrational modes. The intensity of the 160 meV loss peak has been measured as a function of the azimuthal angle between the scattering plane and a mirror plane of the surface. The angular pattern has strong maxima oriented perpendicular to the (111) rows of atoms on the surface, and has the C_{2v} symmetry of the $\text{W}(110)$ surface. This azimuthal dependence is strikingly different from the nearly isotropic angular dependence of dipole scattering from Cl adsorbed on $\text{W}(110)$. Selection rules for impact scattering account for the general features of the angular pattern based on asymmetric stretch modes associated with bridge site H atoms. (9 refs.)

63110 Wavenumber-resolved energy-loss spectra of Co_2Sm . P. Schattschneider, J. Fidler, V. Chopov (Inst. of Appl. & Tech. Phys., Tech. Univ. of Vienna, Vienna, Austria).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.31, no.1, p.25-32 (April 1983).

Wavenumber-resolved spectra of Co_2Sm have been obtained by electron energy-loss spectroscopy using 40 kV electrons in the diffraction mode. Four losses are found between 15 and 22 eV which are identified as a volume plasma loss of Co_2Sm (15.3 eV), plasma losses modified by carbon contamination (17.3 and 20 eV) and a plasma loss of Sm_2O_3 . The observed features are nondispersive within the surveyed q -space range ($0\leq q<0.5\text{ \AA}^{-1}$). An

interpretation in terms of a plasma loss hybridized by nonvertical interband transitions is proposed. (14 refs.)

63111 Relation between dynamical processes at surfaces and electron-energy-loss measurements. B.N.J. Persson (IBM Res. Center, Yorktown Heights, NY, USA).

Phys. Rev. Lett. (USA), vol.50, no.14, p.1089-91 (4 April 1983). The surface response function $d_1(\omega)$ (the frequency-dependent centroid of the induced charge density) determines the influence of a metal surface on all dynamical processes occurring well outside of it. It is shown that this function can be measured directly by use of electron-energy-loss spectroscopy. (11 refs.)

63112 Indirect determination of the single loss function from plural scattering data. M.E. Twigg (Dept. of Metall., Univ. of Illinois, Urbana, IL, USA).

Ultramicroscopy (Netherlands), vol.10, no.3, p.291-6 (1982).

Recent advances in electron energy loss spectroscopy (EELS) and scanning transmission electron microscopy (STEM) promise improved analysis of light elements. However, further efforts are limited by the fact that such low energy excitations as plasmons and interband transitions are influenced by complicated solid state effects rather than by the cores of isolated atoms. The author has investigated the role of plural scattering and has extracted the modified single loss function from empirical data using already established discrete Fourier transform techniques. In an alternate procedure, the author has constructed a plural loss function $\pi''(z)$ which lacks only the contribution of the single loss peak. This function was then subtracted from the plural loss spectrum in order to obtain the modified single loss function. Though slightly more involved than the earlier procedure, the indirect route leads to a significantly cleaner single loss function. (11 refs.)

63113 Electron capture and loss processes in heavy ion and molecular ion collisions with solids. R. Latz, J. Schader, H.J. Frischkorn, P. Koschar, K.O. Groeneveld (Inst. für Kernphys., Univ. Frankfurt, Frankfurt, Germany). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.913-15 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Angular (θ) and velocity (v_0) distributions of convoy electrons have been measured with monoatomic and molecular projectile ions (H^+ , D^+ , H_3^+ , D_2^+ , H_3^+ , He^+ , He^{2+} at 1.7 MeV/U and U^{28+} , Ti^{14+} at 1.4 MeV/U) as a function of the projectile dwell time t_D in carbon foils (2 to $50\text{ }\mu\text{g}/\text{cm}^2$). The spectra with light projectiles from carbon foils are compared with those of gaseous CH_4 targets. For the light and molecular projectiles the shapes and yield of convoy electrons depend strongly on the dwell time. A narrow, strongly θ -dependent contribution at $v_e=v_0$ can be distinguished from a θ -independent part at $v_e<v_0$ indicating different production mechanisms. A relation is presented which connects the yield of loss electrons from projectiles with the transmission of projectiles and electrons through solids. The yield of electrons in the spectrum for H_3^+ at $v_e=v_0$ and under zero degrees is found to be more than about 20 times as large as is expected from the contribution of loss electrons in last layer collisions. (8 refs.)

63114 Total yield and escape depth of electrons from heavy ion solid interactions. H.J. Frischkorn, P. Koschar, R. Latz, J. Schader, M. Burkhard, D. Hofmann, K.O. Groeneveld (Inst. für Kernphys., Univ. Frankfurt, Frankfurt, Germany).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.931-3 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

At high projectile energies ($\sim\text{MeV/U}$) several mechanisms for electron production are discussed as e.g. direct ionization collisions, recoil particle cascades, collective electron emission. Results are presented of total electron yield (γ) measurements over a wide projectile energy E_p range ($40\text{ keV/U}<E_p/M<12\text{ MeV/U}$) and a wide projectile Z_p range ($1<Z_p\leq 92$) of both monoatomic and molecular projectiles and of different target thicknesses. From the target thickness dependence of γ the mean free path λ of electrons in carbon can be calculated. The data are discussed in the frame of current theories. Significant deviations from calculated values and predicted dependencies are found, in particular for projectile velocities v_p close to the Fermi velocity v_F of target electrons and for molecular projectile ions. (16 refs.)

63115 A review of recoil ion physics. T.J. Gray, C.L. Cocke (Dept. of Phys., Kansas State Univ., Manhattan, KS, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.937-42 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

A review of recoil ion physics is presented. A brief history on the subject is introduced. The production of low velocity highly-charged recoil ions by fast heavy ion beams is discussed. Experiments which utilize the LEHQ beams to measure charge exchange cross sections and energy gain spectroscopy are discussed. (27 refs.)

63116 Scattering of neutral atoms by a periodic potential: the Morse corrugated potential. G.Armand (Service de Phys. des Atomes et des Surfaces, CENS, Gif-sur-Yvette, France), J.R.Manson. *J. Phys. (France)*, vol.44, no.4, p.473-87 (April 1983).

Within the two-potential formalism a general set of t matrix integral equations is obtained which describes the scattering of a neutral particle by a periodic potential. Furthermore a projection method is developed which allows one in the case of resonance to get a new set of equations in which the resonance singularities do not appear. This formalism is applied to the Morse corrugated potential. The integral equation set is solved by an interactive process and in this way an exact solution is obtained. The convergence of the iterative expansion is studied and an approximate convergence criterion is found. Results are compared with those given by an equivalent exponential corrugated potential which demonstrates the influence of the well and potential slope on the distribution of the intensities among the different diffracted beams. In order to have a precise determination of the corrugation function it is shown that it is necessary to use a realistic potential and also to avoid approximate methods for the calculation of intensities. (19 refs.)

63117 Z_1 dependence of equilibrium charge state distributions of MeV He ions emerging from solid. Y.Haruyama, Y.Kanamori, T.Kido, A.Itoh, F.Fukuzawa (Dept. of Nuclear Engng., Kyoto Univ., Kyoto, Japan). *J. Phys. B (GB)*, vol.16, no.7, p.1225-32 (14 April 1983).

The equilibrium charge state distributions of He ions emerging from various solid targets were measured in the energy range 0.6-2.4 MeV. Atomically clean target surfaces were prepared by continuous evaporation for Ga, Ge, Se and In, and by heating for Sc, Fe, Ta, W and Pt. The measured charge fractions F_i ($i=0, 1, 2$) were tabulated at 0.2 MeV intervals. In this energy range, the ratio F_1/F_2 is represented fairly well by the empirical formula $AE^{1/2}$, where E is the energy and A and B are target-dependent constants. The present data, together with the previous data, show clearly oscillatory behaviour of the equilibrium mean charge of He ions with target atomic number Z_1 . This oscillation is found to be attributed to the shell structure of the target atom. (19 refs.)

63118 Energy dissipation at metal surfaces: electronic versus vibrational excitations. K.Schonhammer (Inst. für Theoretische Phys., Univ. Hamburg, Hamburg, Germany), O.Gunnarsson.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.91-103 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

A theoretical description of the energy transfer between a surface and an atom or molecule approaching a surface is presented. Usually the excitation of substrate phonons by the impinging adsorbate is the dominating process. In the case of metal substrates, however, it has been realized that the excitation of electron-hole (e-h) pairs can lead to sticking coefficients or vibrational damping at surfaces of the same order as found experimentally. The authors focus on the description of the electronic excitations and compare their results with a very simple model of the phonon mechanism. The electronic mechanism turns out to be rather unimportant for the inelastic scattering of rare-gas atoms but cannot be neglected for light chemically reactive adsorbates. (29 refs.)

63119 The spectroscopy of surface vibrations by atom scattering. G.Benedek (Istituto di Fisica, Univ. Milano, Milano, Italy).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.71-86 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The recent progress in the production of highly monochromatic atomic beams is opening new perspectives in surface physics, having paved the way for a full determination of the surface vibrational structure. After a discussion on the possible determination of Rayleigh wave dispersion curves from angular distributions exploiting the kinematical focusing effect, a short review is presented on the direct measurement of surface phonon dispersion curves, first achieved by Brusdeylins et al. (1981) in alkali halides, from time-of-flight (TOF) spectra of scattered He atoms. A comparison is made with the existing theories of surface phonons in ionic crystals. The state of the art in the theory of inelastic processes is briefly illustrated in order to discuss the theoretical interpretation of TOF spectra. The one-phonon energy loss spectra of He scattering from LiF(001) calculated for a hard corrugated surface model are found to be in general good agreement with the experimental TOF spectra. From such a comparison evidence is obtained that: i) one-phonon processes are predominant, and ii) in addition to Rayleigh waves important contributions to the inelastic scattering come from the surface-projected density of bulk phonons. Important effects due to inelastic resonances with surface bound states are put in evidence and explained by simple kinematical arguments. The possible observation of surface optical modes in NaF(001) is finally discussed. (54 refs.)

63120 Internal state distributions of molecules scattering and desorbing from surfaces. D.J.Auerbach (IBM Res. Lab., San Jose, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.87-98 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Some recent applications of state specific detection techniques to studies of molecules interacting with surfaces are reviewed. The author concentrates on the direct inelastic scattering of NO from Ag(111). Coupling of translational to rotational motion is found to be a dominant energy transfer channel while vibrational excitation has a very small probability. Measured rotational state distributions exhibit several interesting features including rotational rainbows and rotational alignment. Quantum mechanical calculations on a simple model of the scattering provide a semi-quantitative description of the results and allow information on the interaction potentials to be derived. State specific measurements of molecules thermally desorbing from surfaces are also briefly discussed. (29 refs.)

63121 Hydrogen interactions with Ag(111): bound state scattering resonances and interaction potential determination. Chien-fan Yu, C.S.Hogg, S.J.Sibener (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.99-101 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given. The elastic and rotationally resolved inelastic scattering of H_2 , D_2 , and HD supersonic molecular beams from Ag(111) has been examined. These studies have been undertaken primarily for two reasons: to determine the laterally averaged isotropic and anisotropic components of the hydrogen/Ag(111) interaction potential, and to test the accuracy of different levels of quantum gas-surface scattering calculations. (6 refs.)

63122 Crystallographic determination of metal surfaces with helium scattering. N.Garcia (Dept. de Física Fundamental, Univ. Autónoma de Madrid, Madrid, Spain), A.Barker, I.P.Batra.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.137-44 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Helium-surface diffraction data has been used to construct the interaction potential between a helium atom and a metal surface. The constructed potential fits experimental data for all beam energies and angles of incidence and more importantly is independent of beam energy. Such a potential essentially consists of two parts: a short range repulsive corrugated potential due to electronic overlap, and a long range attractive potential due to dispersion forces. The authors have generated potentials for He scattering for Ni, Cu and Au and in all cases found excellent agreement with experiments. They also report that the repulsive part of the He scattering potential can be obtained rather simply from first principles without adjustable parameters. This suggests that one can determine surface crystallography from first principles without adjustable parameters. (14 refs.)

63123 Measurement of $Au(111)$ surface phonons by low energy helium scattering. M.Cates, D.R.Miller (Dept. of Appl. Mech. & Engng. Sci., Univ. of California, San Diego, La Jolla, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.30, p.157-62 (Feb. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Inelastic scattering of low energy helium atoms has been used to probe the surface phonon dispersion relation for $Au(111)$ along the (112) direction. The dominant scattering peak appears to be due to the Rayleigh surface mode with a measured speed of sound at low Q of ~ 1300 m/sec, bending over near the zone edge with a maximum ω of $\sim 11 \times 10^{12}$ sec $^{-1}$. Phonon scattering probabilities are given as a function of ω and fall off rapidly with ω . (10 refs.)

63124 The Ti KLL spectra of TiO_2 and $TiH_{1.64}$ generated by bremsstrahlung-excited Auger spectroscopy. T.N.Wittberg (Univ. of Dayton Res. Inst., Dayton, OH, USA), P.S.Wang.

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.31, no.1, p.81-3 (April 1983).

Recent studies have shown that excitation of Auger processes can result from the bremsstrahlung radiation which accompanies the characteristic radiation from magnesium and aluminium anodes. This effect has proved useful in studying a range of Auger transitions which are inaccessible to excitation by Al $K\alpha$ or Mg $K\alpha$ radiation. Bremsstrahlung excitation was used to study the Ti KLL Auger spectra of TiO_2 and $TiH_{1.64}$. The spectra were recorded using a modified AEI ES-100 spectrometer. The TiO_2 spectrum was recorded from a 100 nm thick anodic film which had been grown on polycrystalline titanium foil in an aqueous saturated solution of ammonium tetraborate. (10 refs.)

63125 The influence of the surface barrier on the trajectory of sputtered particles. T.G.Abdel-Malik, A.A.Aly, A.M.Abden, H.A.Motaweh (Dept. of Phys., Univ. of Tanta, Tanta, Egypt).

Phys. Status Solidi b (Germany), vol.116, no.1, p.169-72 (1 March 1983).

The parameters of a spherical surface barrier with refraction for the particles sputtered from Cu single crystals are computer calculated. Use is made of the method of straightforward simulation of the surface atom ejection in the field of the near-surface block of atoms. The interactions of the atoms are described by a Morse potential. (5 refs.)

63126 Molecular erosion of ice by keV ion bombardment. G.Ciavola, G.Foti, L.Torrisi (Inst. di Struttura della Materia, Univ. di Catania, Catania, Italy), V.Pirronello, G.Strazzulla.

Radiat. Eff. (GB), vol.65, no.1-4, p.167-72 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

High erosion has been detected during the bombardment of ice (H_2O and D_2O) at LN $_2$ temperature by helium and argon beams. In the range 20-100 keV, the erosion yield increases with the energy and mass of the impinging ions. The eroded particles have been analyzed by a quadrupole mass spectrometer and the main component is formed by H_2 (or D_2) H_2O (or D_2O) and O_2 molecules. (11 refs.)

63127 Characteristics of electrons emitted from aluminium, carbon and Mylar slabs irradiated by photons. M.Malbert, M.Terrissol, J.-P.Pataut (Centre de Phys. Atomique, Univ. Paul Sabatier, Toulouse, France), M.Angles. *Radiat. Prot. Dosim. (GB)*, vol.3, no.4, p.211-17 (1982).

The forward and backscattered electron fluence emitted by a slab under photon irradiation have been calculated using Monte-Carlo techniques for aluminium, carbon and mylar. The simulation methods used and the techniques chosen to study the low energy (<30 keV) electron transport are presented. The agreement with experimental and other theoretical results is good. (24 refs.)

63128 Low-energy (≤ 2 eV) electron escape depths of tetracene films. V.V.Grechov (Inst. of Phys. & Energetics, Acad. of Sci., Riga, Latvian SSR). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.2, p.237-42 (1 April 1983).

It has been shown that the real escape depth L of low-energy (≤ 2 eV) electrons determined in homogeneous tetracene films (obtained by vacuum evaporation on cooled substrate at 120K) does not exceed 6-10 Å. For much

small L values photoemission should be considered as essentially a surface phenomenon since the energy distribution of emitted photo-electrons substantially depends on energetic and structural peculiarities of the near-surface molecules of the crystal. (30 refs.)

63129 Ionization potentials and polarization energies of tetraselenafulvalene (TSF) derivatives determined from ultraviolet photoelectron spectroscopy. N.Sato, G.Saito, H.Inokuchi (Inst. for Molecular Sci., Okazaki, Japan). *Chem. Phys. (Netherlands)*, vol.76, no.1, p.79-88 (1 April 1983). Gaseous and solid-state ionization potentials of several derivatives of tetraselenafulvalene (TSF) and tetrathiafulvalene (TTF) have been determined from ultraviolet photoelectron spectroscopy. The first ionization potentials of the molecules in the gaseous state are appraised in terms of their molecular structures and the substitution effects. The characteristics in the electronic structure of these molecules as donors forming conductive salts with various acceptors are discussed. The polarization energies, obtained as the difference of the threshold ionization potentials for both states of these compounds, ≈ 1.4 eV, were a little smaller than the nearly constant value for polycyclic aromatic hydrocarbons, ≈ 1.7 eV. As the value of the polarization energy is determined mainly by the molecular polarizability and by the molecular packing density in the solid, the molecular polarizabilities of these compounds were estimated from the observed polarization energies, using a simplified relation. Such values are also useful in characterizing electronic states of the solids containing them. (34 refs.)

63130 3s multiplets in X-ray photoemission from layered magnetic intercalates. J.J.Barry, H.P.Hughes (Cavendish Lab., Univ. of Cambridge, Cambridge, England). *J. Phys. C (GB)*, vol.16, no.10, p.L275-8 (10 April 1983). The authors report X-ray photoemission measurements of the intercalant 3s core levels in the magnetic layer compounds $Mn_{1/3}NbS_2$ and $Fe_{1/3}NbS_2$. Multiplet splittings of 6.1 eV (Mn 3s) and 4.5 eV (Fe 3s) are observed, which suggest, in agreement with previous magnetic studies, that the intercalant ions adopt 2^+ ionisation states; there is some evidence for hybridisation of the intercalant 3d orbitals with orbitals on the surrounding atoms, particularly in $Fe_{1/3}NbS_2$. (16 refs.)

63131 Satellite structure of ZnO and Zn(II) halides studied by X-ray photoelectron spectroscopy. M.Scrocco (Lab. di Metodologie Avanzate Inorganiche, Univ. di Roma, Roma, Italy). *Phys. Status Solidi b (Germany)*, vol.116, no.1, p.137-44 (1 March 1983). The satellite structure in the X-ray photoelectron spectra of Zn(II) halides and ZnO is examined, particular attention being paid to the 3p, 3s metal subshells and the valence region. The nature of the phenomena giving rise to these satellites and their relative importance in each spectral region, is discussed with reference to known theoretical results. (21 refs.)

63132 Photoemission spectra and band structures of d-band metals. X. Relativistic momentum matrix elements. R.L.Benbow (Dept. of Phys., Northern Illinois Univ., DeKalb, IL, USA), N.V.Smith. *Phys. Rev. B (USA)*, vol.27, no.6, p.3144-51 (15 March 1983). For pt.IX see *ibid.*, vol.25, no.2, p.738 (1982). Band-structure calculations are performed to assess the magnitude of relativistic effects in angle-resolved photoemission. The specific case of normal emission from Ag(111) is considered using a combined interpolation scheme which incorporates spin-orbit coupling both within the d bands and between the plane waves of the basis set. Detailed numerical results are presented for the momentum matrix elements in the nonrelativistic and relativistic cases for all the initial-state bands in both parallel and perpendicular polarization. The observability of relativistic effects in available and future experimental data is discussed. (19 refs.)

63133 Surface-atom X-ray photoemission from clean metals: Cu, Ag, and Au. P.H.Citrin, G.K.Wertheim (Bell Labs., Murray Hill, NJ, USA), Y.Baer. *Phys. Rev. B (USA)*, vol.27, no.6, p.3160-75 (15 March 1983). Surface-atom core-level shifts from evaporated noble metals are reported using angle-dependent X-ray photoemission with monochromatized AlK α radiation. The absence of line broadening with increasing takeoff angle for the case of aluminum metal, where the surface shift is known to be small, confirms that the shifts observed in the noble metals are real surface phenomena. An analysis procedure is developed which establishes that the effect of the vacuum-solid interface in these systems is confined to the first atomic layer. The asymmetric (final-state-related) line shapes of the surface- and bulk-atom photopeaks are also shown to be identical within experimental error. The surface core-level shifts are 0.40 ± 0.02 eV for Au, -0.08 ± 0.03 eV for Ag, and -0.24 ± 0.02 eV for Cu, with the surface contributions occurring at lower electron binding energy. The analysis additionally yields electron mean free paths of 19 ± 3 Å at 1400 eV in Au and 14 ± 3 Å at 550 eV in Cu. Using the surface to bulk intensity ratios of the Au4f core levels, it was possible to isolate the contribution of the surface-atom valence electrons. The width of the surface density of states is narrowed ($\pm 2\%$) with respect to the bulk density of states and its center of gravity is shifted by 0.5 ± 0.1 eV. The analysis procedures and conclusions presented should be applicable to core and valence surface-atom photoemission from a wide variety of other systems. (29 refs.)

63134 Photoemission from surface-atom core levels, surface densities of states, and metal-atom clusters: a unified picture. P.H.Citrin, G.K.Wertheim (Bell-Labs., Murray Hill, NJ, USA). *Phys. Rev. B (USA)*, vol.27, no.6, p.3176-200 (15 March 1983). A model is presented which relates the observed narrowing and shifting of the surface density of states, reported in an earlier paper, with the sign and magnitude of the surface-atom core-level shift (SCS). This relationship, along with the identical line shapes observed for the bulk and surface-atom core-level photoemission peaks, is shown to provide strong support for a predominantly initial-state interpretation of the SCS. Inclusion of final-state screening energy differences between surface and bulk atoms is discussed within the framework of a more quantitative description of the SCS. General consideration of the effects responsible for the modified surface band structure, i.e. reduced coordination number and the resulting redistribution of charge between and within the s,p and d bands, allows the model to be extended to the transition metals and allows apparently different theoretical explanations of the SCS to be unified within a single picture. The special case of those rare-earth metals in which narrow corelevel f levels appear close to the Fermi energy is also discussed. Our previously described measurements and analytical procedures are compared with other recently reported surface atom core level studies, and all experimental results are compared with self-consistent and semiempirical thermodynamic calculations. Generally encouraging qualitative agreement is obtained, particularly the sign of the SCS which changes from element to element across the Periodic Table. Quantitative agreement is most lacking for the more-open single-crystal surfaces and for the metals near the ends of the transition series. Finally, the closely related photoemission experiments from small metal-atom clusters (akin to supported catalysts) have been reinterpreted. Consistency between these and the present results is obtained, provided that a proper reference level is employed. (103 refs.)

63135 Photoemission study of Au overlayers on Pd(111) and the formation of a Pd-Au(111) alloy surface. D.L.Weissman-Wenocur, P.M.Stefan, B.B.Pate, M.L.Sheik, I.Lindau, W.E.Spicer (Stanford Electronics Labs., Stanford Univ., Stanford, CA, USA). *Phys. Rev. B (USA)*, vol.27, no.6, p.3308-17 (15 March 1983). The techniques of photoemission spectroscopy (PES), Auger spectroscopy, and low-energy electron diffraction were used to examine the interaction of Au and Pd for the following: (1) overlayers of Au on Pd(111), ranging from 0.1 to 10 monolayers; (2) Au diffused into the Pd matrix; and (3) a stabilized Pd-Au alloy surface, formed by diffusing a thick Au layer into the Pd until the composition stabilized. An ordered Au(111) layer formed on the Pd. For the Au overlayers, three effects were seen by PES: (1) structures appeared which merged smoothly into the metallic Au structure; (2) structures at the energies of the clean Pd peaks were sharpened when submonolayers of Au were evaporated; and (3) a new structure appeared which could not be definitely attributed to Pd or Au. Au diffused into the Pd evidenced a more atomically structure than the overlayers. The stabilized alloy, which was determined to have 30 at.% Au in the surface region, evidenced PES structure strikingly similar to the 0.3 monolayer overlayer. Direct transition effects were seen for the alloy. The Au-derived structure was found to narrow and shift to slightly lower binding energy for the alloy as compared to the 0.3 monolayer overlayer. Comparison is made between the thin layers of Au on Pd and thin layers of Cu on Zn. Comparison is also made between the stabilized Pd-Au alloy and the Cu-Ni alloy system. Theoretical support for direct transitions in alloys is cited. (30 refs.)

63136 CO chemisorption on Fe(110) studied by angle-resolved photoemission. E.S.Jensen (Cornell Materials Sci. Center, Cornell Univ., Ithaca, NY, USA), T.N.Rhodin. *Phys. Rev. B (USA)*, vol.27, no.6, p.3338-50 (15 March 1983). An angle-resolved ultraviolet photoemission spectroscopy (UPS) investigation of CO chemisorbed on Fe(110) at 200K is presented. The binding energies at normal emission of the CO 3σ , 4σ , 5σ and 1π molecular orbitals are determined to be 27, 11.0, 8.3 and 6.8 eV, respectively, at saturation coverage. The 5σ binding energy is coverage dependent, decreasing to 7.6 eV at very low coverage. The identification of the 5σ and 1π peaks is made with the symmetry rules for normal-emission UPS. The variations of the 4σ , 5σ and 1π peak positions with the parallel component of electronic momentum are extensively investigated. The bandwidths observed are 0.3, 0.8, and <0.3 eV for the 4σ , 5σ , and 1π peaks, respectively, in the [001] mirror-plane direction. In the [110] direction, they are 0.2, 0.5, and <0.3 eV. Both the bandwidths and momentum dependences observed for the 4σ and 5σ peak positions are much more isotropic than can be accounted for by simple band dispersion for the highly anisotropic rectangle implied by the low-energy electron diffraction (LEED) pattern. Accordingly, a more isotropic geometry is proposed that can also be made consistent with the LEED pattern. (30 refs.)

63137 X-ray photoelectron diffraction studies of zinc selenide. E.S.Crawford, S.Evans, E.Raftery, M.D.Scott (Edward Davies Chem. Labs., Univ. Coll. of Wales, Aberystwyth, Wales). *Surf. & Interface Anal. (GB)*, vol.5, no.1, p.28-32 (Feb. 1983). Polar and azimuthal angle-resolved XPS studies of ZnSe layers grown epitaxially on {100} GaAs by H_2 transport of the elements are described. Comparison of the polar X-ray photoelectron diffraction (XPD) patterns obtained for rotation about [110] and [110] axes confirms the dominant influence of structural factors in determining the shape of the patterns. Azimuthal XPD patterns are shown to reflect symmetry properties directly related to the emitting sites, and their use to determine the symmetry of an exposed single-crystal surface is demonstrated. The outermost ~ 100 Å of all the 'as-grown' ZnSe layers were ~ 20 -35% Zn rich. Ar ion bombardment (800 eV, ~ 5 μ A) rapidly restored the surface stoichiometry to within 10% of 1:1. The disorder concurrently introduced resulted in XPS peak broadening without impairment of the polar XPD pattern. Annealing at 300°C in high vacuum removed the disorder without affecting either the stoichiometry or the XPD pattern. It is inferred that split-(100) interstitials are the preferred sites both for atoms displaced by ion bombardment and for the excess Zn initially present. (18 refs.)

63138 Exoemission and the electret effect in lithium niobate crystals. G.I.Rozenman, I.S.Rez, Yu.L.Chepelev, N.B.Angert, E.I.Boikova (Lenin Komsomol Ural Forest Technol. Inst., Sverdlovsk, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.9, p.1162-3 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1890-2 (Sept. 1982). [received: April 1983]

Exoelectron emission is known to occur in ferroelectrics when the pyroelectric effect takes place. The emission is caused by a field whose source is excess pyroelectric charge. It is to be expected that the electret charge as well as the pyroelectric charge may be the cause of the exoemission. Lithium niobate crystals, both pure and doped with vanadium, iron, silicon, molybdenum, and fluorine were studied. The temperature dependence is shown of the intensity of exoelectron emission from the (00-1) and (001) surfaces of a single-domain LiNbO_3 single crystal corresponding to the C^+ and C^- cuts, respectively. From the C^+ cut there is no emission in the temperature ranges -150 to -100°C , $+45$ to $+55^\circ\text{C}$, and above 200°C . From the C^- cut two weak maxima are observed in the first two of those temperature ranges. It is possible that the anomalous behavior of the exoemission is related to an electric field E_1 whose direction is opposite to the pyroelectric field E_p and which is formed when the lithium niobate crystal is heated. The fall-off of the emission current at $+200^\circ\text{C}$ upon heating the C^+ cut is probably due to an increase in the conductivity of the crystal resulting in complete screening of the pyroelectric field. Doping of the samples did not result in any basic change in the nature of the emission current. (6 refs.)

63140 In situ observation of mono-molecular growth steps on crystals growing in aqueous solutions. I. K.Tsukamoto (Inst. of Mineralogy, Petrology & Economic Geology, Tohoku Univ., Sendai, Japan). *J. Cryst. Growth (Netherlands)*, vol.61, no.2, p.199-209 (March 1983).

It is demonstrated that by combining optical phase contrast microscopy with a conventional TV system, mono-molecular spiral growth steps on crystals can be observed during the growth in aqueous solution. The image of the mono-molecular growth steps is stored either in a video tape recorder or through an A/D converter into the floppy disk in a computer. The minimal step height on CdI_2 crystals measured by the in situ interferometry described in a forthcoming paper is about 1.4 nm , which satisfactorily agrees with the mono-molecular growth step height derived from the crystal structure. This observation method has a great advantage in understanding the growth mechanism of crystals in more direct way when the growth rate measurement is coupled. (36 refs.)

63141 An improved method for the measurement of the rates of growth and dissolution of crystals under isothermal conditions. M.Rubbo, J.N.Sherwood (Dept. of Pure & Appl. Chem., Univ. of Strathclyde, Glasgow, Scotland).

J. Cryst. Growth (Netherlands), vol.61, no.2, p.210-14 (March 1983). A volumetric method for the measurement of the isothermal growth and dissolution kinetics of crystals is described. It application to the particular case of the growth of crystals of n-eicosane ($\text{C}_{20}\text{H}_{42}$) from solution in n-dodecane ($\text{C}_{12}\text{H}_{26}$) is discussed and the errors involved in the measurement are defined. (10 refs.)

63142 Growth rate dispersion among ADP crystals formed by primary nucleation. J.Garside, R.I.Ristic (Dept. of Chem. & Biochem. Engng., Univ. Coll. London, London, England).

J. Cryst. Growth (Netherlands), vol.61, no.2, p.215-20 (March 1983). The growth rates of many small ($<0.3 \text{ mm}$) ADP crystals in the [010] and [001] directions have been measured. Significant variations in growth rate between different crystals were observed and this variation can be represented by both a log-normal and a gamma distribution. The magnitude of growth rate variations has been related to the Burton-Cabrera-Frank spiral growth theory. (15 refs.)

63143 A refractometric method for continuous investigation of stirred crystal growth organic solutions. M.Sigelle, J.Flicstein, R.Hierle, J.Badan (CNET PMS/PAB, Bagnaux, France).

J. Cryst. Growth (Netherlands), vol.61, no.2, p.229-34 (March 1983). A continuous refractometric method with a He-Ne laser at $\lambda=6328 \text{ \AA}$ for investigating stirred crystal growth solutions is described. A measurement setup reliable for any long time running experiment was designed, which allows in situ non-destructive characterization of a 60 cm^3 volume cell thermostated at $\pm 0.01^\circ\text{C}$. The theoretical refractive index resolution is $|\Delta n_{\text{min}}|_{\text{th}} = 3 \times 10^{-6}$ while the effects of room temperature, atmospheric pressure, and beam waist broadening due to stirring flow birefringence are negligible. Only long time reproducibility considerations lead to an actual resolution $|\Delta n|_{\text{min}} = 6 \times 10^{-6}$. The capabilities of the system were investigated using a well purified low saturated solution of 3-methyl 4-nitropyridine 1-oxide-acetonitrile at a concentration $C_0 = 2.37 \times 10^{-2}$ mole/mole which is cooled from 34 down to 20°C . It is found that the method can be employed to follow any temperature programming, providing that the elemental segment is not less than $|\Delta T|_{\text{min}} = 0.015^\circ\text{C}$, while concentration changes at constant temperature as low as $\Delta C_{\text{min}} = 0.03 \text{ g/l}$ can be detected. No discontinuity around the solubility point at 29.5°C was noticed. (19 refs.)

63144 Flux growth of SrGa_2O_9 single crystals. F.Haberey (Inst. für Werkstoffe der Elektrotech., Ruhr-Univ. Bochum, Bochum, Germany), R.Leckebusch, M.Rosenberg, K.Sahl.

J. Cryst. Growth (Netherlands), vol.61, no.2, p.284-8 (March 1983). Flux growth and some properties of SrGa_2O_9 single crystals are reported. Li_2MoO_4 , Na_2MoO_4 and Bi_2O_3 were tried as flux components using the slow cooling technique. Only Bi_2O_3 proved to be suitable. Systematic variation in the proportion of starting components (SrCO_3 , Ga_2O_3 , Bi_2O_3) revealed an optimal starting composition (17.5 mole% SrCO_3 , 52.5 mole% Ga_2O_3 and 30 mole% Bi_2O_3). Tabular SrGa_2O_9 crystals up to several mm in diameter were obtained. Chemical, optical and X-ray investigations showed them to be useful substrates of LPE of magnetic hexaferrite layers with magnetoplumbite or related lattice. (10 refs.)

81.10F Growth from melts

63145 Numerical simulation of heat and concentration fields when growing single crystals by the Czochralski method. L.G.Kirillova. *Elektron. Model. (USSR)*, no.2, p.92-5 (March-April 1983). In Russian.

A mathematical model and algorithms are developed which permit the calculation of certain process control parameters to produce single crystals with a preset diameter and definite composition. (6 refs.)

63146 Skull melter single crystal growth of magnetite (Fe_3O_4)-ulvospinel (Fe_2TiO_4) solid solution members. R.Aragon, H.R.Harrison, R.H.McCallister, C.J.Sandberg (Purdue Univ., West Lafayette, IN, USA).

J. Cryst. Growth (Netherlands), vol.61, no.2, p.221-8 (March 1983). A modified Bridgman technique by crucibleless skull melting has been applied to the growth of equiaxed, centimeter sized titanomagnetite $[(\text{Fe}_3\text{O}_4)_{1-x}(\text{Fe}_2\text{TiO}_4)_x]$ single crystals, in oxygen-buffered atmospheres. The relation between atmosphere and spinel phase compositions has been systematically investigated, through characterization by X-ray diffraction, polarized reflected light microscopy and electron microprobe analysis. Guidelines are discussed for generalization of the method to single crystal growth of ferrites of arbitrary composition. (20 refs.)

63147 An experimental model of the flow in Czochralski growth. A.D.W.Jones (School of Math., Univ. of Bristol, Bristol, England).

J. Cryst. Growth (Netherlands), vol.61, no.2, p.235-44 (March 1983). An experiment has been built to model the flow of the melt in Czochralski growth. Water and a mixture of water and glycerol are used as the working fluids and the rates of rotation, temperature differences and dimensions of the apparatus are scaled so that the effects of rotation and buoyancy forces are correctly represented. Observations of the velocity and temperature fields are divided into six flow regimes (I-VI). The investigation of the separate effects of crystal rotation (I), differential rotation (II) and heating (III) leads to a better understanding of the flow due to heating with crystal rotation (IV) and heating with differential rotation (V and VI). It is expected that regimes IV, V and VI will occur during crystal growth. (16 refs.)

63148 The thermal field in a furnace for growing crystals by the Verneuil method. A.P.Chirkin, A.I.Pustyl'nik, O.G.Kapachinskaya (Inst. of Crystallography, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.592-5 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.988-93 (Sept.-Oct. 1982). [received: April 1983]

The authors suggest a method of studying the thermal fields in Verneuil furnaces. They study the distribution of the particles of the charge in the flame of the oxyhydrogen burner when the flow rates of gases and charge are varied. They show that changes in the charge flow rate have a marked influence on the temperature fluctuations at the crystallization front. (8 refs.)

63149 Laser synthesis of V_2O_5 crystals with highly developed surfaces. V.A.Bobyrev, F.V.Bunkin, E.Deli, N.A.Kirichenko, B.S.Luk'yanchuk, L.Nanai, A.V.Simakin, I.Hevesi, G.A.Shafeyev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1267-8 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.1943-4 (Oct. 1982). [received: April 1983]

An investigation was made of the laser synthesis of V_2O_5 crystals with large surface areas (these crystals are used as a catalyst in chemical reactions). It was found that the effective surface area of these crystals could be increased by a factor of 10^3 - 10^4 , which should make the crystals highly useful in chemical engineering. (1 ref.)

63150 Boron-doped GaAs single crystal. A.Kawasaki, K.Tada, T.Kotani, R.Nakai, T.Takebe, S.Murai (Res. & Dev. Group, Sumitomo Electric Industries Ltd., Osaka, Japan), S.Akai, T.Yamaguchi. *Sumitomo Electr. Tech. Rev. (Japan)*, no.22, p.235-42 (Jan. 1983). Describes the LEC (Liquid Encapsulated Czochralski) technique. In this technique, GaAs melt is coated with a liquid encapsulant B_2O_3 (boron oxide), and the GaAs single crystal is pulled up under high pressure of 2-60 atm to constrain decomposition of GaAs. While the B_2O_3 liquid encapsulant is a transparent liquid with high viscosity, it provides a large adiabatic effect so that it is difficult to control the temperature near the solid-liquid interface. Further, the convection of high-pressure gas induced during crystal growth makes temperature control near the solid-liquid interface more difficult. The authors describe a successful attempt to produce GaAs crystal having low dislocation density employing the direct synthesis method of elemental Ga and As in which electrically neutral boron was doped. Since the bond energy between boron and arsenic is larger than that between gallium and arsenic, it is expected that the boron-doped GaAs crystal would have a low dislocation density. (14 refs.)

63151 Single crystal growth and physical properties of cubic $Zn_4O(BO_3)_6$. L.Bohaty, S.Hausuhl, J.Liebertz, S.Stahr (Univ. zu Köln, Köln, Germany). *Z. Kristallogr. (Germany)*, vol.161, no.1-2, p.157-8 (1982). Reports on the suitability of $Zn_4O(BO_3)_6$ for technical applications. Large single crystals were grown by the Czochralski method. The crystals obtained (about 18 mm in diameter and 20 mm long) were of optical quality. The crystals were chemically stable in normal air and quasi-soluble in water. As the electrooptical and piezoelectrical constants are only of the same order of magnitude as those of α -quartz, the crystals are not suited for use in electrooptical modulator devices. However, qualitative measurements of the photoelastic properties showed unexpected high effects which suggest an application for acoustooptical deflection devices. The high mechanical stability, small thermal expansion and small thermoelastic constants will favour such applications. (6 refs.)

63152 Fast silicon-sheet growth with the supported-web method. J.G.Grabmaier, H.Föll, B.Freinstein, K.Geim (Siemens AG, München, Germany).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.976-9

Directly grown Si ribbons or sheets are attractive for the manufacture of low-cost Si solar cells. Intensive research efforts have led to the development of ribbon growth methods that yield products suitable for the manufacture of efficient solar cells. However, the areal growth rates of most methods are rather small and this constitutes a serious obstacle to their large-scale implementation. The newly developed supported-web (S-Web) technique attempts to overcome this problem. It envisions the use of a carbon-fibre net which is pulled through a melt of liquid Si at a high pulling speed. Liquid films or webs of Si are spread out within the meshes of the net and crystallize some time after leaving the melt. In this way the formation and the crystallization of the Si ribbon is decoupled and very large areal growth rates should be possible. First experiments demonstrated the feasibility of this concept and pulling speeds of ≈ 2 m/min have been achieved. Problems exist with respect to the crystalline quality and the topography of the specimens obtained. (7 refs.)

81.10H Zone melting and zone refining

63153 Elimination of boron in silicon by zone melting under a high-frequency inductive plasma: role of reactive plasmas and of slag. Characterisation of photovoltaic silicon. D.Morvan, J.Amouroux, M.C.Charpin (Ecole Nat. Supérieure de Chimie de Paris, Paris, France), H.Lauray. *Rev. Phys. Appl. (France)*, vol.18, no.4, p.239-51 (April 1983). In French. Preparation of photovoltaic silicon requires that one analyses systematically the purity and physical properties of the material. Previous studies show the critical effect of a number of impurities affecting the efficiency of the photocell. Nevertheless there still exists a gap in the studies concerning the chemistry combination which can occur between the impurities appearing during all technic operations of the material. The photovoltaic properties of the same material seem to depend on the different steps of elaboration of a given crystallized structure. Indeed, impurities segregate in the liquid concentrate towards the grain boundaries or react with the protection slag of the crucible giving new chemical boundaries. Among preparation methods for photovoltaic silicon the authors develop the original method of purification of metallurgical grade silicon with a reactive plasma process. This process, which is a liquid-solid, liquid-liquid and liquid-gas extraction, enables one to obtain a polycrystalline silicon having a high purity with crystals measuring 1 mm or slightly more. 63154 Ge-seeded crystallisation on SiO_2 by using a slider system with RF heated strip heater. Y.Ohmachi, T.Nishioka, Y.Shinoda (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).

Electron. Lett. (GB), vol.19, no.8, p.274-5 (14 April 1983).

A slider system has been developed for crystallisation of semiconductor films on SiO_2 . The system consists of a graphite support, graphite strip heater and movable quartz substrate holder. A two heater procedure can be achieved with an RF heating coil. Single-crystal Ge films have been successfully grown over SiO_2 on a Si substrate using a heterolateral epitaxy by seeded solidification technique. (10 refs.)

81.15C Deposition by cathodic sputtering

63155 High-energy particles in AlN film preparation by reactive sputtering technique. K.Tominaga, S.Iwamura, Y.Shintani, O.Tada (Faculty of Engng., Tokushima Univ., Tokushima, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.418-22 (March 1983).

AlN films were prepared by reactive DC-planar magnetron sputtering in atmosphere of N_2 gas or mixed gas of N_2 and H_2 . High-energy neutral particles bombarding the AlN film were observed by using a time-of-flight particle analyzer. It is found that the high-energy particles such as NO and OH (or O) due to residual H_2O in the discharge chamber or oxides at the Al target surface induce the coloring of film, the decrease of optical transmittance at shorter wavelength, the decrease of the degree of c -axis orientation of the film, etc. For the sputtering in mixed gas of N_2 and H_2 , a number of energetic H atoms are bombarding the AlN film. The influence of these energetic H atoms on the film growth is also studied.

63156 Cathode sputtering. II. G.Peto.

Finomtech-Mikrotech. (Hungary), vol.22, no.2, p.51-9 (Feb. 1983). In Hungarian.

For pt.1 see *ibid.*, vol.22, no.1, p.29-32 (1983). Cathode sputtering is a rapidly developing method applied in thin film technology and characterized by an ionic process which is parallel with the layer deposition. This condition may induce particular properties in thin films, so that the use of cathode sputtering predetermines certain layer properties. Cathode sputtering may be described as a combination of three processes: material emission under the effect of ion bombardment, ion source, layer deposition parallel to the ion bombardment. Besides the usual vacuum-technological questions, some new problems emerge on the design of equipment. The cathode sputtering is preferred in microcircuit applications, but in processes requiring very high purity, the evaporation method dominates at present. (4 refs.)

63157 Ion beam sputter deposition of layered magnetic thin films.

J.W.Smits, H.A.Algra, U.Enz, R.P.van Staple (Philips Res. Labs., Eindhoven, Netherlands).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.89-92 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

Magnetic thin films of Ni_2Fe_{21} (Permalloy) alternated with Cu were prepared by ion beam sputtering. Electrostatic deflection of the Ar^+ beam between two targets yields a layered structure. This is evidenced from the X-ray diffractograms which show satellites at intervals corresponding to the superstructure wavelength. FMR measurements show a resonance corresponding to the expected uniform mode, as well as a weak complicated spectrum at higher fields. The latter is connected with an imperfect layer structure. (5 refs.)

63158 High-rate sputter technique. S.Schiller, U.Heisig, K.Goedicke (Forschungsinstitut Manfred von Ardenne, Dresden, Germany).

Vak.-Tech. (Germany), vol.32, no.2, p.35-47 (March 1983). In German.

For some years high-rate sputtering has gained a decisive role among the physical vapour deposition techniques. The state and recent results of this technique are reported. The high-rate sputter sources of today are the result of a stepwise consistent technical development. The present efforts on source development refer to the target shape, the improvement of the material utilization, the long-term stability, and to the adaptation to the special deposition problem. Besides the planar and cylindrical source types a new 'tube plasmatron' is presented. Process research on high-rate sputtering is concentrated on reactive d.c. sputtering. The plant engineering is determined by the tendency to extensive process control, e.g. with the aid of optical spectrometers, and to an in-situ measurement of the film thickness. The application possibilities of high-rate sputtering are demonstrated by examples for the metallization of semiconductors, the manufacturing of transparent conducting layers, the manufacturing of thin film resistances with a high stability, the large-area coating of glass panes with heat-reflecting film systems, and for the deposition of wear-resistant and hard layers. 81.15G Vacuum deposition

63159 Formation of cubic boron nitride films by boron evaporation and nitrogen ion beam bombardment. M.Satou (Government Industrial Res. Inst., Osaka, Japan), F.Fujimoto.

Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L171-2 (March 1983). The resistivity and structure of films deposited on tantalum and rocksalt substrates by the electron beam evaporation of boron and the simultaneous bombardment of 30 keV N_2^+ ion beam were studied. From observation by transmission electron microscope, it was found that cubic boron nitride was produced in the case where the prepared composition rate of boron to nitrogen was 2.5. (5 refs.)

63160 Fabrication of $In_2O_3:SnO_2$ transparent conducting films by electron beam evaporation. R.Nakano, H.Kawasaki, J.Sato, T.Yabumoto. *Res. Rep. Fac. Eng. Meiji Univ. (Japan)*, no.43, p.49-53 (1982). In Japanese. Conductive and transparent thin films of In_2O_3 mixed with 5 wt.% SnO_2 have been prepared by electron beam evaporation using the vacuum system with a high pressure limitation of 1×10^{-4} Torr. The deposited films have a sheet resistance of 15 Ω /sq and transmittance exceeding 90% (550 nm) under preparing condition that O_2 pressure is 2×10^{-5} Torr, deposition rate, 1 Å/s and substrate temperature, 325°C. (5 refs.)

63161 Processes occurring in an erosion plasma during laser vacuum deposition of films. III. Condensation in gas flows during laser vaporization of materials. S.V.Gaponov, A.A.Gudkov, A.A.Fraerman (Inst. of Appl. Phys., Acad. of Sci., Gorki, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.9, p.1130-3 (Sept. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.9, p.1843-8 (Sept. 1982). [received: April 1983]

For pt.II see *Zh. Tekh. Fiz.*, vol.52, no.8, p.1584 (1982). *Sov. Phys. Tech. Phys.*, vol.27, no.8, p.969-73 (1982). A theoretical and experimental study of the possibility of condensed droplets appearing in the erosional flow produced by irradiating targets with millisecond pulses from a neodymium laser is reported ($\lambda=1.06 \mu m$, $\tau_p=6 \times 10^{-4}$ s, $W_p=20$ J, $q_0=10^8$ W/cm 2). The necessary conditions for a condensation discontinuity to occur during the expansion of the high-pressure region into vacuum are formulated. It is revealed that the formation of condensed droplets near the surface of the target is inhibited by the vaporizing action of the radiation incident on and reflected from the target. It is established that a condensation discontinuity is possible in artificially created thermalized regions. The nature of the degradation of the film by the high-energy particles is determined. It is shown that undamaged films of semiconductors and metals can be obtained. (4 refs.)

63162 Characterization of Al-AlO $_3$ and Sn-SnO $_2$ cermet films deposited by reactive evaporation. H.Demiryont (Dept. of Phys., Istanbul Univ., Istanbul, Turkey), N.Tezey.

Thin Solid Films (Switzerland), vol.101, no.4, p.345-56 (25 March 1983).

A new preparation technique called 'reactive evaporation' is discussed with reference to the production of Al-AlO $_3$ and Sn-SnO $_2$ cermet films. Sample properties characterized by the metallic particle concentration within the cermet films were found to depend on the deposition rate, the pressure and the species of residual gas during deposition, the source-substrate distance and substrate temperature. Al-AlO $_3$ cermets exhibits three distinct types of current-voltage characteristic, which can be related to the particle concentration. Ohmic conductivity, switching and memory effect properties and non-linear current-voltage characteristics were observed with Al-AlO $_3$ cermet films independently of the electrode material (aluminum, gold) and the sample thickness (100-1000 Å) when the aluminum particle concentration was decreased. Some general properties of Sn-SnO $_2$ cermet films were studied in relation to the preparation conditions. Microstructure examination by transmission electron microscopy, resistance measurements on SnO $_2$ films prepared in strip and sandwich form and optical transmissivity studies were carried out as functions of time. The effects of moderate heat treatment on the sample properties were also examined. (26 refs.)

63163 Low temperature dielectric films from octavinylsiloxane. V.P.Korchok, T.N.Martynova, V.I.Belyi (Inst. of Inorganic Chem., Novosibirsk, USSR).

Thin Solid Films (Switzerland), vol.101, no.4, p.373-6 (25 March 1983).

The temperature dependence of the equilibrium vapour pressure of volatile organosiloxane octavinylsiloxane (vinyl-T $_8$) was studied by the Knudsen method. Nickel was found to be the best material for the evaporation cell as it does not catalyse polymerization of vinyl-T $_8$. It was found that thin solid films of vinyl-T $_8$ are readily converted into amorphous siloxane polymer dielectric films by argon or nitrogen plasma treatment. (8 refs.)

63164 Continuous deposition of photovoltaic grade CdS sheet at the unit operations scale. R.E.Rochelleau, P.J.Lutz, D.F.Brestovansky, B.N.Baron, T.W.F.Russell (Dept. of Chem. Engng., Univ. of Delaware, Newark, DE, USA).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Siresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.798-803

Uniform photovoltaic grade CdS sheet has been reproducibly deposited on a continuously moving flexible substrate in a reel to reel vacuum coater. Materials characterization by scanning electron microscopy, photoluminescence, and resistivity revealed that continuously deposited CdS is essentially equivalent to material that was deposited for making high efficiency Cu_2S/CdS cells in the laboratory scale process. Cells made using continuously deposited CdS sheet had efficiencies as high as 7.85%. (7 refs.)
